	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test F: The Generator is Noisy

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

The generator is belt-driven by the engine accessory drive system.

Possible Causes

- Accessory drive belt
- Loose bolts/brackets
- Generator/pulley

PINPOINT TEST F: THE GENERATOR IS NOISY

Test Step	Result / Action to Take
F1 CHECK FOR ACCESSORY DRIVE NOISE AND MOUNTING BRACKETS	
• Key in OFF position. • Check the accessory drive belt for damage and correct installation. Refer to Section 303-05 . • Check the accessory mounting brackets and generator pulley for looseness or misalignment.	**Yes** GO to F2 . **No** REPAIR as necessary. TEST the system for normal operation.

• **Is the accessory drive OK?**	
F2 CHECK THE GENERATOR FOR EXCESSIVE ELECTRICAL NOISE	
• Disconnect: Generator C102b. • Key in START position. • With the engine running, determine if the generator is still noisy. • **Is the noise still present?**	**Yes** GO to F3 . **No** INSTALL a new generator. REFER to Section 414-02 . TEST the system for normal operation.
F3 CHECK THE GENERATOR FOR MECHANICAL NOISE	
• Turn all the accessories off. With the engine running, use a stethoscope or equivalent listening device to probe the generator for unusual mechanical noise. • **Is the generator the noise source?**	**Yes** INSTALL a new generator. REFER to Section 414-02 . TEST the system for normal operation. **No** REFER to Section 303-00 to diagnose the source of the engine noise.

Pinpoint Test G: Radio Interference

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

The generator radio suppression equipment reduces interference transmitted through the speakers by the vehicle electrical system.

Possible Causes

- Generator
- Wiring/routing
- In-vehicle entertainment system

PINPOINT TEST G: RADIO INTERFERENCE

Test Step	Result / Action to Take
G1 VERIFY THE GENERATOR IS THE SOURCE OF THE RADIO INTERFERENCE	
NOTE: If the original equipment manufactured (OEM) audio unit has been replaced with an aftermarket unit, the vehicle may not pass this test. Return the vehicle to OEM condition before following this pinpoint test. • Key in START position. • Start and run the engine. • Tune the radio to a station where the interference is present. • Key in OFF position. • Disconnect: Generator C102b. • Key in START position. • With the engine running, determine if the interference is still present. • **Is the interference present with the generator**	**Yes** REFER to Section 415-00 for diagnosis and testing of the in-vehicle entertainment system. **No** INSTALL a new generator. REFER to Section 414-02 . TEST the system for normal operation.

disconnected?	

Component Tests

Battery — Drain Testing

WARNING: Do not attempt this test on a lead-acid battery that has recently been recharged. Explosive gases may cause personal injury. Failure to follow these instructions may result in personal injury.

CAUTION: To prevent damage to the meter, do not crank the engine or operate accessories that draw more than 10 amps.

CAUTION: If equipped with the CD6 audio unit, precautions must be taken when the battery has been disconnected. When reconnecting the battery, make sure no interruption of power occurs for 30 seconds. If power is interrupted during the first 30 seconds, permanent damage to the CD6 audio unit will result.

NOTE: No factory-equipped vehicle should have more than a 50 milliamps (mA) (0.050) amp draw.

NOTE: Many electronic modules draw 10 mA (0.010 amp) or more continuously.

NOTE: Use an in-line ammeter between the negative battery post and its respective cable.

NOTE: Typically, a drain of approximately one amp is attributed to an engine compartment lamp, glove compartment lamp, or interior lamp staying on continually. Other component failures or wiring shorts are located by selectively pulling fuses to pinpoint the location of the current drain. When the current drain is found, the meter reading falls to an acceptable level. If the drain is still not located after checking all the fuses, it is due to the generator.

NOTE: To accurately test the drain on a battery, an in-line ammeter must be used. Use of a test lamp or voltmeter is not an accurate method due to the number of electronic modules.

Check for current drains on the battery in excess of 50 mA (0.050 amp) with all the electrical accessories off and the vehicle at rest for at least 40 minutes. Current drains can be tested with the following procedure:

1. Make sure the battery junction box (BJB) and the auxiliary relay box(es) are accessible without turning on the interior lights or the underhood lights.

2. Drive the vehicle for at least 5 minutes and over 48 km/h (30 mph) to turn on and activate the vehicle systems.

3. Allow the vehicle to sit with the key OFF for at least 40 minutes to allow modules to time out/power down.

4. Connect a fused (30A) jumper wire between the negative battery cable and the negative battery post to prevent modules from resetting and to catch capacitive drains.

5. Disconnect the negative battery cable from the negative battery post without breaking the connection of the jumper wire.

6. **NOTE:** It is very important that continuity is not broken between the battery and the negative battery cable when connecting the meter. If this happens, the entire procedure must be repeated.

Connect the battery tester between the negative battery cable and the post. The meter must be capable of reading milliamps and should have a 10-amp capability.

7. **NOTE:** If the meter settings need to be switched or the test leads need to be moved to another jack, the jumper wire must be reinstalled to avoid breaking continuity.

   NOTE: Amperage draw varies from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference.

   NOTE: No factory-equipped vehicle should have more than a 50 mA (0.050 amp) draw.

   Remove the jumper wire.

8. Note the amperage draw. Draw varies from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference. No factory-equipped vehicle should have more than a 50 mA (0.050 amp) draw.

9. If the draw is found to be excessive, remove the fuses from the CJB one at a time and note the current reading. Do not reinstall fuses until you have finished testing. To correctly isolate each of the circuits, all of the fuses may need to be removed. Then install one fuse, note the amperage draw, remove the fuse and install the next fuse, etc.

10. If the current draw is still excessive, remove the fuses from the auxiliary relay box one at a time and note the current drop. Do not reinstall the fuses until you have finished testing. To correctly isolate each of the circuits, all of the fuses may need to be removed. Then install one fuse, note the amperage draw, remove the fuse and install the next fuse. When the current level drops to an acceptable level after removing a fuse, the circuit containing the excessive draw has been located.

11. Check the wiring diagrams for any circuits that run from the battery without passing through the auxiliary relay box or the BJB. If the current draw is still excessive, disconnect these circuits until the draw is found. Also disconnect the generator electrical connections if the draw can not be located. The generator may be internally shorted, causing the current drain.

Generator On-Vehicle Tests

CAUTION: To prevent damage to the generator, do not make jumper wire connections except as directed.

CAUTION: Do not allow any metal object to come in contact with the housing and the internal diode cooling fins with the key in the ON or OFF positions. A short circuit may result and burn out the diodes.

NOTE: Battery posts and cable clamps must be clean and tight for accurate meter indications.

NOTE: Refer to the battery tester manual for complete directions for testing the charging system.

1. Turn off all lamps and electrical components.

2. Place the transmission in NEUTRAL and apply the parking brake.

3. Carry out the Load Test and No Load Test according to the following component tests:

Generator On-Vehicle Tests — Load Test

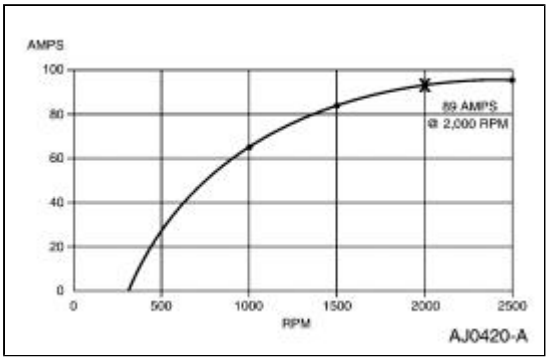
1. Switch the tester to the ammeter function.

2. Connect the positive and negative leads of the tester to the corresponding battery terminals.

3. Connect the current probe to the generator B+ output terminal, circuit SDC02 (RD).

4. With the engine running at approximately 2,000 rpm, adjust the tester load bank to determine the output of the generator. Generator output should be greater than the graph shown below. If not, refer to the pinpoint test or GO to Symptom Chart .

Expedition And Navigator



Generator On-Vehicle Tests — No Load Test

1. Switch the tester to the voltmeter function.

2. Connect the voltmeter positive lead to the generator B+ terminal, circuit SDC02 (RD) and the negative lead to ground.

3. Turn all of the electrical accessories off.

4. With the engine running at approximately 2,000 rpm, check the generator output voltage. The voltage should be between 13.2 and 15.5 volts. If not, refer to the pinpoint test or GO to Symptom Chart .

Battery and Cables

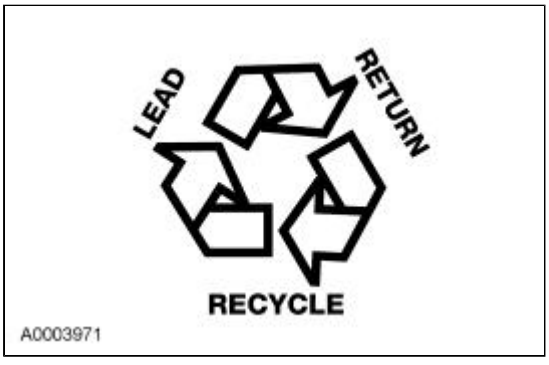
Printable View (73 KB)

Vehicles are equipped with a 12-volt maintenance-free battery.

The battery and cable system consists of the following components:

- Battery
- Battery cable assembly
- Battery tray

Ford Motor Company strongly recommends that lead-acid batteries be returned to an authorized recycling facility for disposal.



Battery

Printable View (91 KB)

Special Tool(s)

ST2442-A	Micro 490 Digital Battery Analyzer 162-00004 or equivalent

Principles of Operation

Battery Eye Operation

The purpose of the battery eye is to indicate the state of charge of the battery in the assembly plant and while on the dealership lot. The battery eye can also indicate the state-of-charge when the vehicle is delivered to the dealership and during the pre-delivery inspection process. The battery eye is made up of a viewing plate, 2 balls and a small passage. The balls indicate the specific gravity of the electrolyte by floating higher or lower in the passageway. It is important to note that the battery eye checks the specific gravity on only a single battery cell.

The color of the battery eye indicates the approximate state of charge.

- Red usually indicates the battery state-of-charge is at 40% or less.
- Yellow indicates the battery state-of-charge is between 40% and 57%.
- Green indicates the battery state-of-charge is above 57%.
- No color/black can occur after the battery has been in service for several years and some of the plate material has coated the balls.
- A clear battery eye can occur if the battery case becomes damaged and the electrolyte has fallen below the plates.

NOTE: The battery eye may remain red for a period of time (up to several days), even after the battery is fully charged, because the acid is not yet fully mixed.

Do not replace a battery based solely on the indication of the battery eye. The battery eye color simply indicates the battery state-of-charge, not its condition. For example, a red or yellow battery eye usually indicates the battery is discharged, not defective. If the battery eye indicates the battery may be discharged, it is necessary to recharge the battery before testing its condition.

Charging a Battery

Batteries discharge while the vehicle is on the dealer lot or parked by the customer for an extended period of time due to normal parasitic key-off loads. Also, vehicles still in dealer inventory or in long-term storage may be driven short distances with heavy electrical loads. Over a period of time (30 days or more), this could result in vehicles having shallow or deeply discharged batteries.

- Deeply discharged — A battery that is drained over a prolonged period of time, such as an unsold vehicle or a vehicle in storage, to the point the battery is dead.
- Shallow discharge — A battery that is drained by leaving an accessory on for several hours or a few days and has a very low charge.

The vehicle's charging system is designed to supply the electrical power needed to maintain the battery near full charge during normal vehicle use. The charging system is not capable of bringing a deeply discharged battery back near full charge in a short amount of time such as allowing the vehicle to idle for 15 minutes to "recharge the battery." Discharged batteries should be charged using an external charger.

NOTE: Battery chargers have improved greatly with the addition of the new generation pulse chargers. These chargers pulse current into the battery, breaking down the sulfation layer on the battery plates and generally reduce charging times to less than an hour.

NOTE: Cold batteries will not readily accept a charge. Therefore, batteries should be allowed to warm to approximately 5°C (41°F) before charging. This may require 4 to 8 hours at room temperature.

The following chart summarizes 2 recommended methods of charging.

Type of Battery Discharge	Pulse Charger	Standard Charger
Deeply discharged	Follow directions supplied with the pulse charger	2 to 8 hours and may take up to an hour to accept initial charge
Shallow discharge	45 minutes to an hour charge	2 hours (40A) on manual setting or medium automatic setting

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

   Visual Inspection Chart

Mechanical	Electrical
• Battery • Battery mounting	• Battery cables • Battery posts

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the fault is not visually evident, Go To Pinpoint Test A .

Pinpoint Tests

Pinpoint Test A: Battery Condition Test

Normal Operation

Battery condition is determined by measuring battery terminal voltage after a specific discharge current is applied for a specified time period.

Possible Causes

- Battery charge
- Battery

PINPOINT TEST A: BATTERY CONDITION TEST

Test Step	Result / Action to Take
A1 TEST THE BATTERY CONDITION	
NOTE: No battery with a red test-eye should be replaced. The red eye only means the battery is discharged, not necessarily defective. **NOTE:** Failure to fully charge the battery before retesting may cause false readings. ● Verify the battery condition using the battery analyzer. ● **Is the battery OK?**	**Yes** If the meter reads GOOD BATTERY, RETURN the battery to service. If the meter reads GOOD-RECHARGE, CHARGE the battery and RETURN it to service. If the meter reads CHARGE & RETEST, fully CHARGE and RETEST the battery. **No** If the meter reads REPLACE BATTERY, INSTALL a new battery. If the meter reads BAD CELL-REPLACE, INSTALL a new battery.

Battery Disconnect

Printable View (81 KB)

WARNING: Batteries normally produce explosive gases. Therefore, do not allow flames, sparks, or lighted substances to come near the battery. When charging or working near a battery, always shield your face and protect your eyes. Always provide adequate ventilation. Failure to follow these instructions may result in personal injury.

WARNING: To avoid accidental deployment and possible injury, the backup power supply must be depleted before repairing or installing any front air bag or side air curtain supplemental restraint system (SRS) components and before repairing, installing, adjusting or striking components near the front air bag or side air curtain sensors, such as the doors, instrument panel, console, door latches, strikers, seats and hood latches. To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect the auxiliary batteries and power supplies (if equipped). Failure to follow these instructions may result in personal injury.

WARNING: When lifting a battery, excessive pressure on the end walls could cause acid to spew through the vent caps, resulting in personal injury. Lift with a battery carrier or with your hands on opposite corners. Failure to follow these instructions may result in personal injury.

WARNING: Keep batteries out of the reach of children. Batteries contain sulfuric acid. Avoid contact with skin, eyes or clothing. Also, shield your eyes when working near the battery to protect against possible splashing of the acid solution. In case of acid contact with the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in personal injury.

CAUTION: If equipped with the CD6 audio unit, precautions must be taken when the battery has been disconnected. When reconnecting the battery, make sure no interruption of power occurs for 30 seconds. If power is interrupted during the first 30 seconds, permanent damage to the CD6 audio unit will result.

NOTE: When the battery (or powertrain control module [PCM]) is disconnected and connected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The charging system setpoint may also vary. The vehicle may need to be driven to relearn its strategy.

1. **CAUTION: Do not lift the battery ground terminal by grabbing onto the wire.**

   Disconnect the battery negative cable.
   - To connect, tighten to 5 Nm (44 lb-in).

2. **CAUTION: Do not lift the positive battery terminal by grabbing onto the wire or lifting underneath the terminal cover.**

   Disconnect the positive battery cable.
   - To connect, tighten to 9 Nm (80 lb-in).

3. **CAUTION: Do not tap, press or excessively push on the battery terminals.**

NOTE: Make sure the battery terminals slide all of the way down the battery post and is not tilted.

To connect, reverse the disconnect procedure.

Battery and Battery Tray — Exploded View

14	—	Battery ground cable-to-body terminal (part of 14B060)
15	—	Battery cable harness in-line electrical connector (part of 14B060)
16	14B060	Battery cable harness assembly

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery. For additional information, refer to Battery Disconnect in this section.

3. Remove the nut and position the battery ground cable terminal aside at the starter.
   - To install, tighten to 25 Nm (18 lb-ft).

4. Remove the nut and position the starter solenoid positive cable terminal aside.
   - To install, tighten to 12 Nm (9 lb-ft).

5. Remove the nut and position the starter solenoid wire terminal aside.
   - To install, tighten to 5 Nm (44 lb-in).

6. Remove the 2 nuts and position the 2 battery cable harness brackets from the A/C compressor mounting bolts.
   - To install, tighten to 10 Nm (89 lb-in).

7. Remove the bolt and position the battery ground cable-to-frame terminal aside.
   - To install, tighten to 15 Nm (11 lb-ft).

8. Remove the nut and position the generator harness terminal and the CJB cable terminal aside.
   - To install, tighten to 9 Nm (80 lb-in).

9. Remove the bolt and position the battery ground cable-to-cowl panel terminal aside.
   - To install, tighten to 12 Nm (9 lb-ft).

10. Disconnect the battery cable harness in-line electrical connector, release the harness locator and remove the battery cable harness assembly.

11. To install, reverse the removal procedure.

Removal and Installation

CAUTION: Do not allow any metal object to come in contact with the generator housing and internal diode cooling fins. A short circuit may result and burn out the diodes.

1. Disconnect the battery. For additional information, refer to Section 414-01 .
2. For Navigator, release the 2 retainers and remove the engine cover.
3. Remove the air cleaner intake pipe. For additional information, refer to Section 303-12 .
4. Rotate the front end accessory drive belt tensioner counterclockwise and position the accessory drive belt aside.
5. Remove the harness locator from the generator bracket.
6. Remove the 4 bolts and the generator bracket.
   - To install, tighten to 10 Nm (89 lb-in).
7. Remove the 2 bolts and position the generator aside.
   - Tighten to 25 Nm (18 lb-ft).
8. Disconnect the generator electrical connector.
9. Position the generator B+ protective cover aside, remove and discard the nut, then position the generator B+ terminal aside.
   - Install a new B+ terminal nut; tighten to 8 Nm (71 lb-in).
10. Remove the generator.
11. To install, reverse the removal procedure.

Audio System

Printable View (430 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

Audio Unit

The audio unit can be operated while the key is in RUN or ACC. The accessory delay feature allows the audio unit to be operated for a preset period of time after the key is moved to OFF and a front door has not been opened. The audio unit sends AC voltage audio signals to the speakers or to the amplifier, depending on vehicle configuration. The audio unit can produce its own DTCs, which can be communicated to the scan tool through the medium speed controller area network (MS-CAN), or can be retrieved through the audio unit self-test by simultaneously pressing presets 3 and 6. The audio unit communicates via the MS-CAN.

Satellite Audio

The satellite audio system consists of a satellite radio receiver, a satellite radio antenna, and an antenna cable. The satellite radio antenna receives digital audio signals and sends them to the satellite radio receiver, where the signals are converted and sent to the auxiliary audio module (or the DVD player, if equipped). The satellite radio receiver communicates via the MS-CAN.

Antenna — AM/FM

The combination AM/FM antenna is located on the right rear quarter-glass. An antenna amplifier is used to amplify the signals to the audio unit. The AM/FM antenna cannot be replaced separately from the quarter glass.

Subwoofer

The Audiophile subwoofer and amplifier are integral. The subwoofer in the THX® audio system is powered by the THX® amplifier. The enable/clip detection circuit carries out 2 functions: to turn the amplifier on, and to indicate to the audio unit when the subwoofer output distortion signal reaches a damaging level. The audio unit then clips the audio output signal to prevent damage to the subwoofer.

Auxiliary Audio Module

The auxiliary audio module allows rear-seat users to select audio functions. It allows for single/dual-play mode. The auxiliary audio module communicates via the MS-CAN.

Digital Versatile Disc (DVD) Player

When a video disc is inserted into the DVD player and the PLAY button is pressed, an image is displayed on the screen and a stereo signal is transmitted to the audio unit. The DVD player allows for single/dual-play mode. The DVD player communicates via the MS-CAN.

Single-Play Mode

In single-play mode, any audio input routed through the auxiliary audio module (or DVD player) is broadcast through all of the vehicle speakers. These audio inputs include the DVD player and peripheral gaming devices plugged into the auxiliary audio module (or DVD player).

Dual-Play Mode (All Audio Systems Except THX®)

In dual-play mode, the audio unit continues to control the output to the front speakers, while the auxiliary audio module (or DVD player) controls the audio to the rear speakers and headphones.

Dual-Play Mode (THX®)

In dual-play mode, the audio unit continues to control all of the vehicle speakers. The auxiliary audio module (or DVD player) controls the audio output to the headphones only.

THX® Audio System

The THX® audio system provides theatre quality sound in the vehicle. Audio signals are sent to the THX® amplifier, which processes the audio signals and sends them to the 12 speakers: 4 door speakers, 2 tweeter speakers, 3 front/center speakers, 2 D-pillar tweeters, and a subwoofer. The THX® amplifier communicates via the MS-CAN.

Navigation

The navigation audio unit generates a display on a video screen. When an on-screen menu key is pressed, a new screen is displayed corresponding to the key that was pressed. The navigation audio unit is available with the THX® or Audiophile sound systems. For additional information on the navigation system, refer to Section 419-07 .

Steering Wheel Controls

The steering wheel controls consist of a series of resistors. Each steering wheel control switch function corresponds with a specific resistance value within the switch. When a switch is pressed, the audio unit monitors the change in reference voltage to determine the requested function.

Audio Input Jack

The audio input jack allows for a portable MP3 player to be connected to the vehicle audio system. When a portable MP3 player is connected, audio from the MP3 player can be played through the vehicle speakers.

Noise Suppression Equipment

The radio frequency suppression equipment reduces interference transmitted through the speakers by the engine ignition and electrical systems. When installing any new radio suppression equipment components, make sure that a good contact is made at all connections.

Network Communication

The following audio system components communicate via the MS-CAN:

- Audio unit
- Navigation audio unit
- Satellite radio receiver
- Auxiliary audio module
- DVD player
- THX® amplifier

The following messages are utilized by the audio system:

Message	Transmitting Module	Receiving Module(s)	Audio System Function
Ignition Switch Position	Instrument Cluster	Audio Unit Satellite Radio Receiver Digital Versatile Disc (DVD) Player THX® Amplifier	Indicates ignition switch position for power-up/shut-down.
Backlight Dimmer	Smart Junction Box (SJB)	Audio Unit DVD Player Auxiliary Audio Module	Controls the backlight intensity, based on the position of the dimmer switch.
Transmission Gear Selected	Instrument Cluster	Audio Unit	With the vehicle in REVERSE (R), the audio unit mutes the speaker output when a reverse parking aid tone is sounded (if equipped). For navigation system, this signal is used for more accurate navigation tracking.
Delayed Accessory Status	SJB	Audio Unit DVD Player Auxiliary Audio Module	When active, this signal allows the audio component to be operated after the vehicle is shut off.
Engine RPM Data	Instrument Cluster	Audio Unit THX® Amplifier	Used by the audio unit (or THX® amplifier) for the speed-compensated volume function.
Steering Wheel Position	Instrument Cluster	Audio Unit	For navigation system, this signal is used for more accurate navigation tracking.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Audio unit
• Antenna
• Digital versatile disc (DVD) player
• Auxiliary audio module
• Steering wheel controls
• Audio input jack
• Speaker(s)
• Noise suppression equipment
	• Smart junction box fuse(s):
	  ▪ 3 (15A) (satellite radio receiver/DVD player power)
	  ▪ 28 (5A) (audio unit hot in START)
	  ▪ 38 (20A) (subwoofer power) (Audiophile only)
	  ▪ 38 (20A) (amplifier power) (THX® only)
	  ▪ 39 (20A) (audio unit hot at all times)
	  ▪ 40 (20A) (amplifier power) (THX® only)
	• Circuitry

3. If the fault is visually evident, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. **NOTE:** Do not press any buttons on the audio unit while the audio unit is carrying out the self-test.

   Carry out the network test:
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the audio unit.

9. If the DTCs retrieved are related to the concern, go to the Audio Unit Diagnostic Trouble Code (DTC) Chart, the THX® Amplifier Diagnostic Trouble Code (DTC) Chart, the Digital Versatile Disc (DVD) Player Diagnostic Trouble Code (DTC) Chart, the Auxiliary Audio Module Diagnostic Trouble Code (DTC) Chart or the Satellite Radio Receiver Diagnostic Trouble Code (DTC) Chart.

10. If no DTCs related to the concern are retrieved, go to the Speaker Walk-Around Test, the Audio Unit Self-Diagnostic Mode, or the Satellite Audio Bezel Diagnostic Test.

Speaker Walk-Around Test

NOTE: To enter the speaker walk-around test or audio unit self-diagnostic mode, the audio unit must be turned on and in radio tuner mode (AM/FM).

1. To enter the speaker walk-around test, simultaneously press the audio unit preset buttons 3 and 6.

2. The speaker walk-around test stops at each speaker and applies sound to each speaker for about 1 to 2 seconds. Each speaker is tested and displayed on the audio unit in the following sequence:
    - Except THX®: RF, LF, LR, RR, SUBWOOFER
    - THX®: CSA FRONT, TWEETER LF, TWEETER RF, CENTER REAR, SPEAKER LF, SPEAKER RF, SPEAKER LR, SUBWOOFER, SPEAKER RR

3. To exit the speaker walk-around test, turn the key to OFF, turn the audio unit off, or press preset button 1 for diagnostics.

Audio Unit Self-Diagnostic Mode

NOTE: To enter the audio unit self-diagnostic mode, the audio unit must be turned on and in radio tuner mode (AM/FM).

1. To enter the following tests, press the desired preset button while in the speaker walk-around test or while in the audio unit self-diagnostic mode.

2. The self-diagnostic mode has the following functions available:
    - Preset button 1 = On-Demand Self-Test. This button runs the on-demand self-test.
        - Pressing the MENU DOWN button allows scrolling of any DTCs found during the test while in this menu.
    - Preset button 2 = Display Continuous DTCs. This button enables viewing of any continuous DTCs that have been logged.
        - Pressing the MENU UP button allows scrolling of any DTCs while in this menu.
        - While continuous DTCs are being displayed, pressing the EJECT button will clear all present DTCs.
    - Preset button 3 = Signal Strength Test. This button displays the signal strength.
    - Preset button 4 = Software Version Display. This button displays the audio unit software version.
        - Pressing the MENU UP button allows scrolling of all audio subsystem software versions while in this menu.
    - Preset button 5 = Display Test. This test illuminates all the display segments for 5 seconds, then turns all segments off.
    - Preset button 6 = Configuration Status. This button enables audio unit configuration status.
        - Pressing the MENU button displays the audio unit part number while in this menu.

3. To exit the self-diagnostic mode, turn the audio unit off or turn the key to OFF.

4. If the concern remains and the fault is not detected, GO to Symptom Chart to continue diagnostics.

Satellite Audio Bezel Diagnostic Test

NOTE: To enter the satellite audio bezel diagnostic test, the audio unit must be on and in SAT mode.

1. To enter the satellite audio bezel diagnostic test, simultaneously press and hold the AUX button and preset button 2 (except navigation), or press SOUND and preset button 1 (navigation).

2. Upon entering the self-test, the audio unit produces 2 continuously alternating tones of different pitch, one for the right channel, then one for the left.

3. The test continues by displaying any DTCs currently present. If no DTCs are present, NO DTCS will be displayed. If there are DTCs present, the audio unit will auto-scroll through the list of active DTCs.

4. Historical DTCs can be viewed by pressing the AUX button and preset button 2 simultaneously while in the active DTC mode.
    - If any DTCs are present, pressing the AUX button and preset button 2 will prompt CLEAR DTCS? on the audio unit.
    - To clear historical DTCs, press preset buttons 1, 2, and 3 consecutively within 4 seconds.
    - To exit historical DTCs (with or without clearing DTCs), press the AUX button and preset button 2 simultaneously.

5. If no historical DTCs are present, pressing the AUX button and preset button 2 simultaneously while in active DTC mode will display the DLP software version.

6. To exit the satellite audio bezel diagnostic test, press the AUX button and preset button 2 simultaneously while the DLP software version is displayed, or turn the audio unit off.

7. If the concern remains and the fault is not detected, GO to Symptom Chart .

Audio Unit Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1117	Audio Steering Wheel Button Stuck	VERIFY no steering wheel control buttons are stuck and that no steering wheel control buttons are pressed during the self-test. CLEAR the DTCs. REPEAT the self-test. If DTC B1117 is retrieved again, Go To Pinpoint Test J .
B1119	Audio Disc DVD Player Thermal Shutdown	ALLOW the audio unit to cool. DISREGARD the DTC. CLEAR the DTCs. REPEAT the self-test.
B1136	Audio Steering Wheel Switch #2 Circuit Failure	Go To Pinpoint Test J .
B1140	Map Disk Invalid	REFER to Section 419-07 to continue diagnosis of the navigation system.
B1154	Subwoofer #1 Short to Ground	Go To Pinpoint Test F .
B1155	Subwoofer #1 Short to Battery	Go To Pinpoint Test F .
B1318	Battery Voltage Low	CLEAR the DTCs. REPEAT the self-test. If DTC B1318 is retrieved again, REFER to Section 414-00 to diagnose the low battery voltage condition.
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
B2103	Antenna Not Connected	Go To Pinpoint Test A .
B2204	GPS Antenna Connection Open or Short	REFER to Section 419-07 to continue diagnosis of the navigation system.
B2274	Phone Transceiver Active Circuit Failure	DTC is not applicable. The vehicle is not equipped with cellular phone functionality. DISREGARD the DTC. CLEAR the DTCs. REPEAT the self-test.
B2384	Audio Reverse Park Aid Mute Ckt Failure	VERIFY the audio unit is configured to receive the vehicle speed signal through the medium speed controller area network (MS-CAN).

		REFER to Section 418-01 .
B2404	Audio Steering Wheel Switch Circuit Fault	Go To Pinpoint Test J .
B2405	Audio Disc CD Player Thermal Shutdown Fault	ALLOW the audio unit to cool. DISREGARD the DTC. CLEAR the DTCs. REPEAT the self-test.
B2406	Audio Disc CD Player Internal Fault	CLEAR the DTCs. REPEAT the self-test. If DTC B2406 is retrieved again, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
B2477	Module Configuration Failure	REFER to Section 418-01 to diagnose the module configuration.
B2633	Driver-Front Microphone Circuit Failure	Go To Pinpoint Test N .
B2656	DVD (Digital Versatile Disk) Error	INSERT a known good navigation map DVD. CLEAR the DTCs. REPEAT the self-test. If DTC B2656 is retrieved again, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
B2913	Audio Subwoofer Not Connected	Go To Pinpoint Test F .
B2924	Audio Button Stuck	VERIFY no audio unit buttons are stuck and that no audio unit button is pressed during the self-test. CLEAR the DTCs. REPEAT the self-test. If DTC B2924 is retrieved again, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
B2965	Audio System Speaker Circuit Fault	For vehicles with bench seat, Go To Pinpoint Test B . For vehicles without bench seat or THX® audio system, Go To Pinpoint Test C . For vehicles with THX® audio system, Go To Pinpoint Test D .
C1992	Vehicle Speed Circuit Failure	VERIFY the audio unit is configured to receive the vehicle speed signal through the MS-CAN. REFER to Section 418-01 .
P0812	Reverse Input Circuit	VERIFY the audio unit is configured to receive the reverse input signal through the MS-CAN. REFER to Section 418-01 .
U0140	Lost Communication With Body Control Module (GEM)	**NOTE:** Diagnose DTC B1318 (if present) before diagnosing this DTC. VERIFY the operation of the illumination system and the accessory delay. ■ If the illumination system or the accessory delay does not operate correctly, REFER to Section 413-00 (illumination) or Section 501-11 (accessory delay). ■ If the illumination system and the accessory delay operate correctly, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	**NOTE:** Diagnose DTC B1318 (if present) before diagnosing this DTC. CARRY OUT the smart junction box (SJB) self-test. ■ If DTC U0155 is present in both the audio unit and the SJB, INSTALL a new instrument cluster. REFER to Section 413-

		01 . CLEAR the DTCs. REPEAT the self-test. ■ If DTC U0155 is only present in the audio unit, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
U0159	Lost Communication With Parking Assist Control Module (PAM)	DISREGARD the DTC. CLEAR the DTCs. REPEAT the self-test.
U0193	Lost Communication With Digital Audio Control Module (SDARS)	Go To Pinpoint Test K .
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	Go To Pinpoint Test G .
U0197	Lost Communication With Telephone Control Module	DISREGARD the DTC. CLEAR the DTCs. REPEAT the self-test.
U0238	Lost Communication With Digital Audio Control Module "D" (DSP)	Go To Pinpoint Test E .
U0249	Lost Communication With Entertainment Control Module - Rear "B" (RCU)	GO to Symptom Chart .
U2050	No Application Present	CONFIGURE the audio unit. REFER to Section 418-01 . REPEAT the self-test. If DTC U2050 is retrieved again, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
U2051	One or More Calibration Files Missing/Corrupt	CONFIGURE the audio unit. REFER to Section 418-01 . REPEAT the self-test. If DTC U2051 is retrieved again, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
U2473	Unexpected Vehicle Speed (VSS)	REFER to Section 419-07 to continue diagnosis of the navigation system.

THX® Amplifier Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1158	Subwoofer #2 Open	Go To Pinpoint Test D .
B1317	Battery Voltage High	CLEAR the DTCs. REPEAT the self-test. If DTC B1317 is retrieved again, REFER to Section 414-00 to diagnose the over-charging condition.
B1318	Battery Voltage Low	CLEAR the DTCs. REPEAT the self-test. If DTC B1318 is retrieved again, REFER to Section 414-00 to diagnose the low battery voltage condition.
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new THX® amplifier. REFER to Section 415-01 . TEST the system for normal operation.

B2477	Module Configuration Failure	REFER to Section 418-01 to diagnose the module configuration.
B2913	Audio Subwoofer Not Connected	Go To Pinpoint Test D .
B2925	Subwoofer Speaker Short Circuit	Go To Pinpoint Test D .
B292A	Subwoofer #2 Speaker Short Circuit	Go To Pinpoint Test D .
B2965	Audio System Speaker Circuit Fault	Go To Pinpoint Test D .
C1992	Vehicle Speed Circuit Failure	DISREGARD the DTC. CLEAR the DTCs. REPEAT the self-test.
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	**NOTE:** Diagnose DTC B1318 (if present) before diagnosing this DTC. CARRY OUT the smart junction box (SJB) self-test. ■ If DTC U0155 is present in both the THX® amplifier and the SJB, INSTALL a new instrument cluster. REFER to Section 413-01 . CLEAR the DTCs. REPEAT the self-test. ■ If DTC U0155 is only present in the THX® amplifier, INSTALL a new THX® amplifier. REFER to Section 415-01 . TEST the system for normal operation.
U0184	Lost Communication With Radio (ACM)	GO to Symptom Chart
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	Go To Pinpoint Test G .
U2050	No Application Present	CONFIGURE the THX® amplifier. REFER to Section 418-01 . REPEAT the self-test. If DTC U2050 is retrieved again, INSTALL a new THX® amplifier. REFER to Section 415-01 . TEST the system for normal operation.
U2051	One or More Calibration Files Missing/Corrupt	CONFIGURE the THX® amplifier. REFER to Section 418-01 . REPEAT the self-test. If DTC U2051 is retrieved again, INSTALL a new THX® amplifier. REFER to Section 415-01 . TEST the system for normal operation.

Digital Versatile Disc (DVD) Player Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1119	Audio Disc DVD Player Thermal Shutdown	ALLOW the DVD player to cool. DISREGARD the DTC. CLEAR the DTCs. REPEAT the self-test.
B111F	LCD Thermal Shutdown	ALLOW the DVD player to cool. DISREGARD the DTC. CLEAR the DTCs. REPEAT the self-test.
B1317	Battery Voltage High	CLEAR the DTCs. REPEAT the self-test. If DTC B1317 is retrieved again, REFER to Section 414-00 to diagnose the over-charging condition.
B1318	Battery Voltage Low	CLEAR the DTCs. REPEAT the self-test. If DTC B1318 is retrieved again, REFER to Section 414-00 to diagnose the low battery voltage condition.
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved

		again, REMOVE the DVD player and SEND it to an authorized audio system repair facility. REFER to Section 415-07 . TEST the system for normal operation after the repair.
B2477	Module Configuration Failure	REFER to Section 418-01 to diagnose the module configuration.
B2656	DVD (Digital Versatile Disk) Error	INSTALL a known good DVD into the DVD player. CLEAR the DTCs. REPEAT the self-test. If DTC B2656 is still present, REMOVE the DVD player and SEND it to an authorized audio system repair facility. TEST the system for normal operation after the repair.
B2924	Audio Button Stuck	VERIFY no DVD player buttons are stuck and that no DVD player button is pressed during the self-test. CLEAR the DTCs. REPEAT the self-test. If DTC B2924 is retrieved again, REMOVE the DVD player and SEND it to an authorized audio system repair facility. REFER to Section 415-07 . TEST the system for normal operation after the repair.
U0140	Lost Communication With Body Control Module (GEM)	**NOTE:** Diagnose DTC B1318 (if present) before diagnosing this DTC. VERIFY the operation of the illumination system and the accessory delay. ■ If the illumination system or the accessory delay does not operate correctly, REFER to Section 413-00 (illumination) or Section 501-11 (accessory delay). ■ If the illumination system and the accessory delay operate correctly, REMOVE the DVD player and SEND it to an authorized audio system repair facility. REFER to Section 415-07 . TEST the system for normal operation after the repair.
U0184	Lost Communication With Radio (ACM)	GO to Symptom Chart .
U0193	Lost Communication With Digital Audio Control Module (SDARS)	Go To Pinpoint Test K .
U2050	No Application Present	CONFIGURE the DVD player. REFER to Section 418-01 . REPEAT the self-test. If DTC U2050 is retrieved again, REMOVE the DVD player and SEND it to an authorized audio system repair facility. REFER to Section 415-07 . TEST the system for normal operation after the repair.

Auxiliary Audio Module Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1318	Battery Voltage Low	CLEAR the DTCs. REPEAT the self-test. If DTC B1318 is retrieved again, REFER to Section 414-00 to diagnose the low battery voltage condition.
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new auxiliary audio module. REFER to Section 415-01 . TEST the system for normal operation after the repair.
B2477	Module Configuration Failure	REFER to Section 418-01 to diagnose the module configuration.
B2924	Audio Button Stuck	VERIFY no rear audio controls button is stuck and that no rear audio controls button is pressed during the self-test. CLEAR the DTCs. REPEAT the self-test. If DTC B2924 is retrieved again, INSTALL a new auxiliary audio module. REFER to Section 415-01 . TEST the

		system for normal operation.
U0140	Lost Communication With Body Control Module (GEM)	**NOTE:** Diagnose DTC B1318 (if present) before diagnosing this DTC. VERIFY the operation of the illumination system and the accessory delay. ■ If the illumination system or the accessory delay does not operate correctly, REFER to Section 413-00 (illumination) or Section 501-11 (accessory delay). ■ If the illumination system and the accessory delay operate correctly, INSTALL a new auxiliary audio module. REFER to Section 415-01 . TEST the system for normal operation.
U0184	Lost Communication With Radio (ACM)	GO to Symptom Chart .
U0193	Lost Communication With Digital Audio Control Module (SDARS)	Go To Pinpoint Test K .
U2050	No Application Present	CONFIGURE the auxiliary audio module. REFER to Section 418-01 . REPEAT the self-test. If DTC U2050 is retrieved again, INSTALL a new auxiliary audio module. REFER to Section 415-01 . TEST the system for normal operation after the repair.

Satellite Radio Receiver Diagnostic Trouble Code (DTC) Chart

NOTE: While running the satellite audio bezel diagnostic test, DTCs contain the characters "SAT" after the 5-digit DTC.

DTC	Description	Action
B1031	SDARS Satellite Antenna Open	Go To Pinpoint Test L .
B1032	SDARS Satellite Antenna Short	Go To Pinpoint Test L .
B1318	Battery Voltage Low	CLEAR the DTCs. REPEAT the self-test. If DTC B1318 is retrieved again, REFER to Section 414-00 to diagnose the low battery voltage condition.
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, REMOVE the satellite radio receiver and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
B2477	Module Configuration Failure	REFER to Section 418-01 to diagnose the module configuration.
U0184	Lost Communication With Radio (ACM)	GO to Symptom Chart .
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	Go To Pinpoint Test G .
U0197	Lost Communication With Telephone Control Module	DISREGARD the DTC. CLEAR the DTCs. REPEAT the self-test.
U0249	Lost Communication With Entertainment Control	GO to Symptom Chart .

	Module - Rear "B" (RCU)	
U0255	Lost Communication With Front Controls Interface Module	DISREGARD the DTC. CLEAR the DTCs. REPEAT the self-test.
U0256	Lost Communication With Front Display Interface Module	DISREGARD the DTC. CLEAR the DTCs. REPEAT the self-test.
U2050	No Application Present	CONFIGURE the satellite radio receiver. REFER to Section 418-01 . REPEAT the self-test. If DTC U2050 is retrieved again, REMOVE the satellite radio receiver and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the audio unit	• Fuse • Circuitry • Audio unit	• REFER to Section 418-00 .
• No communication with the satellite radio receiver	• Fuse • Circuitry • Satellite radio receiver	• REFER to Section 418-00 .
• No communication with the THX® amplifier	• Fuse • Circuitry • THX® amplifier	• REFER to Section 418-00 .
• No communication with the digital versatile disc (DVD) player	• Fuse • Circuitry • DVD player	• REFER to Section 418-00 .
• No communication with the auxiliary audio module	• Fuse • Circuitry • Auxiliary audio module	• REFER to Section 418-00 .
• The satellite audio is inoperative/does not operate correctly	• Circuitry • Auxiliary audio module (if equipped) • DVD player (if equipped) • Satellite radio receiver • Audio unit	• Go To Pinpoint Test K .
• The navigation audio unit is inoperative/does not operate correctly	• Circuitry • Audio unit	• REFER to Section 419-07 .
• The video system is inoperative/does not operate correctly — no video	• Damaged DVD • DVD player	• VERIFY a good DVD is inserted into the DVD player. TEST the system for normal operation. If the concern is still present, REMOVE the DVD player and SEND it to an

		authorized audio system repair facility. REFER to Section 415-07 . TEST the system for normal operation after the repair.
• The video system does not operate correctly — no audio	• Circuitry • DVD player • Audio unit	• Go To Pinpoint Test G .
• The audio unit display is blank, but the audio unit operates	• Audio unit	• REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
• The audio unit backlighting does not operate correctly	• Circuitry • Module configuration • Audio unit	• VERIFY the audio unit is configured for network-based illumination. ▪ If the audio unit is configured correctly, REFER to Section 413-00 , to continue diagnosis of a single illumination source inoperative. ▪ If the audio unit is not configured correctly, CONFIGURE the audio unit. REFER to Section 418-01 . TEST the system for normal operation.
• During CD mode, the audio unit displays: NO CD	• Damaged CD • Audio unit	• INSERT a known good CD. If the concern is still present, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
• Poor reception — AM/FM	• Circuitry • Antenna • Antenna cable • Charging system • Ignition system • Noise suppression equipment • Antenna module • Audio unit	• Go To Pinpoint Test A .
• Poor reception — satellite audio	• Obstructions to the line of sight	• DRIVE the vehicle to an open area and TEST the reception. ▪ If the reception is OK, INFORM the customer that the satellite signal can be affected by obstructions to the

	• Satellite antenna • Satellite antenna cable • Satellite radio receiver	satellite antenna line of sight. ▪ If the reception is not OK, Go To Pinpoint Test L . • Go To Pinpoint Test L .
• Continuous seek/scan in AM/FM	• RDS function setting • Antenna cable • Noise suppression equipment • Antenna • Audio unit	• VERIFY the RDS is set to ALL. SCAN for a good channel. ▪ If a good channel is found, the cause of the concern was that no RDS channel in the selected category was found. The system is OK. ▪ If no good channel is found, Go To Pinpoint Test A . • Go To Pinpoint Test A .
• Poor quality/distorted/no sound from one or more speakers (not all speakers) — vehicles with bench seat	• Circuitry • Speaker • Audio unit	• Go To Pinpoint Test B .
• Poor quality/distorted/no sound from one or more speakers (not all speakers) — vehicles without bench seat or THX® audio system	• Circuitry • Speaker • Auxiliary audio module (if equipped) • DVD player (if equipped) • Audio unit	• Go To Pinpoint Test C .
• Poor quality/distorted/no sound from one or more speakers (not all speakers) — THX®	• Fuse • Circuitry • Speaker • Subwoofer • THX® amplifier • Audio unit	• Go To Pinpoint Test D .
• Poor quality/distorted/no sound from all speakers — except THX® audio system	• Circuitry • Audio unit	• With the key in RUN, MEASURE the voltage between the audio unit C240a-15, circuit CBP28 (GY/VT), harness side and ground. ▪ If voltage is present, REPAIR the circuit. TEST the system for

		normal operation. ■ If no voltage is present, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
• No sound from all speakers — THX® audio system	• Fuse • Circuitry • THX® amplifier • Audio unit	• Go To Pinpoint Test E .
• The subwoofer is inoperative/does not operate correctly — except THX®	• Fuse • Circuitry • Subwoofer • Audio unit	• Go To Pinpoint Test F .
• The subwoofer is inoperative/does not operate correctly — THX®	• Fuse • Circuitry • Speaker • Subwoofer • THX® amplifier • Audio unit	• Go To Pinpoint Test D .
• No auxiliary headphones audio — all audio systems except THX®	• Headphones • Auxiliary audio module • DVD player	• INSTALL a set of known good headphones and OPERATE the audio system in radio tuner mode. ■ If the system operates correctly, the concern was caused by inoperative headphones. ■ If the system does not operate correctly and the vehicle has a DVD player, REMOVE the DVD player and SEND it to an authorized audio system repair facility. REFER to Section 419-07 . TEST the system for normal operation after the repair. ■ If the system does not operate correctly and the vehicle does not have a DVD player, INSTALL a new auxiliary audio module. REFER to Section 415-01 . TEST the system for normal operation.
• No auxiliary headphone audio — THX®	• Circuitry • Headphones • Auxiliary audio module • DVD player	• Go To Pinpoint Test H .

• Loud popping sound when cycling the ignition	• Fuse • Circuitry • Subwoofer (Audiophile) • THX® amplifier • Audio unit	• Go To Pinpoint Test I .
• The steering wheel controls are inoperative/do not operate correctly	• Circuitry • Clockspring • Steering wheel controls • Audio unit	• Go To Pinpoint Test J .
• Voice recognition is inoperative/does not operate correctly	• Fuse • Circuitry • Steering wheel controls • Microphone (part of the interior rear view mirror) • Audio unit	• Go To Pinpoint Test N .
• The speed sensitive volume does not operate correctly.	• Instrument cluster • Audio unit	• CHECK for audio unit DTCs. ▪ If DTC U0155 is present, REFER to the Audio Unit Diagnostic Trouble Code (DTC) Chart in this section. ▪ If no DTCs related to the concern are present, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
• The audio input jack is inoperative/does not operate correctly	• Circuitry • Audio input jack • Audio unit	• Go To Pinpoint Test M .

Pinpoint Tests

Pinpoint Test A: Poor Reception — AM/FM

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The radio antenna, integral to the right quarter glass, receives AM and FM radio waves. The antenna module, which receives voltage from the audio unit through circuit CME13 (YE/OG), sends the radio waves to the audio unit through the antenna cable.

The noise suppression equipment reduces engine ignition and electrical systems interference transmitted through the speakers.

DTC B2103 — sets when an open is detected in the antenna circuit.

Possible Causes

- Circuit CME13 (YE/OG) open or short to ground
- Antenna
- Antenna cable
- Charging system
- Ignition system
- Antenna module
- Noise suppression equipment
- Audio unit

PINPOINT TEST A: POOR RECEPTION — AM/FM

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
A1 CHECK THE DTCs	
• Review the audio unit DTCs from the self-test. • **Is DTC B2103 present?**	**Yes** GO to A8 . **No** GO to A2 .
A2 CHECK THE AUDIO UNIT RECEPTION	
• Check the audio unit reception with the engine running, and with the engine off. • **Does the poor reception only occur with the engine running?**	**Yes** GO to A3 . **No** GO to A8 .
A3 CHECK THE NOISE SUPPRESSION EQUIPMENT	
• Check all required noise suppression equipment and the radio frequency interference suppression bond for security, cleanliness, and metal-to-metal contact. • **Are the connections clean, secure, and in metal-to-metal contact?**	**Yes** GO to A4 . **No** CLEAN and SECURE the antenna connections, or INSTALL new noise suppression equipment as needed. TEST the system for normal operation.
A4 CHECK THE CAPACITOR MOUNTING AND CONNECTING CIRCUITS	
• **NOTE:** The capacitor mounting points are used to complete the electrical circuit and must be mounted securely to clean surfaces. • Check the mounting and connecting circuits of the radio ignition interference capacitor for security, cleanliness, and metal-to-metal contact. • **Are the contacts clean, secure, and in metal-to-metal**	**Yes** GO to A5 . **No** CLEAN and SECURE the connections, or INSTALL a new radio ignition interference

contact?	capacitor as necessary. TEST the system for normal operation.
A5 CHECK THE RADIO INTERFERENCE CAPACITOR	
• Check the operation of the radio interference capacitor by installing a known good component. • Start the vehicle. • Operate the audio unit in radio tuner mode. • **Is the reception OK?**	**Yes** INSTALL a new radio interference capacitor. TEST the system for normal operation. **No** INSTALL the original radio interference capacitor. GO to A6 .
A6 CHECK THE GENERATOR	
• Key in OFF position. • Check the generator by disconnecting the wiring harness from the voltage regulator. • Start the engine. • Operate the audio unit in radio tuner mode. • **Is the reception OK?**	**Yes** INSTALL a new generator. REFER to Section 414-02 . TEST the system for normal operation. **No** GO to A7 .
A7 CHECK THE IGNITION CIRCUITS	
• Key in OFF position. • Connect the wiring harness to the voltage regulator. • Check the ignition circuits for correct routing, grounding, and integrity of the connections. • **Are the ignition components OK?**	**Yes** USE a jumper cable to ground various parts of the vehicle to the frame (for example: engine, fenders, quarter panels, stone deflectors, air cleaner, body sheet metal). When the noise is eliminated, PROVIDE a permanent ground where necessary. TEST the system for normal operation. **No** REPAIR the ignition system as necessary. TEST the system for normal operation.
A8 CHECK CIRCUIT CME13 (YE/OG) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Antenna Module C9021a. • Operate the audio unit in radio tuner mode. • Measure the voltage between the antenna module C9021a-1, circuit CME13 (YE/OG), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to A10 . **No** GO to A9 .

A9 CHECK CIRCUIT CME13 (YE/OG) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Audio Unit C240a. • Measure the resistance between the audio unit C240a-5, circuit CME13 (YE/OG), harness side and the antenna module C9021a-1, circuit CME13 (YE/OG), harness side; and between the audio unit C240a-5, circuit CME13 (YE/OG), harness side and ground.  N0040888 • **Is the resistance less than 5 ohms between the audio unit and the antenna module, and greater than 10,000 ohms between the audio unit and ground?**	**Yes** GO to A15 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A10 CHECK THE ANTENNA GRID	
• Key in OFF position. • Inspect the antenna grid closely for signs of damage. • **Is the antenna grid OK?**	**Yes** GO to A11 . **No** REPAIR the antenna grid as necessary. REFER to Section 501-11 . TEST the system for normal operation.
A11 ISOLATE THE ANTENNA MODULE	
• Key in OFF position. • Substitute the antenna module for a known good antenna module. • Operate the audio unit in radio tuner mode. • **Is the reception OK?**	**Yes** INSTALL a new antenna module. REFER to Section 415-02 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL the original antenna module. GO to A12 .
A12 SUBSTITUTE THE ANTENNA LEAD-IN CABLE	
• Key in OFF position. • Substitute a known good antenna lead-in cable. • Operate the audio unit in radio tuner mode. • **Is the reception OK?**	**Yes** INSTALL a new antenna lead-in cable. REFER to Section 415-02 . CLEAR the DTCs. REPEAT the self-test. **No** GO to A13 .
A13 SUBSTITUTE THE AUDIO UNIT	
• Key in OFF position. • Substitute a known good audio unit. • Operate the audio unit in radio tuner mode. • **Is the reception OK?**	**Yes** SEND the original audio unit to an authorized audio system repair facility. TEST the system for normal operation after the repair.

	No INSTALL the original audio unit. GO to A14 .
A14 REPOSITION THE COMPONENTS	
• Key in OFF position. • Determine if the noise can be eliminated by repositioning the antenna extension cable, audio speaker circuits, or audio unit power feed circuits away from other circuits and/or brackets. • Start the vehicle. • Operate the audio unit in radio tuner mode. • **Is the reception OK?**	**Yes** Permanently REPOSITION the components as needed. TEST the system for normal operation. **No** GROUND various parts of the vehicle to the frame (for example: engine, fenders, quarter panels, stone deflectors, body sheet metal) using a jumper cable. When the reception is OK, PROVIDE a permanent ground where necessary. TEST the system for normal operation.
A15 CHECK FOR CORRECT AUDIO UNIT OPERATION	

• Key in OFF position.
• Disconnect all the audio unit connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the audio unit connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: Poor Quality/Distorted/No Sound From One Or More Speakers (Not All Speakers) — Vehicles With Bench Seat

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The audio unit directs the audio signals to the speakers through separate positive and negative circuits for each of the 4 audio channels: LH front, RH front, LH rear, and RH rear. The audio unit provides internal circuit protection for shorts to ground or shorts to voltage. The tweeter speakers are wired in series with the door speakers.

DTC B2965 — sets when an open, a short to ground, or a short to voltage is detected on the front door or rear door speaker circuits. The DTC may not set due to a circuit fault in the tweeter speaker circuits.

Possible Causes

- Circuit RME07 (WH/BN) open, short to ground or voltage
- Circuit RME08 (GY/OG) open, short to ground or voltage
- Circuit RME09 (BN/YE) open, short to ground or voltage

- Circuit RME10 (WH/OG) open, short to ground or voltage
- Circuit RME11 (YE/OG) open, short to ground or voltage
- Circuit RME12 (BN/BU) open, short to ground or voltage
- Circuit VME07 (WH) open, short to ground or voltage
- Circuit VME08 (GN/OG) open, short to ground or voltage
- Circuit VME09 (BN/GN) open, short to ground or voltage
- Circuit VME10 (WH/VT) open, short to ground or voltage
- Circuit VME11 (VT/OG) open, short to ground or voltage
- Circuit VME12 (BN/WH) open, short to ground or voltage
- Speaker
- Audio unit

PINPOINT TEST B: POOR QUALITY/DISTORTED/NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS) — VEHICLES WITH BENCH SEAT

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

RH rear	C240a-10	C802-1	VME12 (BN/WH)
	C240a-23	C802-2	RME12 (BN/BU)

- **Are the resistances less than 5 ohms between the audio unit and the speaker, and greater than 10,000 ohms between the audio unit and ground?**

Yes
GO to B9 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

B5 CHECK FOR VOLTAGE TO THE SUSPECT TWEETER SPEAKER

- Key in OFF position.
- Disconnect: Suspect Tweeter Speaker.
- Operate the audio unit in radio tuner mode.
- Measure the AC voltage between the suspect tweeter speaker pin 1 and pin 2, harness side as follows:

Yes
INSTALL a new speaker for the suspect tweeter speaker. REFER to Section 415-03 . CLEAR the DTCs. REPEAT the

Suspect Speaker	Connector-Pin/ Circuit	Connector-Pin/ Circuit
LH tweeter	C513-1 VME08 (GN/OG)	C513-2 RME08 (GY/OG)
RH tweeter	C613-1 VME11 (VT/OG)	C613-2 RME11 (YE/OG)

- **Is a fluctuating AC voltage present?**

self-test.

No
GO to B6 .

B6 CHECK THE TWEETER SPEAKER CIRCUITS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: LF Speaker C523b or RF Speaker C612b.
- Key in ON position.
- Measure the voltage between the suspect tweeter speaker, harness side and ground as follows:

Suspect Tweeter Speaker	Tweeter Speaker Connector-Pin	Circuit
LH tweeter	C513-1	VME08 (GN/OG)
	C513-2	RME08 (GY/OG)
RH tweeter	C613-1	VME11 (VT/OG)
	C613-2	RME11 (YE/OG)

- **Is any voltage present?**

Yes
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

No
GO to B7 .

B7 CHECK THE TWEETER SPEAKER CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the suspect tweeter speaker, harness side and the respective door speaker, harness side; and between the suspect tweeter speaker, harness side and ground as follows:

Suspect Tweeter Speaker	Tweeter Speaker Connector- Pin	Door Speaker Connector- Pin	Circuit
LH tweeter	C513-1	C523b-1	VME08 (GN/OG)
	C513-2	C523b-2	RME08 (GY/OG)
RH tweeter	C613-1	C612b-1	VME11 (VT/OG)
	C613-2	C612b-2	RME11 (YE/OG)

- **Is the resistance less than 5 ohms between the suspect tweeter speaker and the door speaker, and greater than 10,000 ohms between the suspect tweeter speaker and ground?**

Yes
GO to B8 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

B8 ISOLATE THE DOOR SPEAKER

• Connect: Suspect Tweeter Speaker. • Install a known good door speaker for the door with the suspect tweeter speaker. • Operate the audio unit in radio tuner mode. • **Does the tweeter speaker operate correctly?**	**Yes** INSTALL a new door speaker. REFER to Section 415-03 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new tweeter speaker. REFER to Section 415-03 . CLEAR the DTCs. REPEAT the self-test.
B9 CHECK FOR CORRECT AUDIO UNIT OPERATION	

• Key in OFF position.
• Disconnect all the audio unit connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the audio unit connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: Poor Quality/Distorted/No Sound From One Or More Speakers (Not All Speakers) — Vehicles Without Bench Seat or THX® Audio System

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The audio unit directs audio signals to the front door speakers and to the auxiliary audio module or digital versatile disc (DVD) player (if equipped). The tweeter speakers are wired in series with the front door speakers. The rear door speakers receive audio signals through the auxiliary audio module (or DVD player).

DTC B2965 — sets when an open, a short to ground, or a short to voltage is detected on the front door or rear door speaker circuits. The DTC may not set due to a circuit fault in the tweeter speaker circuits.

Possible Causes

- Circuit RME07 (WH/BN) open, short to ground or voltage
- Circuit RME08 (GY/OG) open, short to ground or voltage
- Circuit RME09 (BN/YE) open, short to ground or voltage
- Circuit RME10 (WH/OG) open, short to ground or voltage
- Circuit RME11 (YE/OG) open, short to ground or voltage
- Circuit RME12 (BN/BU) open, short to ground or voltage
- Circuit VME07 (WH) open, short to ground or voltage
- Circuit VME08 (GN/OG) open, short to ground or voltage
- Circuit VME09 (BN/GN) open, short to ground or voltage
- Circuit VME10 (WH/VT) open, short to ground or voltage

- Circuit VME11 (VT/OG) open, short to ground or voltage
- Circuit VME12 (BN/WH) open, short to ground or voltage
- Speaker
- Auxiliary audio module
- DVD player
- Audio unit

PINPOINT TEST C: POOR QUALITY/DISTORTED/NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS) — VEHICLES WITHOUT BENCH SEAT OR THX® AUDIO SYSTEM

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

	C3077-12 or C949-12	RME12 (BN/BU)

- **Is any voltage present?**

Yes
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

No
GO to C5 .

C5 CHECK THE AUDIO UNIT OUTPUT CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the audio unit and the auxiliary audio module (or DVD player), harness side; and between the audio unit, harness side and ground as follows:

Suspect Speaker	Audio Unit Connector-Pin	Auxiliary Audio Module (or DVD Player) Connector-Pin	Circuit
LH rear	C240a-9	C3077-27 or C949-27	VME09 (BN/GN)
	C240a-22	C3077-28 or C949-28	RME09 (BN/YE)
RH rear	C240a-10	C3077-11 or C949-11	VME12 (BN/WH)
	C240a-23	C3077-12 or C949-12	RME12 (BN/BU)

- **Is the resistance less than 5 ohms between the audio unit and the auxiliary audio module (or DVD player), and greater than 10,000 ohms between the audio unit and ground?**

Yes
GO to C14 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C6 CHECK THE REAR SPEAKER CIRCUITS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Suspect Speaker.
- Key in ON position.
- Measure the voltage between the suspect speaker, harness side and ground as follows:

Suspect Speaker	Connector-Pin	Circuit

Yes
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

No
GO to C7 .

LH rear	C702-1 C702-2	VME12 (BN/WH) RME12 (BN/BU)
RH rear	C802-1 C802-2	VME12 (BN/WH) RME12 (BN/BU)

- **Is any voltage present?**

C7 CHECK THE REAR SPEAKER CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the suspect speaker, harness side and the auxiliary audio module (or DVD player), harness side; and between the suspect speaker, harness side and ground as follows:

Suspect Speaker	Speaker Connector-Pin	Auxiliary Audio Module (or DVD Player) Connector- Pin	Circuit
LH rear	C3077-30 or C949-30	C702-1	VME09 (BN/GN)/ VME12 (BN/WH)
	C3077-29 or C949-29	C702-2	RME09 (BN/YE)/ RME12 (BN/BU)
RH rear	C3077-14 or C949-14	C802-1	VME12 (BN/WH)
	C3077-13 or C949-13	C802-2	RME12 (BN/BU)

- **Is the resistance less than 5 ohms between the suspect speaker and the auxiliary audio module (or DVD player), and greater than 10,000 ohms between the suspect speaker and ground?**

Yes
If equipped with an auxiliary audio module, GO to C15 .

If equipped with a DVD player, GO to C16 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C8 CHECK THE FRONT SPEAKER CIRCUITS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Audio Unit C240a.
- Key in ON position.
- Measure the voltage between the suspect speaker, harness side and ground as follows:

Suspect Speaker	Connector-Pin/ Circuit	Connector-Pin/ Circuit
LH front	C523a-1 C523a-2	VME07 (WH) RME07 (WH/BN)
RH front	C612a-1 C612a-2	VME10 (WH/VT) RME10 (WH/OG)

- **Is any voltage present?**

Yes
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

No
GO to C9 .

C9 CHECK THE FRONT SPEAKER CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the audio unit, harness side and the suspect speaker, harness side; and between the audio unit, harness side and ground as follows:

Suspect Speaker	Audio Unit Connector- Pin	Speaker Connector- Pin	Circuit
LH front	C240a-8	C523a-1	VME07 (WH)
	C240a-21	C523a-2	RME07 (WH/BN)
RH front	C240a-11	C612a-1	VME10 (WH/VT)
	C240a-12	C612a-2	RME10 (WH/OG)

- **Is the resistance less than 5 ohms between the audio unit and the suspect speaker, and greater than 10,000 ohms between the audio unit and ground?**

Yes
GO to C14 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C10 CHECK FOR VOLTAGE TO THE SUSPECT TWEETER SPEAKER

- Key in OFF position.
- Disconnect: Suspect Tweeter Speaker.
- Operate the audio unit in radio tuner mode.
- Measure the AC voltage between the suspect tweeter speaker pin 1 and pin 2, harness side as follows:

Suspect Speaker	Connector-Pin/ Circuit	Connector-Pin/ Circuit
LH tweeter	C513-1 VME08 (GN/OG)	C513-2 RME08 (GY/OG)
RH tweeter	C613-1 VME11 (VT/OG)	C613-2 RME11 (YE/OG)

- **Is a fluctuating AC voltage present?**

Yes
INSTALL a new speaker for the suspect tweeter speaker. REFER to Section 415-03 . CLEAR the DTCs. REPEAT the self-test.

No
GO to C11 .

C11 CHECK THE TWEETER SPEAKER CIRCUITS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: LF Speaker C523b or RF Speaker C612b.
- Key in ON position.
- Measure the voltage between the suspect tweeter speaker, harness side and ground as follows:

Suspect Tweeter Speaker	Tweeter Speaker Connector-Pin	Circuit
LH tweeter	C513-1	VME08 (GN/OG)
	C513-2	RME08 (GY/OG)
RH tweeter	C613-1	VME11 (VT/OG)
	C613-2	RME11 (YE/OG)

Yes
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

No
GO to C12 .

- **Is any voltage present?**

C12 CHECK THE TWEETER SPEAKER CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the suspect tweeter speaker, harness side and the respective door speaker, harness side; and between the suspect tweeter speaker, harness side and ground as follows:

Suspect Tweeter Speaker	Tweeter Speaker Connector- Pin	Door Speaker Connector- Pin	Circuit
LH tweeter	C513-1	C523b-1	VME08 (GN/OG)
	C513-2	C523b-2	RME08 (GY/OG)
RH tweeter	C613-1	C612b-1	VME11 (VT/OG)
	C613-2	C612b-2	RME11 (YE/OG)

- **Is the resistance less than 5 ohms between the suspect tweeter speaker and the door speaker, and greater than 10,000 ohms between the suspect tweeter speaker and ground?**

Yes
GO to C13 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C13 ISOLATE THE DOOR SPEAKER

- Connect: Suspect Tweeter Speaker.
- Install a known good door speaker for the door with the suspect tweeter speaker.
- Operate the audio unit in radio tuner mode.
- **Does the tweeter speaker operate correctly?**

Yes
INSTALL a new door speaker. REFER to Section 415-03 . CLEAR the DTCs. REPEAT the self-test.

No
INSTALL a new tweeter speaker. REFER to Section 415-03 . CLEAR the DTCs. REPEAT the self-test.

C14 CHECK FOR CORRECT AUDIO UNIT OPERATION

- Key in OFF position.
- Disconnect all the audio unit connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the audio unit connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

Yes
REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

C15 CHECK FOR CORRECT AUXILIARY AUDIO MODULE OPERATION	

• Key in OFF position.
• Disconnect the auxiliary audio module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the auxiliary audio module connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new auxiliary audio module. REFER to Section 415-01 . TEST the system for normal operation after the repair.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

C16 CHECK FOR CORRECT DVD PLAYER OPERATION	

• Key in OFF position.
• Disconnect the DVD player connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the DVD player connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	REMOVE the DVD player and SEND it to an authorized audio system repair facility. REFER to Section 415-07 . TEST the system for normal operation after the repair.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: Poor Quality/Distorted/No Sound From One Or More Speakers (Not All Speakers) — THX®

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The audio unit directs the audio signals to the THX® amplifier, which processes the audio signals and sends them to the speakers. Each speaker has a signal and return circuit.

NOTE: The rear tweeters are wired in series with each other. A concern in circuits RME30 (VT/BN), VME30 (GN/BN) or VME47 (BN/VT), or a concern in either speaker, may cause poor/distorted/no sound in both speakers.

DTC B1158 — sets when an open is detected in the RH subwoofer circuit.

DTC B2913 — sets when an open is detected in the LH subwoofer circuit.

DTC B2925 — sets when a short to ground or voltage is detected in the LH subwoofer circuit.

DTC B292A — sets when a short to ground or voltage is detected in the RH subwoofer circuit.

DTC B2965 — sets when an open, short to ground, or short to voltage is detected on any of the speaker circuits.

Possible Causes

- Fuse
- Circuit GD114 (BK/BU) open
- Circuit RME01 (GY) open, short to ground or voltage
- Circuit RME02 (YE) open, short to ground or voltage

PINPOINT TEST D: POOR QUALITY/DISTORTED/NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS) — THX®

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
D1 CHECK CIRCUITS SBP38 (BN/RD) AND SBP40 (VT/RD) FOR VOLTAGE	
• Key in OFF position. • Disconnect: THX® Amplifier C2364a.	**Yes** GO to D2 .

- Measure the voltage between the THX® amplifier, harness side and ground as follows:

THX® Amplifier Connector-Pin	Circuit
C2364a-9	SBP38 (BN/RD)
C2364a-10	SBP38 (BN/RD)
C2364a-11	SBP40 (VT/RD)
C2364a-12	SBP40 (VT/RD)

- **Are the voltages greater than 10 volts?**

No
VERIFY the smart junction box (SJB) fuse 38 (20A) or fuse 40 (20A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

D2 CHECK CIRCUIT GD114 (BK/BU) FOR AN OPEN

- Measure the resistance between the THX® amplifier, harness side and ground as follows:

THX® Amplifier Connector-Pin	Circuit
C2364a-22	GD114 (BK/BU)
C2364a-23	GD114 (BK/BU)
C2364a-24	GD114 (BK/BU)

- **Are the resistances less than 5 ohms?**

Yes
GO to D3 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

D3 CHECK THE AUDIO SIGNALS TO THE THX® AMPLIFIER

- Disconnect: THX® Amplifier C2364c.
- Operate the audio unit in radio tuner mode.
- Measure the AC voltage between the audio circuits at the THX® amplifier as follows:

Suspect Speaker Bank	THX® Amplifier Connector-Pin	Circuit
LH	C2364c-1	VME07 (WH)
	C2364c-2	RME07 (WH/BN)
RH	C2364c-3	VME10 (WH/VT)
	C2364c-4	RME10 (WH/OG)

- **Is a fluctuating AC voltage present?**

Yes
GO to D6 .

No
GO to D4 .

D4 CHECK THE AUDIO CIRCUITS TO THE THX® AMPLIFIER FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Audio Unit C240a.
- Key in ON position.
- Measure the voltage between the THX® amplifier, harness side and ground as follows:

THX® Amplifier Connector-Pin	Circuit
C2364c-1	VME07 (WH)
C2364c-2	RME07 (WH/BN)
C2364c-3	VME10 (WH/VT)
C2364c-4	RME10 (WH/OG)

Yes
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

No
GO to D5 .

- **Is any voltage present?**

D5 CHECK THE AUDIO CIRCUITS TO THE THX® AMPLIFIER FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the THX® amplifier, harness side and the audio unit, harness side; and between the THX® amplifier, harness side and ground as follows:

THX® Amplifier Connector-Pin	Audio Unit Connector-Pin	Circuit
C2364c-1	C240a-8	VME07 (WH)
C2364c-2	C240a-21	RME07 (WH/BN)
C2364c-3	C240a-11	VME10 (WH/VT)
C2364c-4	C240a-12	RME10 (WH/OG)

- **Is the resistance less than 5 ohms between the THX® amplifier and the audio unit, and greater than 10,000 ohms between the THX® amplifier and ground?**

Yes
GO to D10 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

D6 CHECK THE AUDIO SIGNALS TO THE SUSPECT SPEAKER

NOTE: The rear tweeters are wired in series, so the signal voltage must be checked with both speakers disconnected and the measurements made between the LR tweeter C4337-1 and the RR tweeter C4338-2.

- Key in OFF position.
- Connect: THX® Amplifier C2364a.
- Connect: THX® Amplifier C2364c.
- Disconnect: Suspect Speaker.
- Operate the audio unit in radio tuner mode.
- Measure the AC voltage between the suspect speaker pins, harness side as follows:

Suspect Speaker	Speaker Connector-Pin/ Circuit	Speaker Connector-Pin/ Circuit
LH subwoofer	C4212-1 VME01 (GN)	C4212-2 RME01 (GY)
LR door	C702-1 VME12 (BN/WH)	C702-2 RME12 (BN/BU)
LF door	C570-1 VME07 (WH)	C570-2 RME07 (WH/BN)
LH tweeter	C513-1 VME08 (GN/OG)	C513-2 RME08 (GY/OG)
LH front imaging	C2359-1 VME28 (BN/VT)	C2359-4 RME28 (BN/GN)
Center front imaging	C2359-2 VME15 (GN/BU)	C2359-5 RME15 (GY/BU)
RH front imaging	C2359-3 VME29 (GN/WH)	C2359-6 RME29 (BU/WH)
RH tweeter	C613-1 VME11 (VT/OG)	C613-2 RME11 (YE/OG)

Yes
INSTALL a new speaker for the suspect speaker. REFER to Section 415-03 . CLEAR the DTCs. REPEAT the self-test.

No
GO to D7 .

RF door	C647-1 VME10 (WH/VT)	C647-2 RME10 (WH/OG)
RR door	C802-1 VME12 (BN/WH)	C802-2 RME12 (BN/BU)
RH subwoofer	C4212-3 VME02 (VT)	C4212-4 RME02 (YE)
Rear tweeters	C4337-1 VME30 (GN/BN)	C4330-2 RME30 (VT/BN)

- **Is a fluctuating AC voltage present?**

D7 CHECK THE CIRCUITS TO THE SUSPECT SPEAKER FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: THX® Amplifier C2364a or C2364b.
- Key in ON position.
- Measure the voltage between the suspect speaker, harness side and ground as follows:

Suspect Speaker	Speaker Connector-Pin	Speaker Connector-Pin
LR door	C702-1 C702-2	VME12 (BN/WH) RME12 (BN/BU)
LF door	C570-1 C570-2	VME07 (WH) RME07 (WH/BN)
LH tweeter	C513-1 C513-2	VME08 (GN/OG) RME08 (GY/OG)
LH front imaging	C2359-1 C2359-4	VME28 (BN/VT) RME28 (BN/GN)
Center front imaging	C2359-2 C2359-5	VME15 (GN/BU) RME15 (GY/BU)
RH front imaging	C2359-3 C2359-6	VME29 (GN/WH) RME29 (BU/WH)
RH tweeter	C613-1 C613-2	VME11 (VT/OG) RME11 (YE/OG)
RF door	C647-1 C647-2	VME10 (WH/VT) RME10 (WH/OG)
RR door	C802-1 C802-2	VME12 (BN/WH) RME12 (BN/BU)
RR tweeter	C4338-1 C4338-2	VME47 (BN/VT) RME30 (VT/BN)
LR tweeter	C4337-1 C4337-2	VME30 (GN/BN) VME47 (BN/VT)
RH subwoofer	C4212-3 C4212-4	VME02 (VT) RME02 (YE)
LH subwoofer	C4212-1 C4212-2	VME01 (GN) RME01 (GY)

Yes
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

No
GO to D8 .

- **Is any voltage present?**

D8 CHECK THE CIRCUITS TO THE SUSPECT SPEAKER FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the suspect speaker, harness side and the THX® amplifier, harness side; and between the suspect speaker, harness side and ground as follows:

Suspect Speaker	Speaker Connector-Pin	THX® Amplifier Connector-Pin	Circuit
LR door	C702-1	C2364a-7	VME12 (BN/WH)/VME39 (GN/BN)
	C702-2	C2364a-6	RME12 (BN/BU)/RME39 (GY/BN)
LF door	C570-1	C2364a-3	VME07 (WH)
	C570-2	C2364a-2	RME07 (WH/BN)
LH tweeter	C513-1	C2364b-9	VME08 (GN/OG)
	C513-2	C2364b-10	RME08 (GY/OG)
LH front imaging	C2359-1	C2364b-2	VME28 (BN/VT)
	C2359-4	C2364b-1	RME28 (BN/GN)
Center front imaging	C2359-2	C2364b-4	VME15 (GN/BU)
	C2359-5	C2364b-3	RME15 (GY/BU)
RH front imaging	C2359-3	C2364b-6	VME29 (GN/WH)
	C2359-6	C2364b-5	RME29 (BU/WH)
RH tweeter	C613-1	C2364b-11	VME11 (VT/OG)
	C613-2	C2364b-12	RME11 (YE/OG)
RF door	C647-1	C2364a-5	VME10 (WH/VT)
	C647-2	C2364a-4	RME10 (WH/OG)
RR door	C802-1	C2364a-18	VME12 (BN/WH)/VME40 (BU/WH)
	C802-2	C2364a-19	RME12 (BN/BU)/RME40 (VT/WH)
RR tweeter	C4338-1	C4337-2	VME47 (BN/VT)
	C4338-2	C2364b-14	RME30 (VT/BN)
LR tweeter	C4337-1	C2364b-13	VME30 (GN/BN)
	C4338-1	C4337-2	VME47 (BN/VT)
RH subwoofer	C4212-3	C2364a-14	VME02 (VT)
	C4212-4	C2364a-15	RME02 (YE)
LH	C4212-1	C2364a-16	VME01 (GN)

Yes
GO to D9 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

subwoofer	C4212-2	C2364a-17	RME01 (GY)

- **Is the resistance less than 5 ohms between the suspect speaker and the THX® amplifier, and greater than 10,000 ohms between the suspect speaker and ground?**

D9 ISOLATE THE SUSPECT SPEAKER	
• Key in OFF position. • Connect: THX® Amplifier C2364a and C2364b. • Substitute a known good speaker for the suspect speaker. • Operate the audio unit in radio tuner mode. • **Is the concern still present?**	**Yes** GO to D11 . **No** INSTALL a new speaker for the suspect speaker. REFER to Section 415-03 . CLEAR the DTCs. REPEAT the self-test.
D10 CHECK FOR CORRECT AUDIO UNIT OPERATION	

• Key in OFF position.
• Disconnect all the audio unit connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the audio unit connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

D11 CHECK FOR CORRECT THX® AMPLIFIER OPERATION	

• Key in OFF position.
• Disconnect all the THX® amplifier connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the THX® amplifier connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new THX® amplifier. REFER to Section 415-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: No Sound From All Speakers — THX® Audio System

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The audio unit enables the THX® amplifier through circuit CME31 (BU/GN). The THX® amplifier receives voltage through circuits SBP38 (BN/RD) and SBP40 (VT/RD), and ground through circuit GD114 (BK/BU).

The enable/clip circuit CME31 (BU/GN) carries out 2 functions: to turn the THX® amplifier on, and to monitor an overload condition to the THX® amplifier. In the event of an overload, the audio unit clips the audio output signal to the THX® amplifier (heard as distortion).

Possible Causes

- Fuse
- Circuit CME31 (BU/GN) open or short to ground
- Circuit GD114 (BK/BU) open
- Circuit SBP38 (BN/RD) open
- Circuit SBP40 (VT/RD) open
- THX® amplifier
- Audio unit

PINPOINT TEST E: NO SOUND FROM ALL SPEAKERS — THX® AUDIO SYSTEM

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

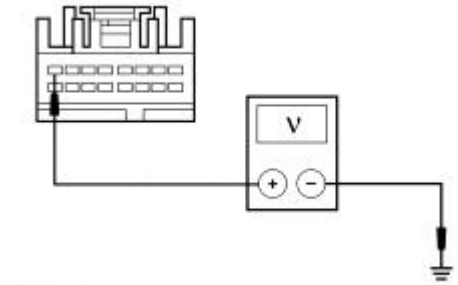
- **Are the resistances less than 5 ohms?**

question. CLEAR the DTCs. REPEAT the self-test.

E3 CHECK CIRCUIT CME31 (BU/GN) FOR VOLTAGE

- Connect: THX® Amplifier C2364a.
- Disconnect: THX® Amplifier C2364c.
- Operate the audio unit in radio tuner mode.
- Measure the voltage between the THX® amplifier C2364c-8, circuit CME31 (BU/GN), harness side and ground.



N0056311

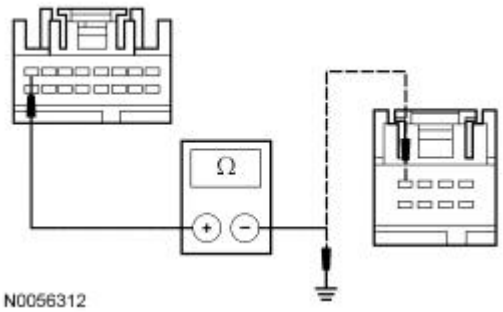
- **Is the voltage between 3.8 and 6.7 volts?**

Yes
GO to E5 .

No
GO to E4 .

E4 CHECK CIRCUIT CME31 (BU/GN) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Disconnect: Audio Unit C240c.
- Measure the resistance between the THX® amplifier C2364c-8, circuit CME27 (YE/VT), harness side and the audio unit C240c-4, circuit CME27 (YE/VT), harness side; and between the THX® amplifier C2364c-8, circuit CME27 (YE/VT), harness side and ground.



N0056312

- **Is the resistance less than 5 ohms between the THX® amplifier and the audio unit, and greater than 10,000 ohms between the THX® amplifier and ground?**

Yes
SEND the audio unit to an authorized audio system repair facility. TEST the system for normal operation after the repair.

No
REPAIR the circuit. TEST the system for normal operation.

E5 CHECK FOR CORRECT THX® AMPLIFIER OPERATION

- Key in OFF position.
- Disconnect all the THX® amplifier connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the THX® amplifier connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new THX® amplifier. REFER to Section 415-01 . REPEAT the audio unit self-test. CLEAR the audio unit DTCs.

No
The system is operating

	correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: The Subwoofer is Inoperative/Does Not Operate Correctly — Except THX®

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The subwoofer speaker and amplifier are integral. The enable/clip circuit SME23 (VT/RD) carries out 2 functions: to turn the subwoofer on, and to monitor an overload condition to the subwoofer. In the event of an overload, the audio unit clips the audio output signal to the subwoofer (heard as distortion). The subwoofer receives voltage through circuit SBP38 (BN/RD), and ground through circuit GD114 (BK/BU).

DTC B1154 — sets when a short to ground is detected on circuit RME22 (GN/WH) or VME22 (VT/GN). This DTC only sets during the on-demand self-test.

DTC B1155 — sets when a short to voltage is detected on circuit RME22 (GN/WH) or VME22 (VT/GN). This DTC only sets during the on-demand self-test.

DTC B2913 — sets when the audio unit does not detect the subwoofer through circuit SME23 (VT/RD) during the subwoofer connection test (part of the audio unit self-test).

Possible Causes

- Fuse
- Circuit GD114 (BK/BU) open
- Circuit RME22 (GN/WH) open, short to ground or voltage
- Circuit SBP38 (BN/RD) open
- Circuit SME23 (VT/RD) open, short to ground or voltage
- Circuit VME22 (VT/GN) open, short to ground or voltage
- Subwoofer
- Audio unit

PINPOINT TEST F: THE SUBWOOFER IS INOPERATIVE/DOES NOT OPERATE CORRECTLY — EXCEPT THX®

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
F1 REVIEW THE AUDIO UNIT DTCs	
• Review the DTCs from the audio unit on-demand self-test. • **Are any DTCs present?**	**Yes** If DTC B1154 or B1155 is present, GO to F7 . If DTC B2913 is present, GO to F2 . For all other DTCs,

	REFER to the Audio Unit Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to F2 .
F2 CHECK CIRCUIT SBP38 (BN/RD) FOR VOLTAGE • Key in OFF position. • Disconnect: Subwoofer C466. • Measure the voltage between the subwoofer C466-5, circuit SBP38 (BN/RD), harness side and ground.  A0021366 • **Is the voltage greater than 10 volts?**	**Yes** GO to F3 . **No** VERIFY the smart junction box (SJB) fuse 38 (20A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.
F3 CHECK CIRCUIT GD114 (BK/BU) FOR AN OPEN • Measure the resistance between the subwoofer C466-2, circuit GD114 (BK/BU), harness side and ground.  GK5794-A • **Is the resistance less than 5 ohms?**	**Yes** GO to F4 . **No** REPAIR the circuit. TEST the system for normal operation.
F4 CHECK CIRCUIT SME23 (VT/RD) FOR VOLTAGE • Operate the audio unit in radio tuner mode. • Measure the voltage between the subwoofer C466-1, circuit SME23 (VT/RD), harness side and ground.  GK4985-A • **Is the voltage between 3.8 and 6.7 volts?**	**Yes** If DTC B2913 was present during the self-test, INSTALL a new subwoofer. REFER to Section 415-03 . TEST the system for normal operation. Otherwise, GO to F7 . **No** GO to F5 .
F5 CHECK CIRCUIT SME23 (VT/RD) FOR A SHORT TO VOLTAGE • Key in OFF position. • Disconnect: Audio Unit C240c.	**Yes** GO to F6 .

• Key in ON position. • Measure the voltage between the subwoofer C466-1, circuit SME23 (VT/RD), harness side and ground.  GK4985-A • **Is any voltage present?**	**No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
F6 CHECK CIRCUIT SME23 (VT/RD) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the subwoofer C466-1, circuit SME23 (VT/RD), harness side and the audio unit C240c-4, circuit SME23 (VT/RD), harness side; and between the subwoofer C466-1, circuit SME23 (VT/RD), harness side and ground.  A0072794 • **Is the resistance less than 5 ohms between the subwoofer and the audio unit, and greater than 10,000 ohms between the subwoofer and ground?**	**Yes** GO to F10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
F7 CHECK THE AUDIO SIGNAL TO THE SUBWOOFER	
• Key in OFF position. • Disconnect: Subwoofer C466. • Operate the audio unit in radio tuner mode. • Measure the AC voltage between the subwoofer C466-7, circuit VME22 (VT/GN), harness side and the subwoofer C466-8, circuit RME22 (GN/WH), harness side.  A0057176 • **Is a fluctuating AC voltage present?**	**Yes** INSTALL a new subwoofer. REFER to Section 415-03 . CLEAR the DTCs. REPEAT the self-test. **No** GO to F8 .
F8 CHECK THE AUDIO CIRCUITS FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Audio Unit C240c.	**Yes** REPAIR the circuit in

• Key in ON position. • Measure the voltage between the subwoofer C466-7, circuit VME22 (VT/GN), harness side and ground; or between the subwoofer C466-8, circuit RME22 (GN/WH), harness side and ground.  N0035293 • **Is any voltage present?**	question. CLEAR the DTCs. REPEAT the self-test. **No** GO to F9 .
F9 CHECK THE AUDIO CIRCUITS FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the subwoofer, harness side and the audio unit, harness side; and between the subwoofer, harness side and ground as follows: **Subwoofer Connector-Pin** / **Audio Unit Connector-Pin** / **Circuit** C466-7 / C240c-1 / VME22 (VT/GN) C466-8 / C240c-2 / RME22 (GN/WH) • **Is the resistance less than 5 ohms between the subwoofer and the audio unit, and greater than 10,000 ohms between the subwoofer and ground?**	**Yes** GO to F10 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
F10 CHECK FOR CORRECT AUDIO UNIT OPERATION	

• Key in OFF position.
• Disconnect all the audio unit connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the audio unit connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: The Video System Does Not Operate Correctly — No Audio

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The digital versatile disc (DVD) player routes audio signals to the audio unit. In single-play mode, the audio unit plays the DVD audio on all speakers. In dual-play mode, the DVD player controls the rear speakers (except THX®) and the headphones.

Possible Causes

- Circuit RME17 (GY) open, short to ground or voltage
- Circuit RME18 (YE) open, short to ground or voltage
- Circuit VME17 (GN) open, short to ground or voltage
- Circuit VME18 (VT) open, short to ground or voltage
- DVD player
- Audio unit

PINPOINT TEST G: THE VIDEO SYSTEM DOES NOT OPERATE CORRECTLY — NO AUDIO

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Before diagnosing the DVD player, make sure a known good DVD is installed.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>G1 CHECK THE OPERATION OF THE DVD VIDEO
• Operate the DVD player in single-play mode.
• Does the DVD video operate correctly?</td><td>Yes
GO to G2 .

No
GO to Symptom Chart .</td></tr>
<tr><td>G2 CHECK THE AUDIO CIRCUITS TO THE AUDIO UNIT FOR A SHORT TO VOLTAGE
• Key in OFF position.
• Disconnect: Audio Unit C240b.
• Disconnect: DVD Player C949.
• Key in ON position.
• Measure the voltage between the audio unit, harness side and ground as follows:

The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.</td></tr>
</table>

Pinpoint Test H: No Auxiliary Headphone Audio — THX®

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

Audio signals are sent from the audio unit to the auxiliary audio module or the digital versatile disc (DVD) player. In single-play mode, the audio unit controls the output to all speakers and the headphones. In dual-play mode, the auxiliary audio module (or DVD player) controls the headphones.

Possible Causes

- Circuit RME09 (BN/YE) open, short to ground or voltage
- Circuit RME12 (BN/BU) open, short to ground or voltage
- Circuit VME09 (BN/GN) open, short to ground or voltage
- Circuit VME12 (BN/WH) open, short to ground or voltage

- Headphones
- Auxiliary audio module
- DVD player

PINPOINT TEST H: NO AUXILIARY HEADPHONE AUDIO — THX®

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Before diagnosing this condition, be sure the headphone batteries are OK.

GO to H5 .

No
REPAIR the circuit in question. TEST the system for normal operation.

H5 ISOLATE THE HEADPHONES

- Connect: Audio Unit C240a.
- Connect: Auxiliary Audio Module C3077 or DVD Player C949.
- Install a set of known good headphones.
- Operate the audio unit in radio tuner mode and listen through the headphones.
- **Do the headphones operate correctly?**

Yes
SEND the DVD player to an authorized audio system repair facility. TEST the system for normal operation after the repair.

No
GO to H6 .

H6 CHECK FOR CORRECT AUXILIARY AUDIO MODULE (OR DVD PLAYER) OPERATION

- Key in OFF position.
- Disconnect the auxiliary audio module (or DVD player) connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the auxiliary audio module (or DVD player) connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

Yes
If equipped with an auxiliary audio module, INSTALL a new auxiliary audio module. REFER to Section 415-01 . TEST the system for normal operation.

If equipped with a DVD player, REMOVE the DVD player and SEND it to an authorized audio system repair facility. REFER to Section 415-07 . TEST the system for normal operation after the repair.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: Loud Popping Sound When Cycling The Ignition

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

Voltage is sent through the start input circuit CBP28 (GY/VT) to the audio unit with the key in START. Upon receiving this signal, the audio unit mutes all speaker outputs to eliminate the possibility of speaker pops during engine cranking.

For the Audiophile audio system, the audio unit disables the subwoofer while the key is in START by keeping the enable signal below 0.4 volts.

For the THX® audio system, the audio unit disables the THX® amplifier while the key is in START by keeping the enable signal below 0.4 volts.

Possible Causes

- Fuse
- Circuit CBP28 (GY/VT) open
- Subwoofer (Audiophile)
- THX® amplifier
- Audio unit

PINPOINT TEST I: LOUD POPPING SOUND WHEN CYCLING THE IGNITION

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
I1 CHECK CIRCUIT CBP28 (GY/VT) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Audio Unit C240a. • Disconnect: Starter Relay. • Key in START position. • Measure the voltage between the audio unit C240a-15, circuit CBP28 (GY/VT), harness side and ground.  A0072795 • **Is the voltage greater than 10 volts?**	**Yes** For the Audiophile audio system, GO to I2 . For the THX® audio system, GO to I3 . For all others, SEND the audio unit to an authorized audio system repair facility. TEST the system for normal operation after the repair. **No** VERIFY the smart junction box (SJB) fuse 28 (5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.
I2 ISOLATE THE SUBWOOFER	
• Key in OFF position. • Connect: Audio Unit C240a. • Disconnect: Subwoofer C466. • Cycle the key through all of the ignition switch positions.	**Yes** REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system

• **Is a loud popping sound present?**	for normal operation after the repair. **No** INSTALL a new subwoofer. REFER to Section 415-03 . TEST the system for normal operation.
I3 ISOLATE THE THX® AMPLIFIER	
• Key in OFF position. • Connect: Audio Unit C240a. • Disconnect: THX® Amplifier C2364c. • Key in START position. • Measure the voltage between the THX® Amplifier C2364c-8, circuit CME31 (BU/GN), harness side and ground.  N0056311 • **Is the voltage greater than 0.4 volts?**	**Yes** REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair. **No** GO to I4 .
I4 CHECK FOR CORRECT THX® AMPLIFIER OPERATION	

• Key in OFF position.
• Disconnect all the THX® amplifier connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the THX® amplifier connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new THX® amplifier. REFER to Section 415-01 . REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test J: The Steering Wheel Controls Are Inoperative/Do Not Operate Correctly

Refer to Wiring Diagrams Cell 130 , Audio/Navigation for schematic and connector information.

Normal Operation

Voltage is sent from the audio unit to the steering wheel controls through circuit VME14 (GY/YE). When a switch is pressed, the voltage is routed through a specific resistor value for each function. The audio unit receives this reference voltage through circuit RME14 (BN/GN). The audio unit then uses this reference voltage to determine which control input function has been selected.

DTC B1117 — sets when a steering wheel control button is detected as active for greater than 120 seconds during normal operation, or for any duration during the self-test.

DTC B1136 — sets when the return voltage from the steering wheel controls is out-of-range. This can be caused by any failure on the steering wheel controls circuit.

DTC B2404 — sets when the return voltage from the steering wheel controls is out-of-range. This can be caused by any failure on the steering wheel controls circuit.

Possible Causes

- Circuit RME14 (BN/GN) open, short to ground or voltage
- Circuit VME14 (GY/YE) open, short to ground or voltage
- Clockspring
- Steering wheel controls
- Audio unit

PINPOINT TEST J: THE STEERING WHEEL CONTROLS ARE INOPERATIVE/DO NOT OPERATE CORRECTLY

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>J1 CHECK THE STEERING WHEEL CONTROLS RESISTANCE VALUES</td><td></td></tr>
<tr><td>

Key in OFF position.
Disconnect: Audio Unit C240a.
Measure the resistance between the audio unit C240a-18, circuit VME14 (GY/YE), harness side and the audio unit C240a-19, circuit RME14 (BN/GN), harness side while pressing the steering wheel controls as follows:

<table>
<tr><th>Switch</th><th>Resistance Range (Ohms)</th></tr>
<tr><td>VOL-</td><td>50.6-52.6</td></tr>
<tr><td>VOL+</td><td>118.0-121.4</td></tr>
<tr><td>SEEK+</td><td>208.0-213.1</td></tr>

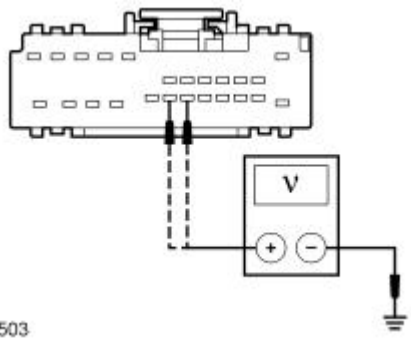
No
GO to J2 .</td></tr>
<tr><td>J2 CHECK THE CIRCUITS TO THE CLOCKSPRING FOR A SHORT TO VOLTAGE</td><td></td></tr>
<tr><td>

Disconnect: Clockspring C218a.
Key in ON position.
Measure the voltage between the audio unit C240a-18, circuit VME14 (GY/YE), harness side and ground; and between the audio unit C240a-19, circuit RME14 (BN/GN), harness side and ground.



A0073503

Is any voltage present?

</td><td>Yes
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

No
GO to J3 .</td></tr>
</table>

J3 CHECK THE CIRCUITS TO THE CLOCKSPRING FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the audio unit, harness side and the clockspring, harness side; and between the audio unit, harness side and ground as follows: **Audio Unit Connector-Pin** / **Clockspring Connector-Pin** / **Circuit** C240a-18 / C218a-13 / VME14 (GY/YE) C240a-19 / C218a-12 / RME14 (BN/GN) • **Is the resistance less than 5 ohms between the audio unit and the clockspring, and greater than 10,000 ohms between the audio unit and ground?**	**Yes** GO to J4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
J4 ISOLATE THE STEERING WHEEL CONTROLS	
• Key in OFF position. • Substitute the steering wheel controls with a known good unit. • Connect: Audio Unit C240c. • Operate the audio unit in radio tuner mode. • Press the steering wheel control switches and observe the audio unit. • **Does the audio system operate correctly?**	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL new steering wheel controls. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test.
J5 CHECK FOR CORRECT AUDIO UNIT OPERATION	

• Key in OFF position.
• Disconnect all the audio unit connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the audio unit connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test K: The Satellite Audio Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The satellite radio receiver receives voltage through circuit SBP03 (BU/RD), and ground through circuit GD114 (BK/BU). Digital signals are received by the satellite antenna and sent to the satellite radio receiver. Audio signals are sent to the auxiliary audio module or the digital versatile disc (DVD) player (if

equipped), then to the audio unit.

Possible Causes

- Circuit RME17 (GY) open, short to ground or voltage
- Circuit RME18 (YE) open, short to ground or voltage
- Circuit RME41 (BU/BN) open, short to ground or voltage
- Circuit RME42 (YE/BU) open, short to ground or voltage
- Circuit VME17 (GN) open, short to ground or voltage
- Circuit VME18 (VT) open, short to ground or voltage
- Circuit VME41 (GN/OG) open, short to ground or voltage
- Circuit VME42 (VT/BN) open, short to ground or voltage
- Satellite radio receiver
- Auxiliary audio module
- DVD player
- Audio unit

PINPOINT TEST K: THE SATELLITE AUDIO IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
K1 VERIFY THE AUDIO UNIT RECOGNIZES THE SATELLITE RADIO RECEIVER	
• Key in ON position. • For vehicles without navigation, turn the audio unit on and press the AUX button repeatedly until SAT1 is displayed. • For vehicles with navigation, turn the audio unit on and verify the presence of the SR folder tab on the touchscreen. • **Is SAT1 or the SR folder tab available?**	**Yes** GO to K2 . **No** REFER to Section 418-00 to diagnose the communication network.
K2 VERIFY AN ACTIVE SUBSCRIPTION	
• Enter satellite mode on the audio unit and observe the display. • **Does the display read CALL SIRIUS?**	**Yes** The subscription has expired. INFORM the customer to contact Sirius to re-activate the subscription. **No** GO to K3 .
K3 CHECK THE RECORDED DTCs	
• Perform the satellite audio bezel diagnostic test. • **Are any satellite audio system DTCs present?**	**Yes** If DTC B1031 SAT or DTC B1032 SAT is present, Go To Pinpoint Test I . For all other DTCs, REFER to the Satellite Radio Receiver Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to K4 .

K4 CHECK THE SATELLITE RADIO RECEIVER OPERATION

- Perform the satellite bezel diagnostic self-test.
- **Are alternating LH/RH tones audible?**

Yes
GO to K10 .

No
GO to K5 .

K5 ISOLATE THE AUXILIARY AUDIO MODULE (OR DVD PLAYER)

- Key in OFF position.
- Disconnect: Auxiliary Audio Module C3077 or DVD Player C949.
- Connect fused (10A) jumper wires between the auxiliary audio module (or DVD player) pins as follows:

Auxiliary Audio Module or DVD Player Pin-Circuit/ Circuit	Auxiliary Audio Module or DVD Player Pin-Circuit/ Circuit
C3077-21 or C949-21 VME42 (VT/BN)	C3077-26 or C949-26 VME18 (VT)
C3077-22 or C949-22 RME42 (YE/BU)	C3077-25 or C949-25 RME18 (YE)
C3077-5 or C949-5 VME41 (GN/OG)	C3077-10 or C949-10 VME17 (GN
C3077-6 or C949-6 RME41 (BU/BN)	C3077-9 or C949-9 RME17 (GY)

- Key in ON position.
- Perform the satellite bezel diagnostic self-test.
- **Are alternating LH/RH tones audible?**

Yes
REMOVE the jumper wires. GO to K12 .

No
REMOVE the jumper wires. GO to K6 .

K6 CHECK THE AUDIO CIRCUITS FROM THE SATELLITE RADIO RECEIVER FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Satellite Radio Receiver C3290.
- Key in ON position.
- Measure the voltage between the satellite radio receiver, harness side and ground as follows:

Satellite Radio Receiver Connector-Pin	Circuit
C3290-5	VME41 (GN/OG)
C3290-6	VME42 (VT/BN)
C3290-11	RME41 (BU/BN)
C3290-12	RME42 (YE/BU)

- **Is any voltage present?**

Yes
REPAIR the circuit in question. TEST the system for normal operation.

No
GO to K7 .

K7 CHECK THE AUDIO CIRCUITS FROM THE SATELLITE RADIO RECEIVER FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the satellite radio

Yes
GO to K8 .

receiver, harness side and the auxiliary audio module (or DVD player), harness side; and between the satellite radio receiver, harness side and ground as follows:

Satellite Radio Receiver Connector-Pin	Auxiliary Audio Module (or DVD Player) Connector-Pin	Circuit
C3290-5	C3077-5	VME41 (GN/OG)
C3290-6	C3077-21	VME42 (VT/BN)
C3290-11	C3077-6	RME41 (BU/BN)
C3290-12	C3077-22	RME42 (YE/BU)

- **Is the resistance less than 5 ohms between the satellite radio receiver and the auxiliary audio module (or DVD player), and greater than 10,000 ohms between the satellite radio receiver and ground?**

No
REPAIR the circuit in question.
TEST the system for normal operation.

K8 CHECK THE AUDIO CIRCUITS TO THE AUDIO UNIT FOR A SHORT TO VOLTAGE

- Disconnect: Audio Unit C240b.
- Key in ON position.
- Measure the voltage between the audio unit, harness side and ground as follows:

Audio Unit Connector-Pin	Circuit
C240b-1	VME17 (GN)
C240b-2	RME17 (GY)
C240b-9	VME18 (VT)
C240b-10	RME18 (YE)

- **Is any voltage present?**

Yes
REPAIR the circuit in question.
TEST the system for normal operation.

No
GO to K9 .

K9 CHECK THE AUDIO CIRCUITS TO THE AUDIO UNIT FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the audio unit, harness side and the auxiliary audio module (or DVD player), harness side; and between the audio unit, harness side and ground as follows:

Audio Unit Connector-Pin	Auxiliary Audio Module (or DVD Player) Connector-Pin	Circuit
C240b-1	C3077-10	VME17 (GN)
C240b-2	C3077-9	RME17 (GY)
C240b-9	C3077-26	VME18 (VT)

Yes
GO to K10 .

No
REPAIR the circuit in question.
TEST the system for normal operation.

C240b-10	C3077-25	RME18 (YE)

- **Is the resistance less than 5 ohms between the audio unit and the auxiliary audio module (or DVD player), and greater than 10,000 ohms between the audio unit and ground?**

K10 ISOLATE THE SATELLITE RADIO RECEIVER	
• Key in OFF position. • Connect: Auxiliary Audio Module C3077 or DVD Player C949. • Substitute a known good satellite radio receiver. • Operate the audio unit in satellite audio mode. • **Does the system operate correctly?**	**Yes** SEND the original satellite radio receiver to an authorized audio system repair facility. TEST the system for normal operation. **No** INSTALL the original satellite radio receiver. GO to K11 .
K11 CHECK FOR CORRECT AUDIO UNIT OPERATION	

• Key in OFF position.
• Disconnect all the audio unit connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the audio unit connectors and make sure they seat correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

K12 CHECK FOR CORRECT AUXILIARY AUDIO MODULE (OR DVD PLAYER) OPERATION	

• Key in OFF position.
• Disconnect the auxiliary audio module (or DVD player) connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the auxiliary audio module (or DVD player) connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	If equipped with an auxiliary audio module, INSTALL a new auxiliary audio module. REFER to Section 415-01 . TEST the system for normal operation.
	
	If equipped with a DVD player, REMOVE the DVD player and SEND it to an authorized audio system repair facility. REFER to Section 415-07 . TEST the system for normal operation after the repair.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test L: Poor Reception — Satellite Audio

Normal Operation

Digital signals are received by the satellite antenna and sent to the satellite radio receiver, which then converts the signals and provides audio signals to the auxiliary audio module, or to the digital versatile disc (DVD) player, if equipped.

DTC B1031 — sets when an open or high resistance is detected in the satellite antenna circuit.

DTC B1032 — sets when a short to ground is detected in the satellite antenna circuit.

Possible Causes

- Satellite antenna cable
- Satellite antenna
- Satellite radio receiver

PINPOINT TEST L: POOR RECEPTION — SATELLITE AUDIO

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
L1 REVIEW THE DTCs	
• Review the DTCs from the satellite radio receiver self-test. • **Is DTC B1031 or B1032 present?**	**Yes** GO to L3 . **No** GO to L2 .
L2 CHECK THE OPERATION OF THE SATELLITE AUDIO	
• Drive the vehicle to an open location, free of obstacles. • Operate the audio unit in satellite audio mode. • **Is the reception OK?**	**Yes** The system is OK at this time. ADVISE the customer that the satellite signal can be affected by obstructions to the satellite antenna line of sight. **No** GO to L3 .
L3 CHECK THE SATELLITE ANTENNA CABLE	
• Key in OFF position. • Disconnect: Satellite Antenna Connection (at satellite radio receiver). • Disconnect: Satellite Antenna Connection (at satellite antenna). • Measure the resistance of the satellite radio antenna cable between the satellite radio receiver and the satellite antenna connection. • **Is the resistance less than 1 ohm?**	**Yes** GO to L4 . **No** INSTALL a new satellite antenna cable. CLEAR the DTCs. REPEAT the self-test.
L4 SUBSTITUTE THE SATELLITE ANTENNA	
• Install a known good satellite antenna. • Operate the audio unit in satellite audio mode. • **Is the reception OK?**	**Yes** INSTALL a new satellite antenna. REFER to Section 415-02 . CLEAR the DTCs. REPEAT the self-test.

	No REMOVE the satellite radio receiver and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.

Pinpoint Test M: The Audio Input Jack Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

Audio signals are sent from the audio input jack to the audio unit. There are no external power or ground circuits to the audio input jack.

Possible Causes

- Circuit RME45 (YE/GN) open, short to ground or voltage
- Circuit RME46 (WH/GN) open, short to ground or voltage
- Circuit VME45 (BU) open, short to ground or voltage
- Circuit VME46 (BU/GN) open, short to ground or voltage
- Audio input jack
- Audio unit

PINPOINT TEST M: THE AUDIO INPUT JACK IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Before performing this pinpoint test, be sure the MP3 device is operating correctly.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>M1 CHECK THE AUDIO INPUT JACK CIRCUITS FOR A SHORT TO VOLTAGE</td><td></td></tr>
<tr><td>

Key in OFF position.
Disconnect: Audio Input Jack C2362.

No
GO to M2 .</td></tr>
<tr><td>M2 CHECK THE AUDIO INPUT JACK CIRCUITS FOR AN OPEN OR SHORT TO GROUND</td><td></td></tr>
</table>

<table>
<tr>
<td>

Key in OFF position.
Measure the resistance between the audio input jack, harness side and the audio unit, harness side; and between the audio input jack, harness side and ground as follows:

<table>
<tr><th>Audio Input Jack Connector-Pin</th><th>Audio Unit Connector-Pin</th><th>Circuit</th></tr>
<tr><td>C2362-1</td><td>C240b-6</td><td>VME46 (BU/GN)</td></tr>
<tr><td>C2362-2</td><td>C240b-14</td><td>RME46 (WH/GN)</td></tr>
<tr><td>C2362-3</td><td>C240b-8</td><td>RME45 (YE/GN)</td></tr>
<tr><td>C2362-4</td><td>C240b-7</td><td>VME45 (BU)</td></tr>
</table>

Is the resistance less than 5 ohms between the audio input jack and the audio unit, and greater than 10,000 ohms between the audio input jack and ground?

</td>
<td>Yes
GO to M3 .

No
REPAIR the circuit in question. TEST the system for normal operation.</td>
</tr>
<tr><td>M3 SUBSTITUTE THE AUDIO INPUT JACK</td><td rowspan="2"></td></tr>
<tr>
<td>

Install a known good audio input jack.
Operate the audio unit in auxiliary audio mode.
Does the system operate correctly?

</td>
<td>Yes
INSTALL a new audio input jack. REFER to Section 415-01 . TEST the system for normal operation.

No
INSTALL the original audio input jack. REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.</td>
</tr>
</table>

Pinpoint Test N: Voice Recognition Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

When the VOICE switch is pressed, a signal is sent to the audio unit through VMN16 (BN/WH), and the audio unit enters voice recognition mode. A microphone located in the interior rear view mirror receives the voice command and sends a signal to the audio unit through circuits RMN07 (VT) and VMN07 (GY). Power to the interior rear view mirror is provided through circuit CBP31 (BU/OG), and ground through circuit GD133 (BK).

DTC B2633 — sets when an open, short to ground, or short to voltage is detected on the microphone circuits.

Possible Causes

- Fuse
- Circuit CBP31 (BU/OG) open, short to ground or voltage
- Circuit GD133 (BK) open, short to ground or voltage
- Circuit RMN07 (VT) open, short to ground or voltage

- Circuit VMN07 (GY) open, short to ground or voltage
- Circuit VMN16 (BN/WH) open, short to ground or voltage
- Steering wheel controls
- Microphone (part of the interior rear view mirror)
- Audio unit

PINPOINT TEST N: VOICE RECOGNITION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>N1 CHECK THE DTCs</td><td></td></tr>
<tr><td>• Review the DTCs from the audio unit self-test.
• Is DTC B2633 retrieved?</td><td>Yes
GO to N9 .

No
GO to N2 .</td></tr>
<tr><td>N2 CHECK THE OPERATION OF THE STEERING WHEEL CONTROL SWITCHES</td><td></td></tr>
<tr><td>• Operate the audio unit in radio tuner mode.
• Press the VOL+ and VOL- steering wheel control switches.
• Do the VOL+ and VOL- steering wheel control switches operate correctly?</td><td>Yes
GO to N3 .

No
Go To Pinpoint Test J .</td></tr>
<tr><td>N3 CHECK THE OPERATION OF THE VOICE RECOGNITION ICON</td><td></td></tr>
<tr><td>• Press the VOICE switch and observe the operation of the voice recognition icon on the audio unit.
• Does the voice recognition icon toggle with the VOICE switch?</td><td>Yes
GO to N9 .

No
GO to N4 .</td></tr>
<tr><td>N4 CHECK THE VOICE SWITCH</td><td></td></tr>
<tr><td>• Key in OFF position.
• Disconnect: Steering Wheel Controls C2367 (Expedition, Expedition EL) or C2999 (Navigator).
• Measure the resistance between the steering wheel controls pins component side while pressing and releasing the VOICE switch as follows:
<table>
<tr><th>Vehicle</th><th>Steering Wheel Controls Connector-Pin</th><th>Steering Wheel Controls Connector-Pin</th><th>VOICE Switch Position</th><th>Resistance Value (Ohms)</th></tr>
<tr><td>Expedition, Expedition EL</td><td>C2367-7</td><td>C2367-8</td><td>Pressed
Released</td><td>50.6-51.6
1,050.4-1,071.6</td></tr>
<tr><td>Navigator</td><td>C2999-4</td><td>C2999-6</td><td>Pressed
Released</td><td>50.6-51.6
179.3-182.9</td></tr>
</table>
• Are all the resistance values within specification?</td><td>Yes
GO to N5 .

No
INSTALL new steering wheel controls. REFER to Section 415-01 . TEST the system for normal operation.</td></tr>
</table>

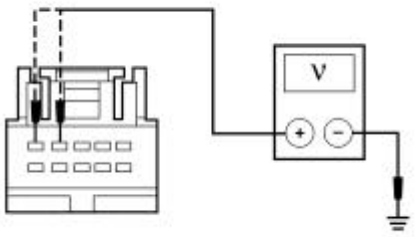
N5 CHECK CIRCUIT VMN16 (BN/WH) FOR A SHORT TO VOLTAGE	
• Disconnect: Audio Unit C240a. • Key in ON position. • Measure the voltage between the audio unit C240a-17, circuit VMN16 (BN/WH), harness side and ground.  N0057249 • **Is any voltage present?**	**Yes** GO to N6 . **No** GO to N7 .
N6 CHECK THE CLOCKSPRING FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Clockspring C218a. • Key in ON position. • Measure the voltage between the audio unit C240a-17, circuit VMN16 (BN/WH), harness side and ground.  N0057249 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation.
N7 CHECK CIRCUIT VMN16 (BN/WH) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the audio unit, harness side and the steering wheel controls, harness side; and between the audio unit, harness side and ground as follows.	**Yes** GO to N14 . **No** GO to N8 .

Vehicle	Audio Unit Connector-Pin	Steering Wheel Controls Connector- Pin	Circuit
Expedition, Expedition EL	C240a-17	C2367-8	VMN16 (BN/WH)
Navigator	C240a-17	C2999-6	VMN16 (BN/WH)

• **Is the resistance less than 5 ohms between the audio unit and the steering wheel controls, and greater than 10,000 ohms between the audio unit and ground?**	
N8 CHECK THE CLOCKSPRING FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Clockspring C218a.	**Yes** INSTALL a new

• Measure the resistance between the audio unit C240a-17, circuit VMN16 (BN/WH), harness side and the clockspring C218a-6, circuit VMN16 (BN/WH), harness side; and between the audio unit C240a-17, circuit VMN16 (BN/WH), harness side and ground.  N0057330 • **Is the resistance less than 5 ohms between the audio unit and the clockspring, and greater than 10,000 ohms between the audio unit and ground?**	clockspring. REFER to Section 501-20B . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
N9 CHECK CIRCUIT CBP31 (BU/OG) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Interior Rear View Mirror C9012. • Key in ON position. • Measure the voltage between the interior rear view mirror C9012-1, circuit CBP31 (BU/OG), harness side and ground.  N0057331 • **Is the voltage greater than 10 volts?**	**Yes** GO to N10 . **No** VERIFY the smart junction box (SJB) fuse 31 (10A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
N10 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the interior rear view mirror C9012-10, circuit GD133 (BK), harness side and ground.  N0057336 • **Is the resistance less than 5 ohms?**	**Yes** GO to N11 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
N11 CHECK THE MICROPHONE CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: Audio Unit C240b. • Key in ON position. • Measure the voltage between the interior rear view mirror C9012-4, circuit VMN07 (GY), harness side and ground; and between the interior rear view mirror C9012-5, circuit RMN07 (VT), harness side and	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-

ground.



N0057337

- **Is any voltage present?**

test.

No
GO to N12 .

N12 CHECK THE MICROPHONE CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the inside rear view mirror, harness side and the audio unit, harness side; and between the rear view mirror, harness side and ground as follows:

Interior Rear View Mirror Connector-Pin	Audio Unit Connector-Pin	Circuit
C9012-4	C240b-11	VMN07 (GY)
C9012-5	C240b-12	RMN07 (VT)

- **Is the resistance less than 5 ohms between the interior rear view mirror and the audio unit, and greater than 10,000 ohms between the interior rear view mirror and ground?**

Yes
GO to N13 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

N13 ISOLATE THE INTERIOR REAR VIEW MIRROR

- Substitute a known good interior rear view mirror.
- Operate the audio unit in navigation mode.
- Attempt several voice commands. For additional information, refer to the Owner's Literature.
- **Does the voice recognition operate correctly?**

Yes
INSTALL a new interior rear view mirror. REFER to Section 501-09 . CLEAR the DTCs. REPEAT the self-test.

No
GO to N14 .

N14 CHECK FOR CORRECT AUDIO UNIT OPERATION

- Disconnect all the audio unit connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the audio unit connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.

No
The system is

	operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Audio System

Printable View (63 KB)

The following audio systems are available:

- Base
  - AM/FM/single compact disc (CD)/MP3
  - Six speakers
- Premium
  - AM/FM 6-CD in-dash CD changer with MP3
  - Six speakers
- Audiophile
  - AM/FM 6-CD in-dash CD changer with MP3
  - Nine speakers (includes subwoofers)
- THX®
  - AM/FM 6-CD in-dash CD changer with MP3
  - Fourteen speakers (includes subwoofer and center imaging speakers)
  - THX® amplifier (with digital signal processing capabilities)
- Navigation
  - AM/FM/6 disc in-dash CD changer with MP3
  - Touch-screen navigation integral to audio unit
  - Voice-activation
  - Available with Audiophile or THX®

In addition, the following options are available:

- Rear seat controls (part of the auxiliary audio module)
  - Not available on vehicles with bench seat
  - Wired headphones
  - Audio ports
  - Allows single/dual-play
- Digital versatile disc (DVD) player
  - Not available on vehicles with bench seat
  - Wireless headphones
  - A/V ports for connecting a gaming system
  - Allows single/dual-play
- Satellite audio
  - Available as an option with all audio units
  - Provides satellite-broadcast reception

All vehicles have an audio input jack, which can be used to connect a portable MP3 device to the vehicle. When connected, the audio files from the MP3 player can be broadcast through the vehicle speakers.

Audio System

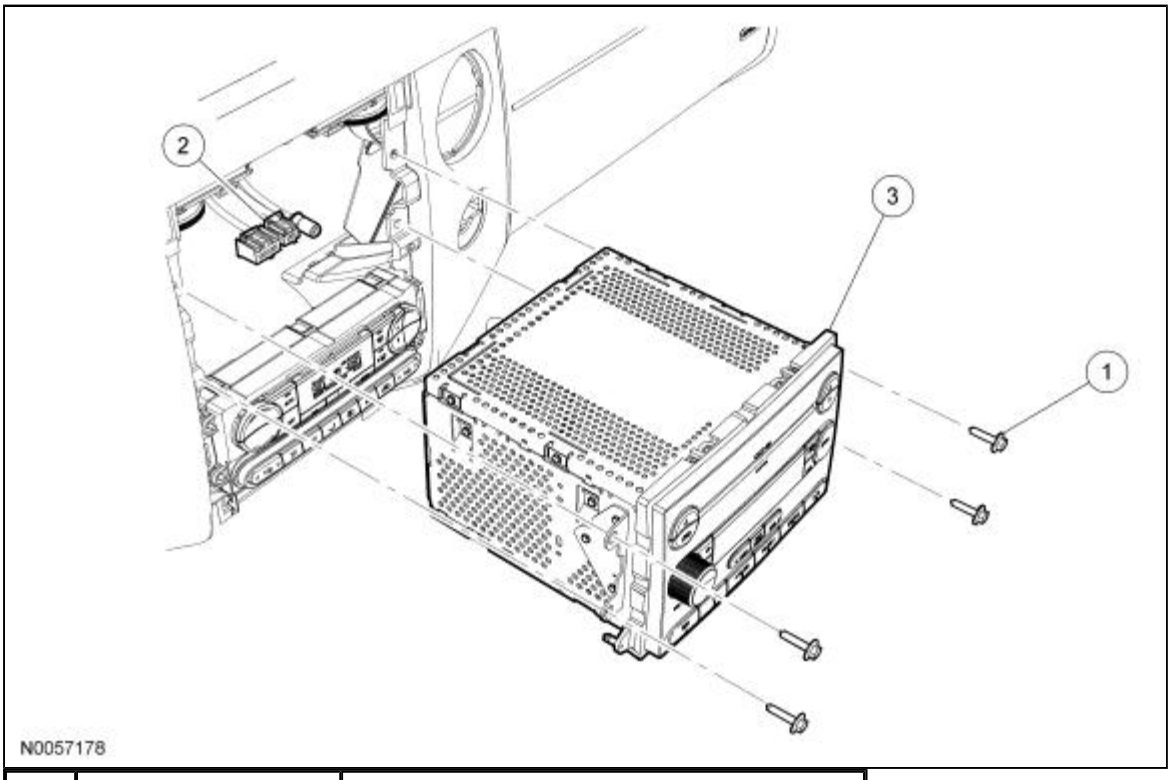
Refer to Section 415-00 .

Audio Unit

Printable View (183 KB)

NOTE: Expedition shown, Navigator similar.



Item	Part Number	Description
1	W707628-S	Audio unit screws (4 required)
2	—	Audio unit electrical connectors and antenna cable connector (part of 14401)
3	18C815/18C869/ 18K931	Audio unit

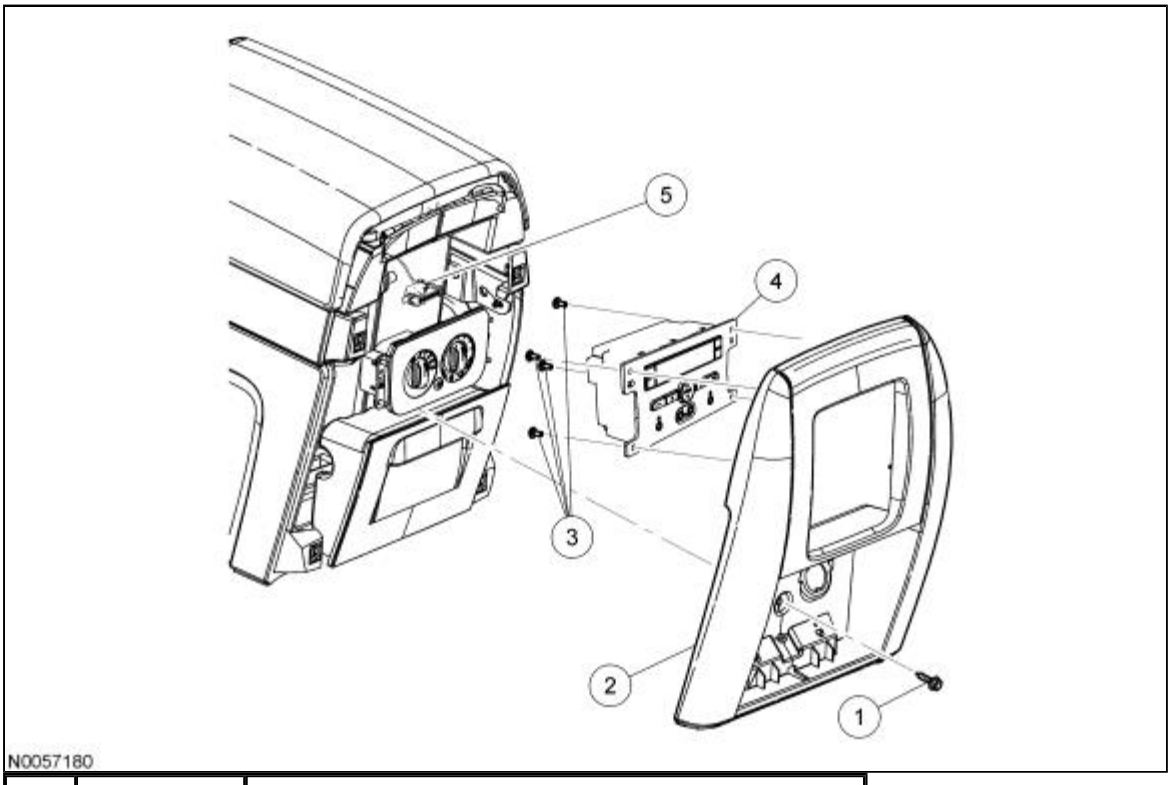
Removal and Installation

1. Remove the instrument cluster finish panel. For additional information, refer to Section 501-12 .
2. Remove the 4 screws and the audio unit.
   - Disconnect the electrical connectors, the antenna cable connector, and the global positioning system (GPS) antenna (if present).
3. To install, reverse the removal procedure.

Auxiliary Audio Module

Printable View (171 KB)

NOTE: Expedition shown, Navigator similar.



Item	Part Number	Description
1	—	Center console rear trim panel bolt
2	78045A12	Center console rear trim panel
3	W506821-S	Auxiliary audio module screws (4 required)
4	19A164	Auxiliary audio module
5	—	Auxiliary audio module electrical connector (part of 14B079)

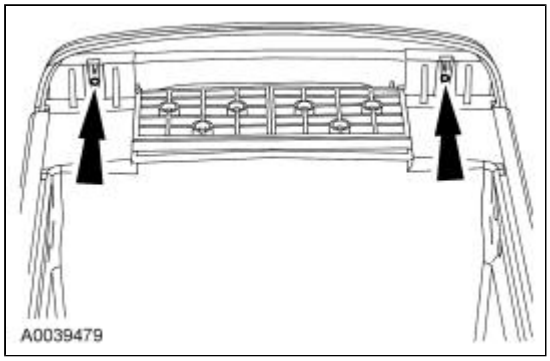
Removal and Installation

Navigator

1. Remove the floor console cupholders.
2. Remove the 2 screws securing the rear trim panel to the floor console.

Expedition

3. Remove the 2 screws under the armrest cover.



All vehicles

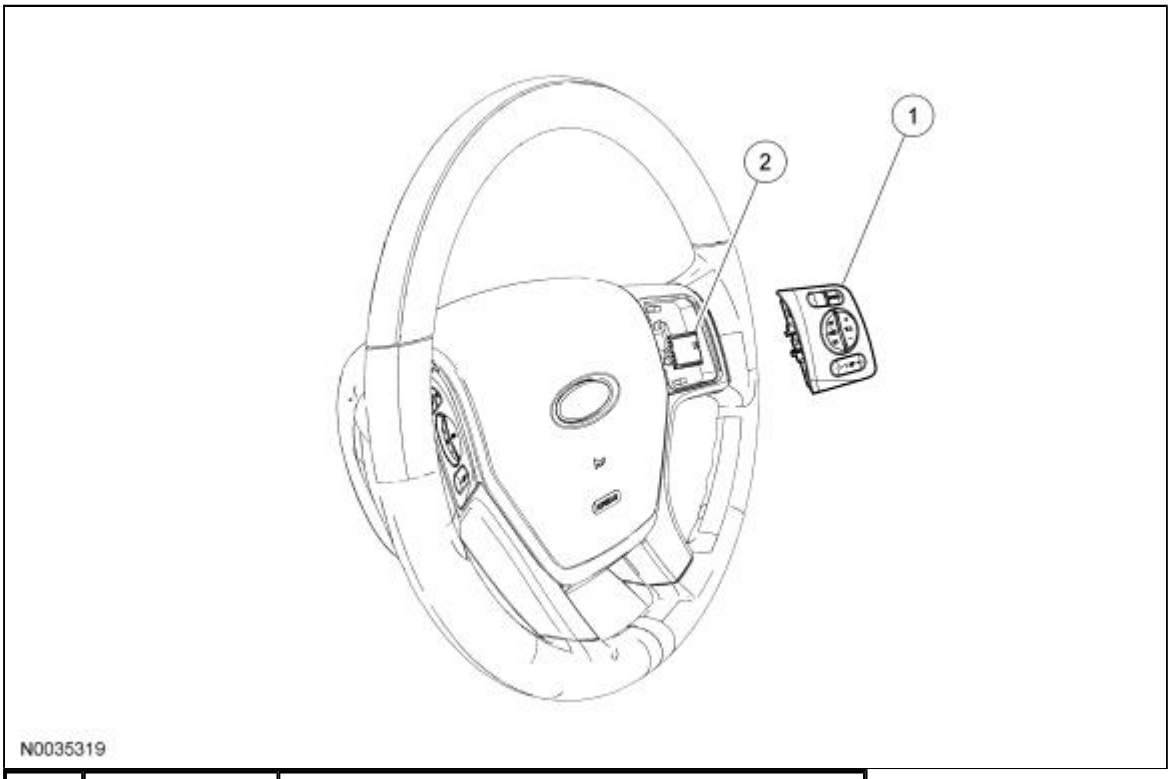
4. Remove the bolt and the center console rear trim panel.
    - Disengage the pin-type retainers.
    - Disconnect the auxiliary audio module electrical connector.

5. Remove the auxiliary audio module.
    - Remove the 4 screws.

6. To install, reverse the removal procedure.

Steering Wheel Controls — Expedition

Printable View (131 KB)



Item	Part Number	Description
1	9C888	Steering wheel controls
2	3600	Steering wheel controls electrical connector

Removal and Installation

1. **NOTE:** It is not necessary to remove the driver air bag module during this procedure.

   NOTE: When removing the steering wheel controls, disengage the RH side of the controls first.

   Using an appropriate tool, pry the steering wheel controls out of the steering wheel.

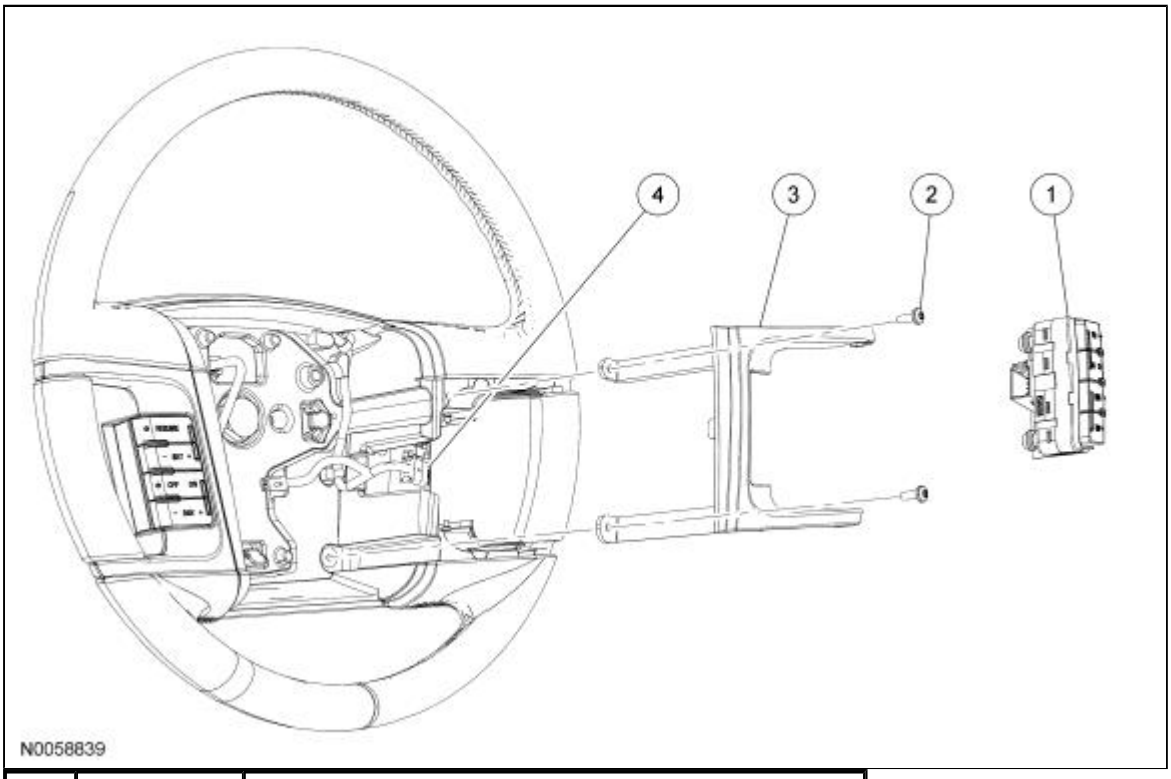
2. **NOTE:** Do not allow the electrical connector to fall back into the steering wheel.

   Remove the steering wheel controls.
   - Disconnect the electrical connector.

3. To install, reverse the removal procedure.

Steering Wheel Controls — Navigator

Printable View (160 KB)



Item	Part Number	Description
1	9C888	Steering wheel controls
2	—	Steering wheel controls screws (part of 3600) (2 required)
3	—	Steering wheel controls bezel (part of 3600)
4	—	Steering wheel controls electrical connector (part of 3600)

Removal and Installation

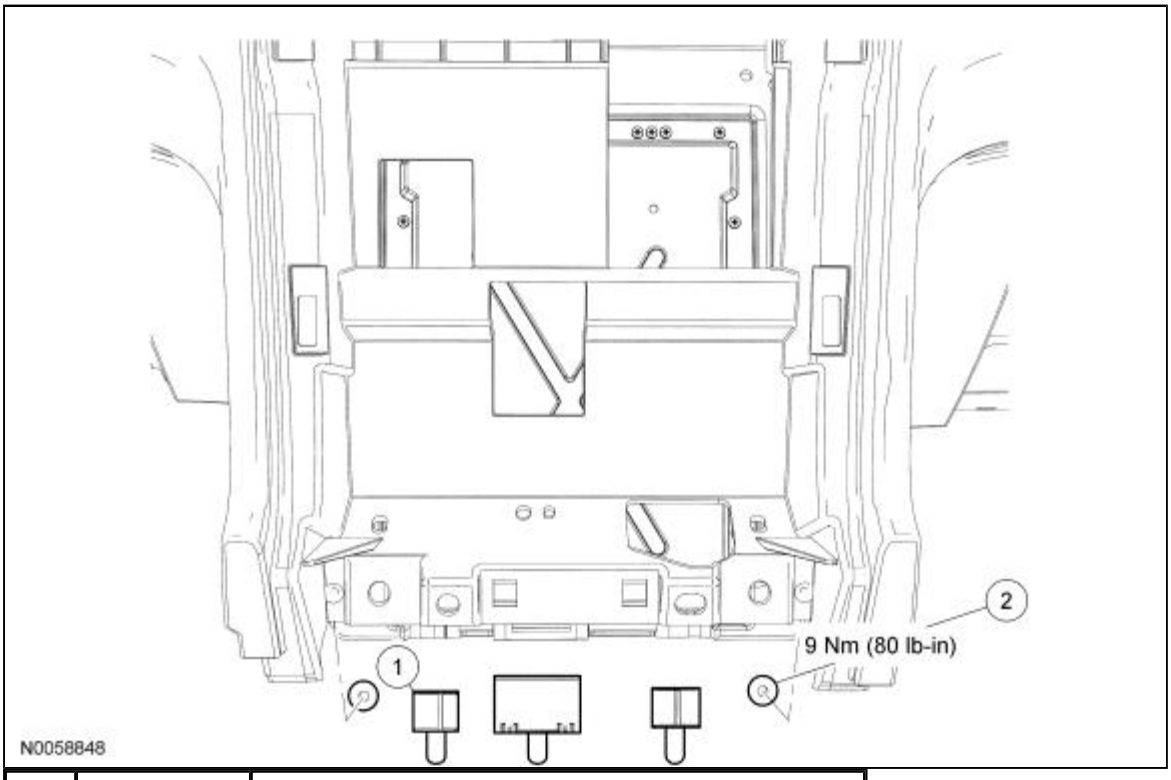
1. Remove the driver air bag module. For additional information, refer to Section 501-20B .
2. Remove the 2 screws and the steering wheel controls bezel.
3. **NOTE:** Using an appropriate tool, pry the switch from behind.

   Remove the steering wheel controls.
   - Disconnect the electrical connector.
4. To install, reverse the removal procedure.

Audio Amplifier — THX®

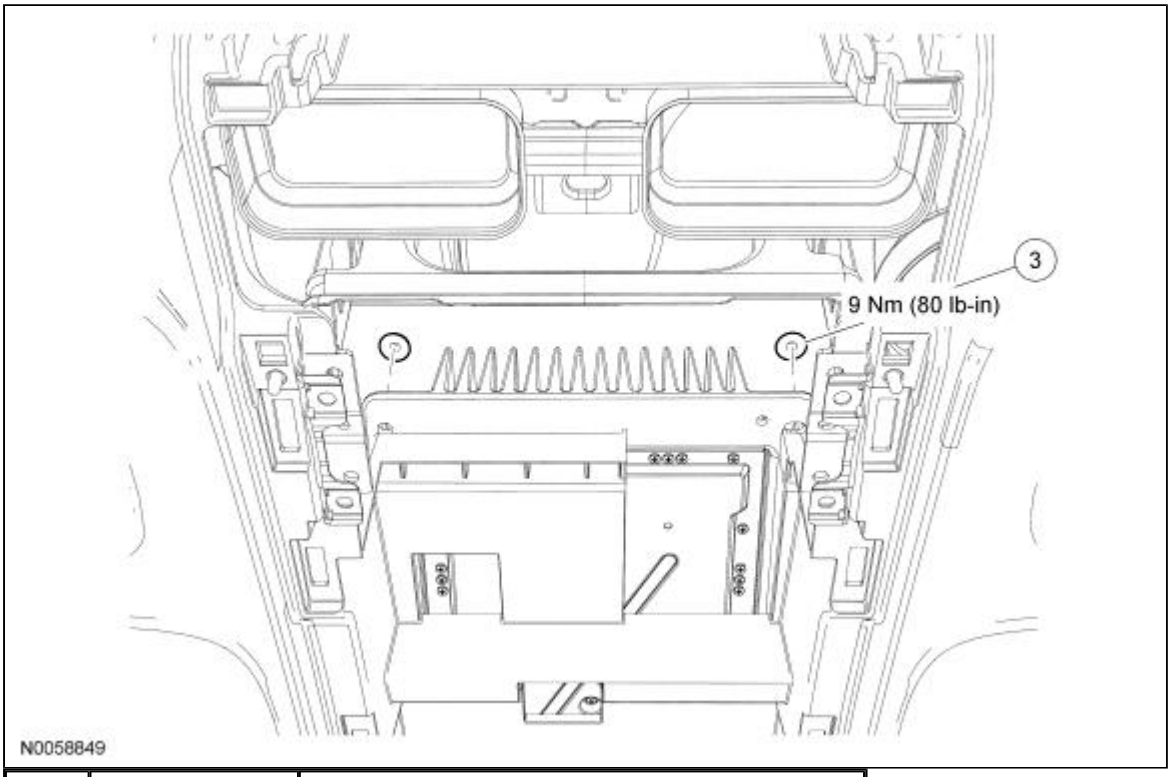
Printable View (366 KB)

THX® Amplifier Lower Attachment



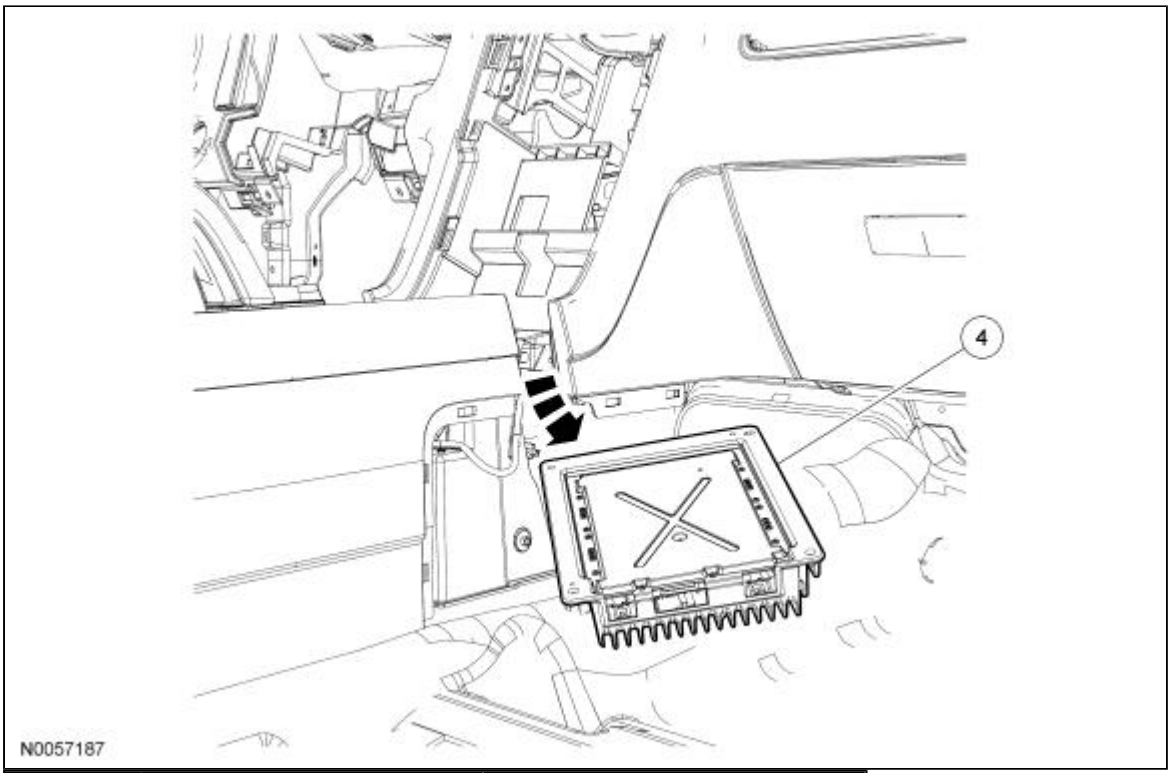
Item	Part Number	Description
1	—	THX® amplifier electrical connectors (part of 14401)
2	W701152-S	THX® amplifier lower nuts (2 required)

THX® Amplifier Upper Attachment



Item	Part Number	Description
3	W701152-S	THX® amplifier upper nuts (2 required)

THX® Amplifier Removal Routing



Item	Part Number	Description
4	18B849	THX® amplifier

Removal and Installation

1. Remove the audio unit. For additional information, refer to Audio Unit in this section.

2. Remove the necessary attachments and move the center console 5 cm (2.0 in) towards the rear of the vehicle. For additional information, refer to Section 501-12 .

3. Disconnect the THX® amplifier electrical connectors.

4. Remove the 2 lower THX® amplifier nuts.
   - To install, tighten to 9 Nm (80 lb-in).

5. **CAUTION: The THX® amplifier is heavy. Be sure to support the amplifier during removal, or damage to the vehicle may occur.**

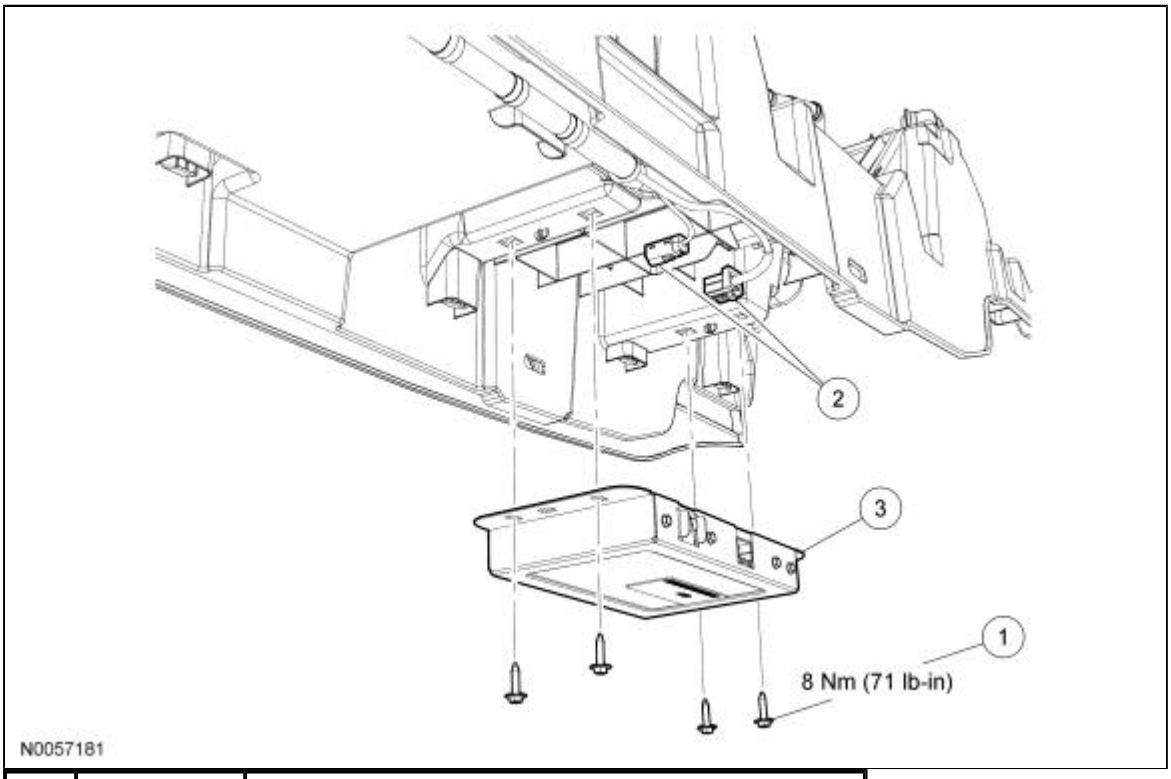
   Remove the 2 upper THX® amplifier nuts.
   - To install, tighten to 9 Nm (80 lb-in).

6. Remove the THX® amplifier.
   - Route the THX® amplifier down and towards the passenger side of the vehicle.

7. To install, reverse the removal procedure.

Satellite Radio Receiver

Printable View (142 KB)



Item	Part Number	Description
1	W707628-S	Satellite radio receiver screws (4 required)
2	—	Satellite radio receiver electrical connectors (part of 14A464)
3	18806	Satellite radio receiver

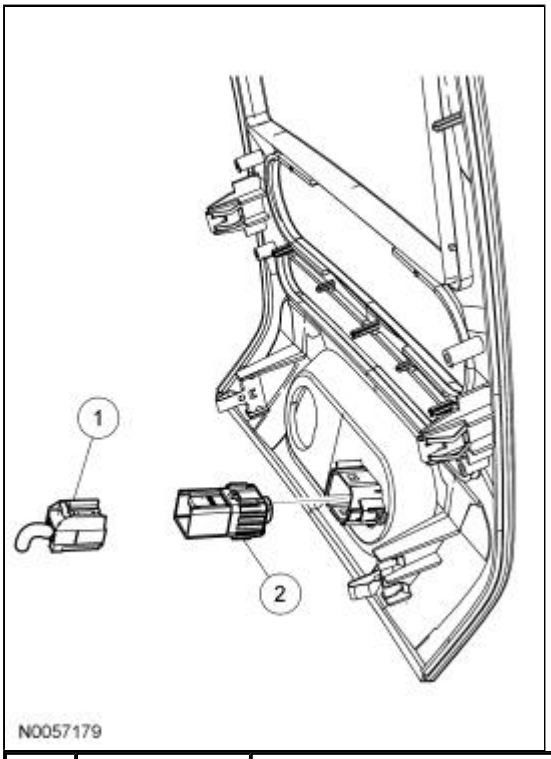
Removal and Installation

1. Remove the center console. For additional information, refer to Section 501-12 .
2. Remove the 4 screws and the satellite radio receiver.
   - Disconnect the electrical connectors.
   - To install, tighten the screws to 8 Nm (71 lb-in).
3. To install, reverse the removal procedure.

Audio Input Jack

Printable View (131 KB)

NOTE: Expedition shown, Navigator similar.



Item	Part Number	Description
1	—	Audio input jack electrical connector (part of 14401)
2	19A164	Audio input jack

Removal and Installation

Expedition

1. Remove the instrument panel center finish panel. For additional information, refer to Section 501-12 .

Navigator

2. Remove the front floor console center finish panel. For additional information, refer to Section 501-12 .

All vehicles

3. Release the tabs and remove the audio input jack.
   - Disconnect the electrical connector.

4. To install, reverse the removal procedure.

Printable View (62 KB)

Torque Specifications

Description	Nm	lb-in
Antenna isolator module stud	8	71
Satellite radio antenna bolt	5	44

Antenna

Printable View (63 KB)

AM/FM Antenna

The AM/FM antenna system consists of the following components:

- Antenna grid (part of right rear quarter glass)
- Antenna module
- 2-piece antenna cable

The antenna receives AM and FM radio waves. The waves are sent to the audio unit through the antenna cable.

The antenna is located on the inside of the right rear quarter glass and can be repaired, but not replaced separately from the glass. For additional information, refer to Section 501-11 .

Satellite Radio Antenna

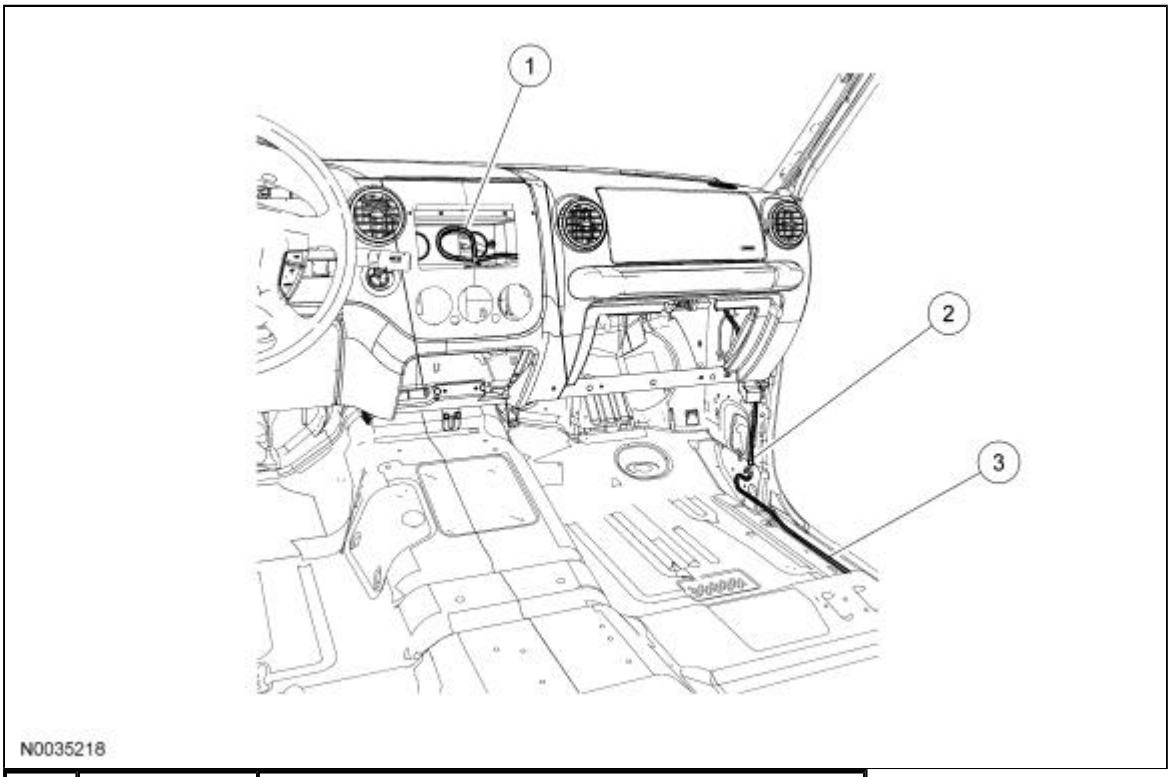
The satellite radio antenna system consists of the following components:

- Satellite radio antenna
- 2-piece satellite radio antenna cable

The satellite radio antenna receives digital audio signals and sends them to the satellite radio receiver through the satellite radio antenna.

Antenna Lead-In Cable — Front

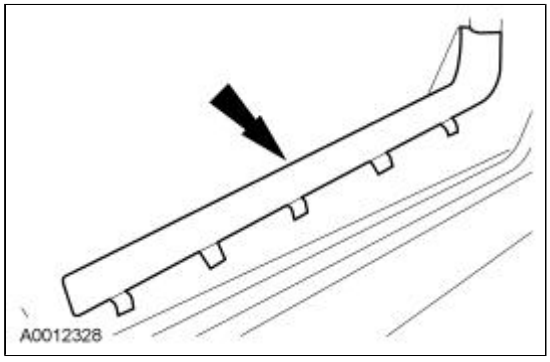
Printable View (197 KB)



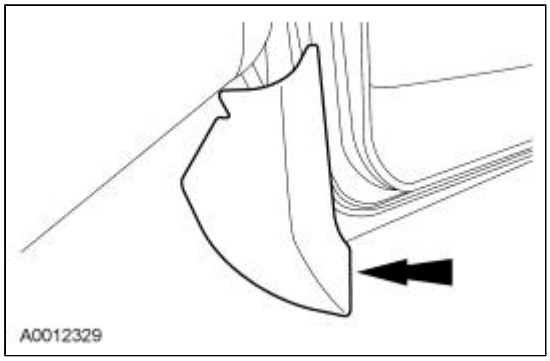
Item	Part Number	Description
1	18812	Antenna lead-in cable — front
2	—	Antenna lead-in cable connection (part of 18812)
3	18812	Antenna lead-in cable — rear

Removal and Installation

1. Remove the audio unit. For additional information, refer to Section 415-01 .
2. Remove the RH scuff plate.



3. Remove the RH A-pillar lower trim panel.



4. Disconnect the rear antenna lead-in cable from the front antenna lead-in cable.

5. **NOTE:** The antenna is an integral part of the wiring harness and cannot be replaced separately from the harness. Cut the ends off the old antenna cable and tape the remainder to the wiring harness to prevent noise.

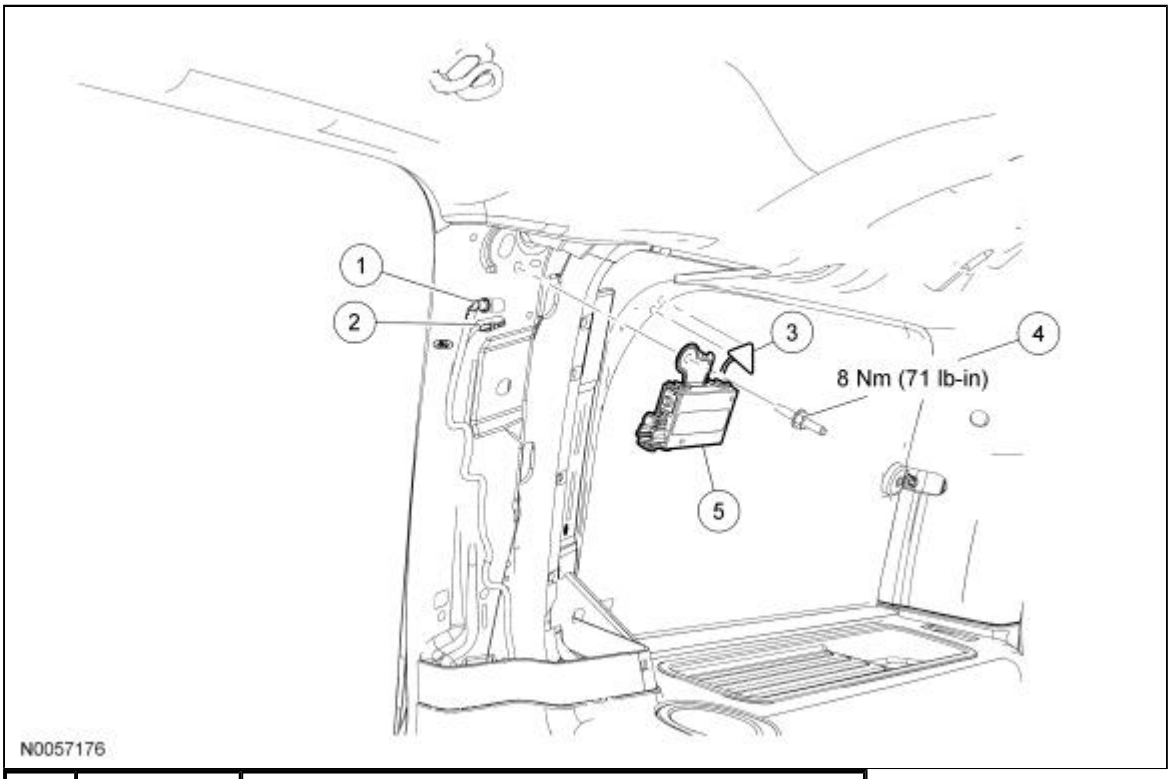
   Remove the ground plate and remove the antenna cable ends.

6. **NOTE:** When installing the new cable, tape or wire-tie the new cable to the wiring harness to prevent noise.

   To install, reverse the removal procedure.

Antenna Isolator Module

Printable View (132 KB)



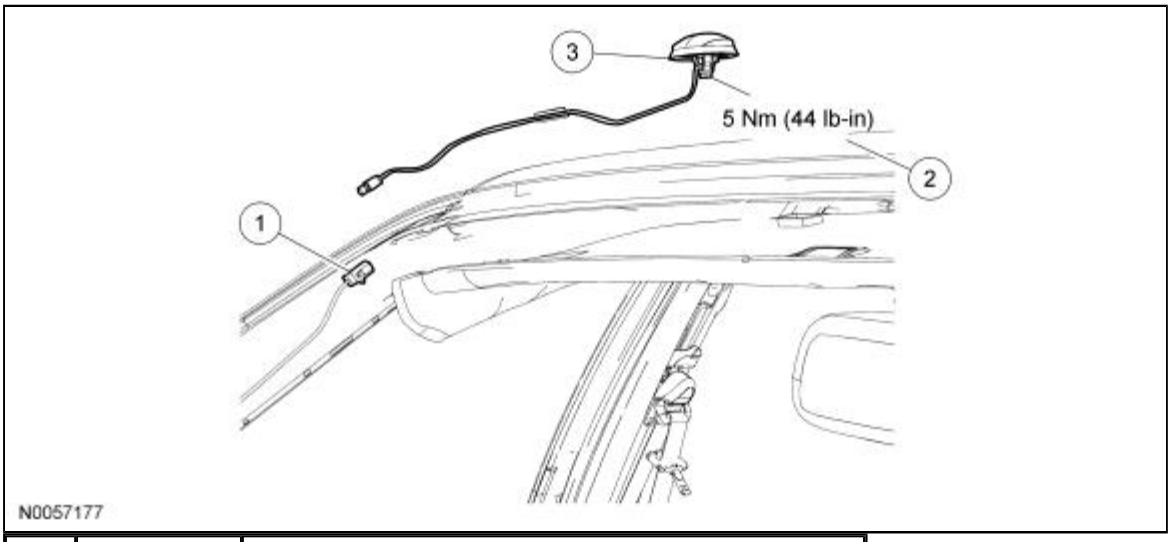
Item	Part Number	Description
1	—	Antenna cable connector (part of 14A005)
2	—	Antenna isolator module electrical connector (part of 14A005)
3	—	Antenna isolator module-to-quarter glass connector (part of 18K891)
4	W710898-S	Antenna isolator module stud
5	18K891	Antenna isolator module

Removal and Installation

1. Remove the RH C-pillar trim panel. For additional information, refer to Section 501-05 .
2. Disconnect the antenna cable connector, the antenna isolator module electrical connector, and the antenna isolator module-to-quarter glass connector.
3. Remove the stud and the antenna isolator module.
   - To install, tighten to 8 Nm (71 lb-in).
4. To install, reverse the removal procedure.

Antenna — Satellite Radio

Printable View (104 KB)



Item	Part Number	Description
1	—	Satellite radio antenna electrical connector (part of 19A397)
2	—	Satellite radio antenna bolt (part of 10E893)
3	10E893	Satellite radio antenna

Removal and Installation

1. Remove the RH A-pillar trim panel. For additional information, refer to Section 501-05 .
2. Remove the RH sun visor. For additional information, refer to Section 501-05 .
3. Disconnect the satellite radio antenna electrical connector.
4. Lower the headliner enough to gain access to the satellite radio antenna bolt.
5. Loosen the bolt and remove the satellite radio antenna.
   - To install, tighten the bolt to 5 Nm (44 lb-in).
6. To install, reverse the removal procedure.

Printable View (62 KB)

Torque Specifications

Description	Nm	lb-ft
Radio frequency interference suppression bond-to-bulkhead screw	12	9
Radio frequency interference suppression bond-to-engine nut	11	8
Radio frequency interference suppression bond frame-to-floorpan screws	12	9

Speakers

Printable View (63 KB)

The following speaker configurations are available:

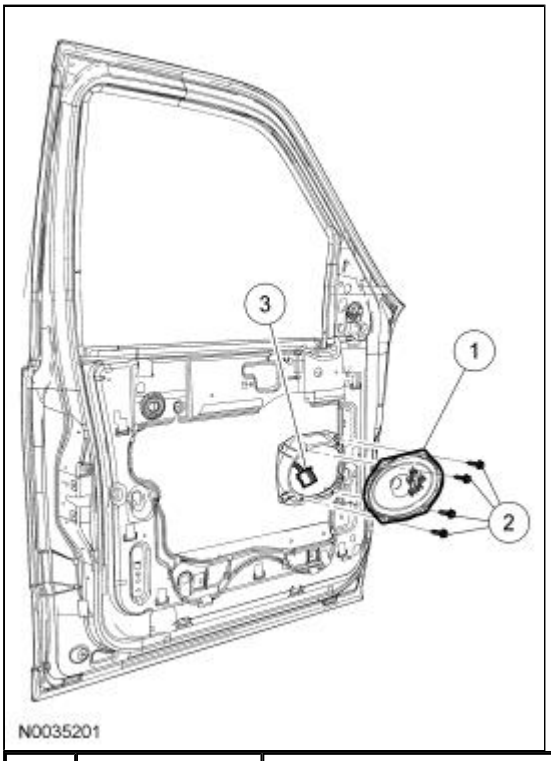
- Base/Premium
  - Two front door speakers
  - Two rear door speakers
  - Two sail-mounted tweeter speakers
- Audiophile
  - Two front door speakers
  - Two rear door speakers
  - Two sail-mounted tweeter speakers
  - Two subwoofers (mounted in a single enclosure)
- THX®
  - Two front door speakers
  - Two rear door speakers
  - Three front center imaging speakers (mounted in a single enclosure)
  - Two D-pillar rear imaging speakers (part of the D-pillar trim panels)
  - Two subwoofers (mounted in a single enclosure)

The THX® audio system is available with either the 6-CD or navigation audio unit.

Door Speaker

Printable View (175 KB)

NOTE: Front door shown, rear door similar.



Item	Part Number	Description
1	18808	Door speaker
2	N806034-S437	Door speaker screws (4 required)
3	—	Door speaker electrical connector (part of door harness)

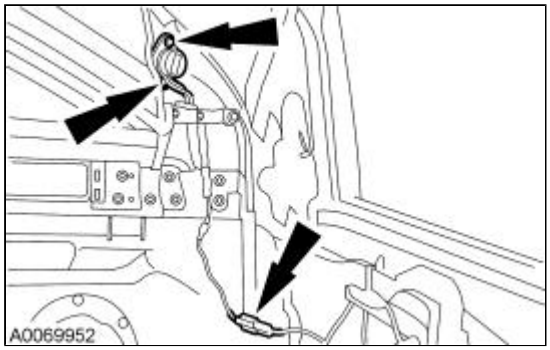
Removal and Installation

All speakers

1. Remove the door trim panels. For additional information, refer to Section 501-05 .

Front door tweeter speaker

2. Remove the 2 screws and the door tweeter speaker.
   - Disconnect the electrical connector.



Front or rear door speaker

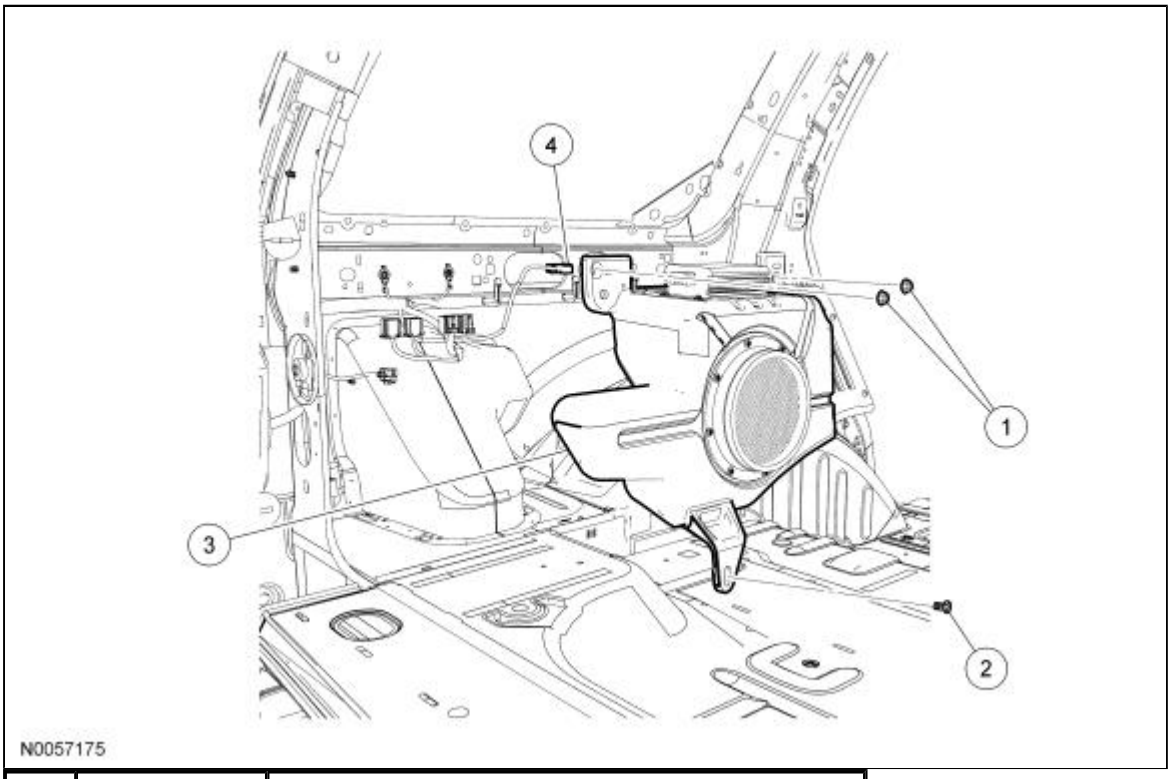
3. Remove the 4 screws and the speaker.
    - Disconnect the electrical connector.

All speakers

4. To install, reverse the removal procedure.

Subwoofer Speaker

Printable View (167 KB)



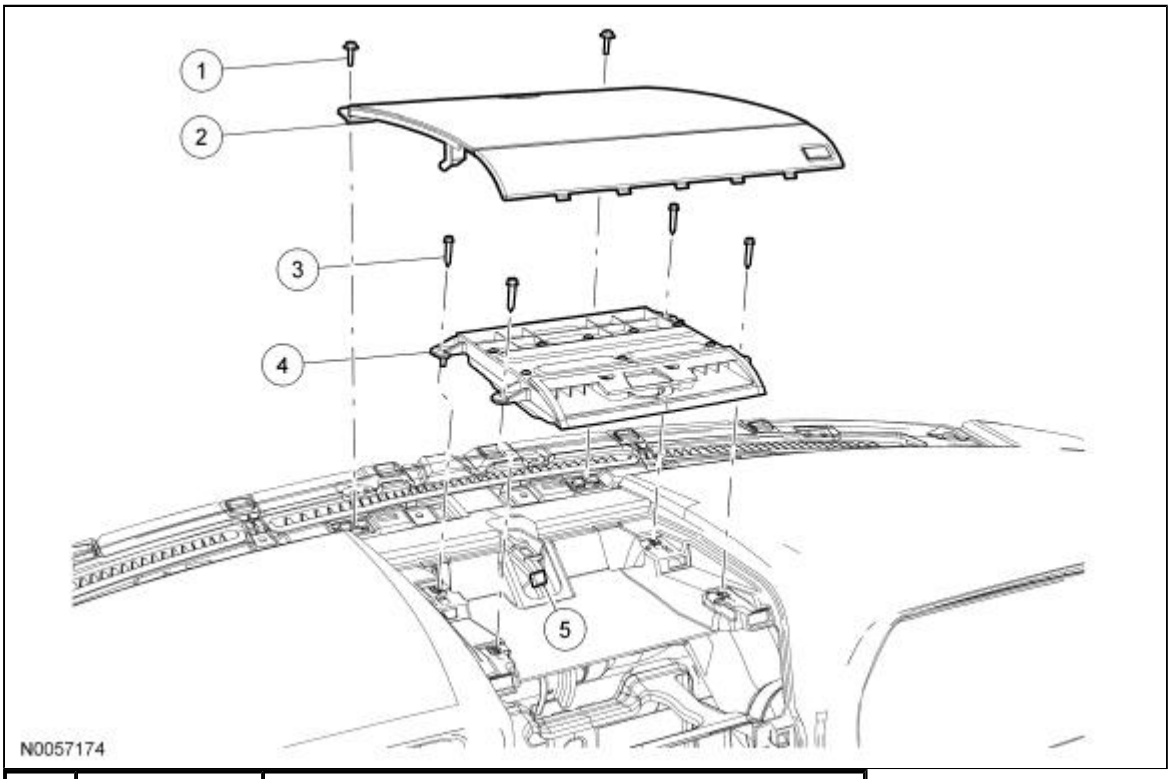
Item	Part Number	Description
1	W704346-S441	Subwoofer speaker nuts (2 required)
2	W712198-S439	Subwoofer speaker bolt
3	18C804	Subwoofer speaker
4	—	Subwoofer speaker electrical connector (part of 14A005)

Removal and Installation

1. Remove the LH quarter trim panel. For additional information, refer to Section 501-05 .
2. Remove the 2 nuts, the bolt, and the subwoofer speaker.
   - Disconnect the electrical connector.
3. To install, reverse the removal procedure.

Instrument Panel Speaker

Printable View (152 KB)



Item	Part Number	Description
1	W707628-S424	Instrument panel speaker cover screws (4 required)
2	78044A92	Instrument panel speaker cover
3	W705961-S403	Instrument panel speaker screws (4 required)
4	18808	Instrument panel speaker
5	—	Instrument panel speaker electrical connector (part of 14401)

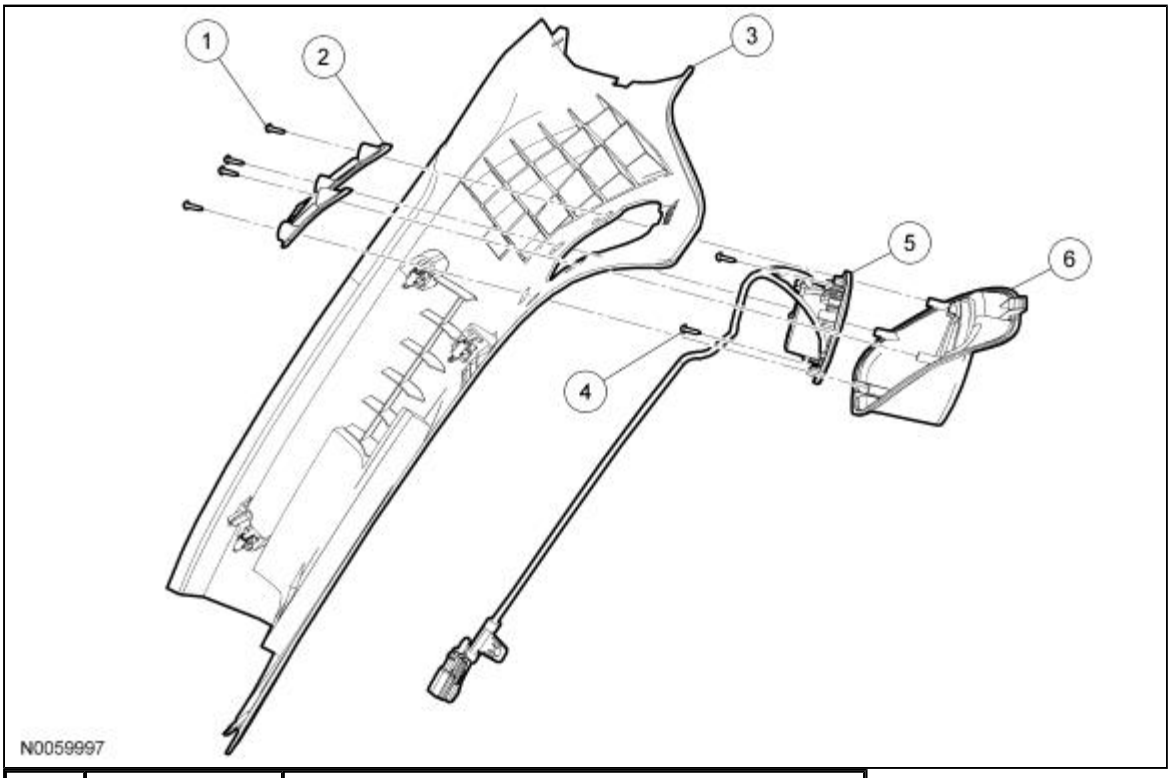
Removal and Installation

1. Remove the instrument panel center finish panel. For additional information, refer to Section 501-12 .
2. Remove the 4 screws and the instrument panel speaker cover.
3. Remove the 4 screws and the instrument panel speaker.
   - Disconnect the electrical connector.
4. To install, reverse the removal procedure.

Quarter Panel Speaker

Printable View (154 KB)

NOTE: RH shown, LH similar.



Item	Part Number	Description
1	—	Speaker bracket screws (4 required)
2	—	Speaker bracket
3	—	D-pillar trim panel
4	—	Quarter panel speaker screws (2 required)
5	—	Quarter panel speaker
6	—	Quarter panel speaker cover

Removal and Installation

1. Remove the D-pillar trim panel. For additional information, refer to Section 501-05 .
2. Remove the 4 screws and the speaker bracket.
3. Separate the quarter panel speaker assembly from the D-pillar trim panel.
4. Remove the 2 screws and the quarter panel speaker.
5. To install, reverse the removal procedure.

Video System

Printable View (62 KB)

The video system consists of the following components:

- Digital versatile disc (DVD) player, mounted to the headliner
- Remote control
- Wireless headphones

The DVD player is not available on vehicles with 1st row bench seat.

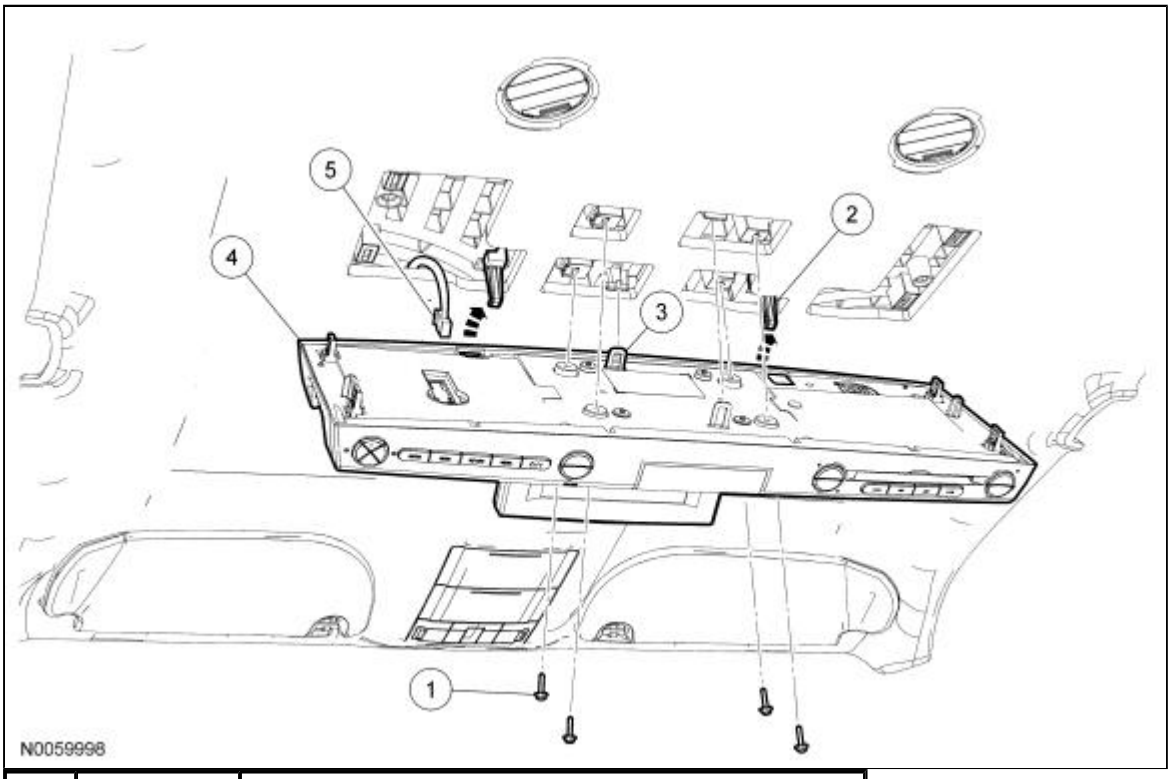
Video System

Printable View (62 KB)

Refer to Section 415-00 .

Digital Versatile Disc (DVD) Player

Printable View (168 KB)



Item	Part Number	Description
1	W704875-S	DVD player screws (4 required)
2	—	J-hook (part of 10E957)
3	—	U-hook (part of 10E947)
4	10E947	DVD player
5	—	Digital versatile disc (DVD) player electrical connector (part of 15A657)

Removal

NOTE: Programmable module installation (PMI) only needs to be carried out if the DVD player is being replaced.

1. Upload the DVD player configuration to the scan tool. For additional information, refer to Section 418-01 .

2. **NOTE:** Open the DVD player display.

   Remove the 4 screws.

3. Remove the DVD player.
   - Pull down on the sides of the DVD player to disengage the clips from the bracket.
   - Using a suitable tool, push the rear most U-hook forward and release the U-hooks.
   - Hang the DVD player on the J-hooks and disconnect the electrical connector.

- Remove the DVD player from the J-hooks.

Installation

1. Hang the DVD player on the J-hooks.
2. Connect the electrical connector.
3. Remove the DVD player from the J-hooks.
4. **NOTE:** Tilt the DVD player, as necessary, to align it correctly.

   Align the left side guide pin with the left side locating hole.
5. Lift up the right side of the DVD player and engage the U-hooks.
6. Install the 4 screws.
7. Push on the left and right sides of the DVD player to engage the clips.
8. Download the DVD player configuration from the scan tool. For additional information, refer to Section 418-01 .

Exterior Lighting

Printable View (85 KB)

NOTE: On vehicles equipped with perimeter lighting, this feature can be enabled or disabled. When enabled, the exterior lamps are illuminated when the UNLOCK button is pressed on the remote keyless entry (RKE) transmitter. For additional information, refer to Section 501-14 .

Headlamps — Expedition

The headlamp system is a dual-beam pattern system. It consists of replaceable low/high beam bulbs. The headlamp assembly has the park/turn indicator lamp integrated into the headlamp assembly. The smart junction box (SJB) supplies voltage to the headlamps when demanded.

If the headlamps are on when the ignition switch is turned off, the battery saver feature turns off the headlamps after 10 minutes have elapsed.

Headlamps — Navigator

The headlamp system is a single-beam pattern system with a shutter used to expose more light at a higher angle when the high beams are activated. It consists of high intensity discharge (HID) headlamps (with replaceable bulbs) and shutters that are integral to the headlamp assembly. There are 2 HID relays located within the battery junction box (BJB) that are used to provide voltage to the ballast located within each headlamp assembly. The headlamp assembly has the park/turn indicator lamp integrated into the headlamp assembly. The SJB supplies voltage to the HID relay coils when demanded.

There is also a separate bulb that is used for the flash-to-pass feature. This bulb also shares functionality as a parking lamp when the parking lamps are on. When the flash-to-pass feature is activated, the brighter filament within the bulb illuminates.

If the headlamps are on when the ignition switch is turned off, the battery saver feature turns off the headlamps after 10 minutes have elapsed.

Autolamps

The autolamp system provides light sensitive automatic on/off control of the exterior lamps. The autolamp system keeps the exterior lamps on for a pre-selected period of time after the ignition switch is turned to the OFF position (20 seconds is the factory default setting). The pre-selected time lapse is adjustable up to approximately 3 minutes. The time delay is programmed through the instrument cluster message center using the message center buttons or using the following steps.

NOTE: Steps 2 through 5 must be carried out within a 10 second period.

1. Start with the ignition switch off and the headlamp switch in the AUTOLAMPS ON position.
2. Place the headlamp switch in the OFF position.
3. Place the ignition switch in the RUN position.
4. Place the ignition switch in the OFF position.
5. Place the headlamp switch in the AUTOLAMPS ON position. The exterior lamps turn on at this point.
6. Wait the desired amount of time and place the headlamp switch in the OFF position (maximum of 3 minutes). The exterior lamps turn off and the autolamp time delay is now set.

Stoplamps

The stoplamps are supplied voltage when the brake pedal is applied.

Turn Signal/Hazard Lamps

The front turn signal lamps are located within the headlamp assemblies. The rear lamps share functionality with the stoplamps. When the multifunction switch is placed in the LH or RH TURN positions, the SJB routes voltage to the LH or RH turn signal lamps. The SJB then cycles the voltage on and off approximately 80 times per minute. If a front or rear turn bulb is inoperative, the SJB cycles the voltage on and off approximately 160 times per minute.

The hazard switch is located on the center instrument panel finish panel. When the hazard switch is pressed, the SJB supplies voltage to all the turn lamps. The SJB cycles the voltage on and off approximately 80 times per minute.

Parking Lamps

The SJB supplies voltage to the parking lamps when demanded. The front parking lamps are located in the headlamp assemblies. The rear parking lamps are located in the rear lamp assemblies.

Fog Lamps

The fog lamp switch is integral to the headlamp switch. When the fog lamp switch is engaged, the SJB provides ground for the fog lamp relay coil (integral to the SJB), which then energizes and routes voltage to the fog lamps. The fog lamps can be turned on when the ignition switch is in the RUN or ACC position, the parking lamps are on, and the high beam headlamps are off.

Reversing Lamps

When the transmission is placed in REVERSE (R), the transmission control module (TCM) provides power and ground for the reversing lamp relay coil. The reversing lamps receive voltage when the reversing lamp relay is energized. The reversing lamps are located within the rear lamp assemblies.

Trailer Tow

The battery junction box (BJB) supplies voltage to the trailer tow stop/turn, parking and reversing lamps. When the vehicle's rear stop/turn or parking lamps are illuminated, voltage is also supplied to a corresponding trailer tow relay (coil side) located in the BJB. When the reversing lamps are illuminated, voltage from the reversing lamp relay is also supplied to the trailer tow connector.

The trailer tow battery charge relay provides voltage to the trailer tow connector when the ignition switch is in the RUN position.

The vehicle comes equipped with circuitry to support trailer tow electric brakes.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

The smart junction box (SJB) monitors the headlamp switch position by sending voltage reference signals on multiple circuits to the headlamp switch. At any given time, one of the signal circuits is routed to ground. If the SJB does not detect any of the inputs to the headlamp switch is active (routed to ground) for 5 seconds, the SJB turns on the exterior lights and keeps them on for 10 minutes after the ignition switch is turned off (or 10 minutes from the time the SJB does not detect any headlamp switch input if the ignition switch was already off). If the SJB detects multiple circuits short to ground, the SJB implements a planned strategy depending on the multiple inputs received. If either of these situations occur, the SJB should **NOT** be ruled immediately as being at fault. This is normal behavior of the SJB design as it has detected a fault with the inputs from the headlamp switch.

The SJB also monitors the multifunction switch for a flash-to-pass or high beam request. There are 2 voltage reference circuits which monitor this. When the multifunction switch is in the FLASH-TO-PASS or HIGH BEAM position, the voltage signal is routed to ground.

NOTE: For Navigator, the high beam indicator does not illuminate with the flash-to-pass feature.

NOTE: The flash-to-pass feature does not require any input from the headlamp switch.

When the SJB receives an input requesting the headlamps on, the SJB supplies voltage to the low beams. If the low beams are on and the SJB receives a request for high beams (or just a flash-to-pass request), the SJB energizes an internal relay which routes voltage to the headlamps (and flash-to-pass lamps for Navigator).

Field-Effect Transistor (FET) Protection

The SJB utilizes a FET protective circuit strategy for many of its outputs (for example, the headlamp

output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault is detected. A continuous DTC is stored at that time for the fault. The circuit will then reset after a customer demand of the function (switching the component on, 30-minute battery saver being energized). When an excessive circuit load occurs several times, the module shuts down the output until a repair procedure is carried out. At the same time, the continuous DTC that was stored on the first failure will not clear by a command to clear the continuous DTCs. The module will not allow this code to be cleared or the circuit restored to normal until a successful on-demand self-test proves that the fault has been repaired. After the on-demand self-test has successfully completed (no on-demand DTCs present), the continuous DTC will have been cleared and the circuit function will return.

The SJB FET protected output circuits for the headlamp system are for the LH low beam output and the RH low beam output circuits.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Headlamp switch
• Multifunction switch
• Headlamp assembly
	• Battery junction box (BJB) fuse(s):
	  ▪ 44 (20A) (LH high intensity discharge [HID] headlamp)
	  ▪ 48 (20A) (RH HID headlamp)
	• Smart junction box (SJB) fuse(s):
	  ▪ 7 (10A) (LH low beam)
	  ▪ 8 (10A) (RH low beam)
	  ▪ 23 (15A) (high beams)
	• Ballast
	• SJB
	• Bulb(s)
	• Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:

- Verify the ignition key is in the ON position.
- Verify the scan tool operation with a known good vehicle.
- Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.

9. If the DTCs retrieved are related to the concern, go to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1472	Lamp Headlamp Input Circuit Short to Ground	Go To Pinpoint Test D .
B1510	Flash To Pass Switch Circuit Short to Ground	Go To Pinpoint Test D .
B1696	Autolamp On Circuit Short To Ground	Go To Pinpoint Test D .

Pinpoint Tests

Pinpoint Test A: The High Beams Are Inoperative

Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

Normal Operation

When the headlamp switch is placed in the HEADLAMPS ON position, the smart junction box (SJB) monitors the high beam request circuit from the multifunction switch through circuit CLF02 (GY/BN). When the multifunction switch is placed in the HIGH BEAM position, the signal is routed to ground through circuit GD138 (BK/WH). The SJB then energizes the high beam relay (integral to the SJB) which supplies voltage to the headlamps (and flash-to-pass lamps, if equipped) through circuit CLF08 (YE/VT).

Possible Causes

- Fuse
- Circuit CLF02 (GY/BN) open
- Circuit CLF08 (YE/VT) open
- Circuit GD138 (BK/WH) open
- Multifunction switch
- SJB

PINPOINT TEST A: THE HIGH BEAMS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
A1 CHECK THE HIGH BEAM INDICATOR • Key in ON position. • Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the HIGH BEAM position. • **Does the high beam indicator illuminate?**	**Yes** GO to A5 . **No** GO to A2 .
A2 CHECK THE MULTIFUNCTION SWITCH • Place the headlamp switch in the OFF position. • Key in OFF position. • Disconnect: Multifunction Switch C202. • Connect a fused (5A) jumper wire between the multifunction switch C202-6, circuit CLF02 (GY/BN), harness side and the multifunction switch C202-8, circuit GD138 (BK/WH), harness side.  N0057365 • Place the headlamp switch in the HEADLAMPS ON position. • Key in ON position. • **Does the high beam indicator illuminate?**	**Yes** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. **No** REMOVE the jumper wire. GO to A3 .

A3 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the multifunction switch C202-8, circuit GD138 (BK/WH), harness side and ground.  N0037266 • **Is the resistance less than 5 ohms?**	**Yes** GO to A4 . **No** REPAIR the circuit. TEST the system for normal operation.
A4 CHECK CIRCUIT CLF02 (GY/BN) FOR AN OPEN	
• Disconnect: SJB C2280g. • Measure the resistance between the multifunction switch C202-6, circuit CLF02 (GY/BN), harness side and the SJB C2280g-27, circuit CLF02 (GY/BN), harness side.  N0057366 • **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** REPAIR the circuit. TEST the system for normal operation.
A5 CHECK CIRCUIT CLF08 (YE/VT) FOR AN OPEN	
• Disconnect: SJB C2280a. • Connect a fused (15A) jumper wire between the SJB C2280a-1, circuit CBB69 (WH/VT), harness side and the SJB C2280a-2, circuit CLF08 (YE/VT), harness side.  N0057367 • **Do the high beams (or flash-to-pass lamps if Navigator) illuminate?**	**Yes** VERIFY the SJB fuse 23 (15A) is OK. If OK, GO to A6 . **No** REPAIR the circuit. TEST the system for normal operation.
A6 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.

• Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: One Low Beam Headlamp Is Inoperative

Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

Normal Operation — Expedition

When the smart junction box (SJB) detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the LOW BEAM position, the SJB provides voltage through circuits CLF04 (BN/BU) and CLF05 (BU/GN) to the LH and RH low beam headlamps, respectively. Ground is supplied on circuits GD120 (BK/GN) and GD123 (BK/GY) for the LH and RH headlamps, respectively.

Normal Operation — Navigator

When the SJB detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the LOW BEAM position, the SJB provides voltage through circuits CLF04 (BN/BU) and CLF05 (BU/GN) to the LH and RH high intensity discharge (HID) relay coils, respectively. Ground for the HID relay coils is provided through circuit GD123 (BK/GY). Switched voltage for the LH and RH HID relays is provided from the battery junction box (BJB) through circuits SBB44 (GN/RD) and SBB48 (VT/RD), respectively. When the relays are energized, voltage is routed to the LH and RH headlamps through circuits CLF30 (VT/BN) and CLF31 (YE/GY), respectively. Ground is supplied on circuits GD120 (BK/GN) and GD123 (BK/GY) for the LH and RH headlamps, respectively. The ballasts within each headlamp steps up the voltage needed to illuminate the HID bulbs.

DTC B2A2E — is an on-demand DTC that sets when the SJB detects an open in the RH low beam output circuit.

DTC B2A2F — is a continuous and on-demand DTC that sets when the SJB detects a short to ground in the RH low beam output circuit.

DTC B2A30 — is an on-demand DTC that sets when the SJB detects an open in the LH low beam output circuit.

DTC B2A31 — is a continuous and on-demand DTC that sets when the SJB detects a short to ground in the LH low beam output circuit.

Possible Causes

- Fuse
- Circuit CLF04 (BN/BU) open or short to ground
- Circuit CLF05 (BU/GN) open or short to ground
- Circuit CLF30 (VT/BN) open
- Circuit CLF31 (YE/GY) open
- Circuit GD120 (BK/GN) open
- Circuit GD123 (BK/GY) open
- Circuit SBB44 (GN/RD) open
- Circuit SBB48 (VT/RD) open
- HID relay
- HID bulb
- Ballast
- Headlamp assembly

- SJB

PINPOINT TEST B: ONE LOW BEAM HEADLAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: For Expedition, due to varying wattage ratings and resulting current draw, certain aftermarket headlamp bulbs may cause the SJB to shut down the short circuit protection, resulting in the low beams becoming inoperative. Verify that the bulbs meet Ford specifications. If the bulbs do not meet Ford specifications, install the correct bulbs. Run the on-demand self-test (required to clear certain DTCs and reset the SJB). Correct any unresolved DTCs. Clear all DTCs. Test the system for normal operation.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>B1 USE THE RECORDED DTCs FROM THE SJB SELF-TEST</td><td rowspan="2">Yes
For DTC B2A2E or B2A30, GO to B2 .

For DTC B2A2F or B2A31, GO to B5 .

For all other DTCs, REFER to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart in this section.

No
For Expedition, GO to B12 .

For Navigator, GO to B7 .</td></tr>
<tr><td>• Check the recorded results from the SJB self-test.
• Were any DTCs recorded?</td></tr>
<tr><td>B2 CHECK THE SJB HEADLAMP VOLTAGE SUPPLY CIRCUIT FOR VOLTAGE</td><td rowspan="2">Yes
For Expedition, REPAIR circuit GD120 (BK/GN) (LH low beam) or circuit GD123 (BK/GY) (RH low beam) for an open. CLEAR the DTCs. REPEAT the self-test.

For Navigator, GO to B4 .

No
VERIFY the SJB fuse 7 (10A) (LH low beam) or fuse 8 (10A) is OK. If OK, GO to B3 .</td></tr>
<tr><td>• Key in OFF position.
• Disconnect: Inoperative Headlamp (Expedition).
• Disconnect: Suspect HID Relay (Navigator).
• Measure the voltage between the inoperative headlamp or suspect HID relay, harness side and ground as follows:

<table><tr><th>Connector-Pin</th><th>Circuit</th></tr><tr><td colspan="2">Expedition</td></tr><tr><td>LH headlamp C1021-1</td><td>CLF04 (BN/BU)</td></tr><tr><td>RH headlamp C1041-1</td><td>CLF05 (BU/GN)</td></tr><tr><td colspan="2">Navigator</td></tr><tr><td>LH HID relay pin 1</td><td>CLF04 (BN/BU)</td></tr><tr><td>RH HID relay pin 1</td><td>CLF05 (BU/GN)</td></tr></table>
• Is the voltage greater than 10 volts?</td></tr>
<tr><td>B3 CHECK THE SJB HEADLAMP VOLTAGE SUPPLY CIRCUIT FOR AN OPEN</td><td rowspan="2">Yes</td></tr>
<tr><td>• Disconnect: SJB C2280a.</td></tr>
</table>

- Measure the resistance between the inoperative headlamp or suspect HID relay, harness side and the SJB as follows:

Headlamp or Suspect HID Relay Connector-Pin	SJB Connector-Pin	Circuit
Expedition		
LH headlamp C1021-1	SJB C2280a-13	CLF04 (BN/BU)
RH headlamp C1041-1	SJB C2280a-4	CLF05 (BU/GN)
Navigator		
LH HID relay pin 1	SJB C2280a-13	CLF04 (BN/BU)
RH HID relay pin 1	SJB C2280a-4	CLF05 (BU/GN)

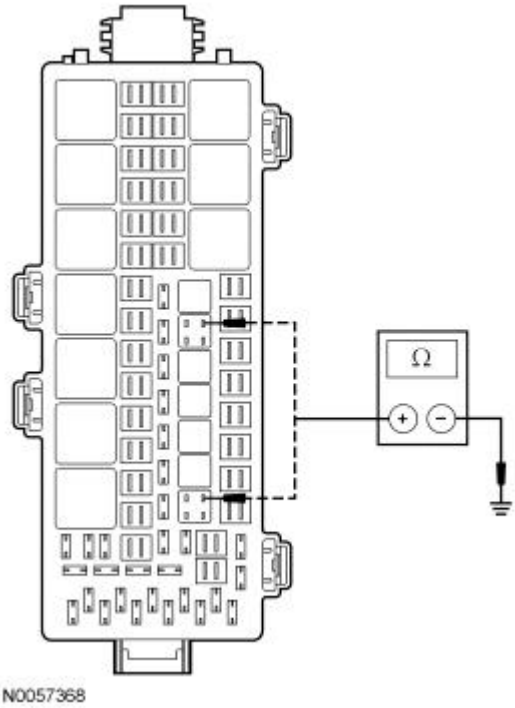
- **Is the resistance less than 5 ohms?**

GO to B12 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

B4 CHECK THE HID RELAY GROUND CIRCUIT FOR AN OPEN

- Measure the resistance between the LH HID relay pin 2, circuit GD123 (BK/GY), harness side and ground; or between the RH HID relay pin 2, circuit GD123 (BK/GY), harness side and ground.



- **Is the resistance less than 5 ohms?**

Yes
INSTALL a new relay in question. CLEAR the DTCs. REPEAT the self-test.

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

B5 CHECK CIRCUIT CLF04 (BN/BU) (LH HEADLAMP) OR CIRCUIT CLF05 (BU/GN) (RH HEADLAMP) FOR A SHORT TO GROUND

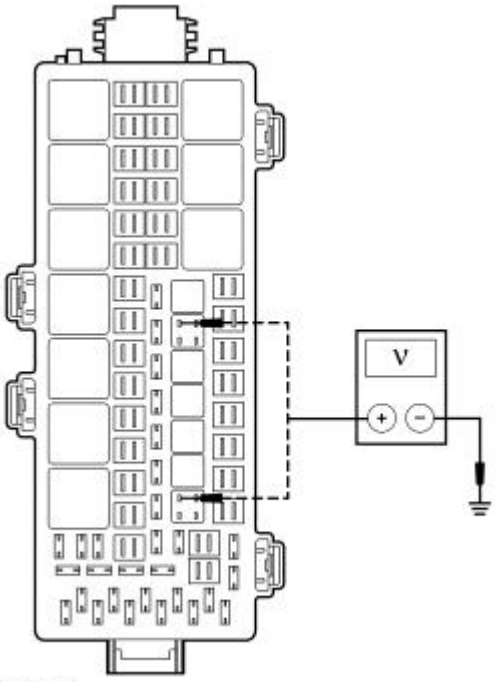
- Key in OFF position.
- Disconnect: SJB C2280a.
- Disconnect: Inoperative Headlamp (Expedition).
- Disconnect: Suspect HID Relay (Navigator).
- Measure the resistance between the inoperative headlamp or suspect HID relay, harness side and ground as follows:

Yes
For Expedition, GO to B12 .

For Navigator, GO to B6 .

No

<table><tr><th>Connector-Pin</th><th>Circuit</th></tr><tr><td colspan="2">Expedition</td></tr><tr><td>LH headlamp C1021-1</td><td>CLF04 (BN/BU)</td></tr><tr><td>RH headlamp C1041-1</td><td>CLF05 (BU/GN)</td></tr><tr><td colspan="2">Navigator</td></tr><tr><td>LH HID relay pin 1</td><td>CLF04 (BN/BU)</td></tr><tr><td>RH HID relay pin 1</td><td>CLF05 (BU/GN)</td></tr></table> • **Is the resistance greater than 10,000 ohms?**	REPAIR the circuit in question. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
B6 CHECK THE HID RELAY (DTC B2A2F or B2A31) • Carry out the HID relay component test. Refer to Wiring Diagrams Cell 149 , Component Testing for schematic and connector information. • **Is the HID relay OK?**	**Yes** GO to B12 . **No** INSTALL a new HID relay. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
B7 CHECK THE HID RELAY (NO DTCs) • Key in OFF position. • Disconnect: Suspect HID Relay. • Carry out the HID relay component test. Refer to Wiring Diagrams Cell 149 , Component Testing for schematic and connector information. • **Is the HID relay OK?**	**Yes** GO to B8 . **No** INSTALL a new HID relay. TEST the system for normal operation.
B8 CHECK CIRCUIT SBB44 (GN/RD) (LH HID RELAY) OR CIRCUIT SBB48 (VT/RD) (RH HID RELAY) FOR AN OPEN • Measure the voltage between the LH HID relay pin 3, circuit SBB44 (GN/RD), harness side and ground; or between the RH HID relay pin 3, circuit SBB48 (VT/RD), harness side and ground.	**Yes** GO to B9 . **No** VERIFY the BJB fuse 44 (20A) (LH HID relay) or fuse 48 (20A) (RH HID relay) is OK. If OK, REPAIR the circuit in question. TEST the system for normal operation.



N0057369

- **Is the voltage greater than 10 volts?**

B9 CHECK CIRCUIT CLF30 (VT/BN) (LH HEADLAMP) OR CIRCUIT CLF31 (YE/GY) (RH HEADLAMP) FOR AN OPEN	
• Connect: Suspect HID Relay. • Disconnect: Inoperative Headlamp. • Place the headlamp switch in the HEADLAMPS ON position. • Measure the voltage between the LH headlamp C133-6, circuit CLF30 (VT/BN), harness side and ground; or between the RH headlamp C134-6, circuit CLF31 (YE/GY), harness side and ground.  N0060156 • **Is the voltage greater than 10 volts?**	**Yes** GO to B10 . **No** REPAIR the circuit in question. TEST the system for normal operation.
B10 CHECK THE HEADLAMP HARNESS	
• Place the headlamp switch in the OFF position. • Disconnect: Suspect Ballast. • Measure the resistance between the headlamp assembly, component side and the suspect ballast, harness side as follows:	**Yes** GO to B11 . **No** REPAIR or INSTALL a new headlamp assembly. REFER to Headlamp Assembly in this section. TEST the system for normal operation.

Inoperative Headlamp Connector-Pin	Ballast Connector-Pin	Circuit
LH headlamp C133 pin 6	C1284-3	1338 (WH)
LH headlamp C133 pin 4	C1284-2	57 (BK)

RH headlamp C134 pin 6	C1285-3	1338 (WH)
RH headlamp C134 pin 4	C1285-2	57 (BK)

- **Is the resistance less than 5 ohms?**

B11 CHECK THE BALLAST	
• Install a known good ballast. • Connect: Inoperative Headlamp. • Connect: Suspect Ballast. • Place the headlamp switch in the HEADLAMPS ON position. • **Does the inoperative headlamp now illuminate?**	**Yes** INSTALL a new ballast. REFER to Ballast in this section. TEST the system for normal operation. **No** INSTALL a new HID bulb. REFER to Headlamp Bulb in this section. TEST the system for normal operation.
B12 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: One High Beam Headlamp Is Inoperative

Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

Normal Operation — Expedition

When the smart junction box (SJB) detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the HIGH BEAM position, the SJB energizes an internal relay. When the relay is energized, the relay routes voltage through circuit CLF08 (YE/VT) to the high beams. Ground for the high beams is shared with the low beams.

Normal Operation — Navigator

When the SJB detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the HIGH BEAM position, the SJB energizes an internal relay. When the relay is energized, the relay routes voltage through circuit CLF08 (YE/VT) to the headlamps and the flash-to-pass lamps. If the low beams are on, a shutter within each headlamp activates to give the appearance of high beam headlamps. Ground for the LH and RH flash-to-pass lamps is provided through circuits GD120 (BK/GN) and GD123 (BK/GY), respectively.

Possible Causes

- Circuit CLF08 (YE/VT) open
- Circuit GD120 (BK/GN) open
- Circuit GD123 (BK/GY) open

- Headlamp assembly

PINPOINT TEST C: ONE HIGH BEAM HEADLAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>C1 CHECK THE LOW BEAM OPERATION
• Check the operation of the low beams.
• Do the low beams operate correctly.</td><td>Yes
For Expedition, REPAIR circuit CLF08 (YE/VT) for an open. TEST the system for normal operation.

For Navigator, GO to C2 .

No
Go To Pinpoint Test B .</td></tr>
<tr><td>C2 CHECK CIRCUIT CLF08 (YE/VT) FOR AN OPEN
• Key in OFF position.
• Disconnect: Inoperative Headlamp or Flash-to-Pass Lamp.
• Place the headlamp switch in the HEADLAMPS ON position.
• Place the multifunction switch in the HIGH BEAM position.
• Measure the voltage between the inoperative lamp, harness side and ground as follows:
<table><tr><th>Inoperative Lamp</th><th>Connector-Pin</th><th>Circuit</th></tr><tr><td>LH headlamp</td><td>C133-7</td><td>CLF08 (YE/VT)</td></tr><tr><td>RH headlamp</td><td>C134-7</td><td>CLF08 (YE/VT)</td></tr><tr><td>LH flash-to-pass</td><td>C1549-3</td><td>CLF08 (YE/VT)</td></tr><tr><td>RH flash-to-pass</td><td>C1550-3</td><td>CLF08 (YE/VT)</td></tr></table>• Is the voltage greater than 10 volts?</td><td>Yes
For the headlamp, REPAIR or INSTALL a new headlamp assembly. REFER to Headlamp Assembly in this section. TEST the system for normal operation.

For the flash-to-pass lamp, REPAIR circuit GD120 (BK/GN) (LH) or circuit GD123 (BK/GY) (RH) for an open. TEST the system for normal operation.

No
REPAIR the circuit. TEST the system for normal operation.</td></tr>
</table>

Pinpoint Test D: The Headlamps Are On Continuously

Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

Normal Operation — Low Beams, Expedition

The smart junction box (SJB) sends reference signals to the headlamp switch through circuits CLF19 (VT/GN), CLF23 (WH/VT), CLF24 (YE/BU) and CLS05 (BU/GY). At any given time, the headlamp switch routes one of the input circuits to ground through circuit GD138 (BK/WH).

When the SJB detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the LOW BEAM position, the SJB provides voltage through circuits CLF04 (BN/BU) and CLF05 (BU/GN) to the LH and RH low beam headlamps, respectively.

Normal Operation — Low Beams, Navigator

The SJB sends reference signals to the headlamp switch through circuits CLF19 (VT/GN), CLF23 (WH/VT), CLF24 (YE/BU) and CLS05 (BU/GY). At any given time, the headlamp switch routes one of the input circuits to ground through circuit GD138 (BK/WH).

When the SJB detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the LOW BEAM position, the SJB provides voltage through circuits CLF04 (BN/BU) and CLF05 (BU/GN) to the LH and RH high intensity discharge (HID) relay coils, respectively. When the relays are energized, voltage is routed to the LH and RH headlamps through circuits CLF30 (VT/BN) and CLF31 (YE/GY), respectively.

Normal Operation — High Beam Headlamps

The SJB sends a reference signal to the multifunction switch through circuits CLF02 (GY/BN) and CLF27 (GN/BN). When the multifunction switch is placed in the FLASH-TO-PASS or HIGH BEAM position, the voltage signal is routed to ground. When the SJB detects a request for flash-to-pass or high beams (when the low beams are on), the SJB energizes the high beam relay (integral to the SJB), which routes voltage through circuit CLF08 (YE/VT) to the headlamps (and flash-to-pass lamps for Navigator).

DTC B1472 — is an on-demand DTC that sets when the SJB detects the headlamps on input circuit is short to ground.

DTC B1510 — is an on-demand DTC that sets when the SJB detects the flash-to-pass request input circuit is short to ground.

DTC B1696 — is an on-demand DTC that sets when the SJB detects the autolamps on request input circuit is short to ground.

DTC B2A22 — is an on-demand DTC that sets when the SJB detects an open from the headlamp switch off circuit.

DTC B2A23 — is an on-demand DTC that sets when the SJB detects a short to ground on the high beam request input circuit.

DTC B2A2E — is an on-demand DTC that sets when the SJB detects a short to voltage from the RH low beam output circuit.

DTC B2A30 — is an on-demand DTC that sets when the SJB detects a short to voltage from the LH low beam output circuit.

Possible Causes

- Circuit CLF02 (GY/BN) short to ground
- Circuit CLF04 (BN/BU) short to voltage
- Circuit CLF05 (BU/GN) short to voltage
- Circuit CLF08 (YE/VT) short to voltage
- Circuit CLF19 (VT/GN) open or short to ground
- Circuit CLF23 (WH/VT) open
- Circuit CLF24 (YE/BU) short to ground
- Circuit CLF27 (GN/BN) short to ground
- Circuit CLF30 (VT/BN) short to voltage
- Circuit CLF31 (YE/GY) short to voltage
- Circuit CLS05 (BU/GY) open
- Circuit GD138 (BK/WH) open

- HID relay
- Multifunction switch
- Headlamp switch
- SJB

PINPOINT TEST D: THE HEADLAMPS ARE ON CONTINUOUSLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
D1 VERIFY THE HEADLAMP OPERATION	
• Key in ON position. • **Are the high beam headlamps or flash-to-pass lamps illuminated?**	**Yes** GO to D10 . **No** GO to D2 .
D2 CHECK THE SJB HEADLAMP SWITCH PIDs	
• Enter the following diagnostic mode on the diagnostic tool: SJB Headlamp Switch PIDs. • **NOTE:** Make sure the headlamp switch is lined up in the correct position when monitoring the PIDs. • Monitor all the SJB headlamp switch input PIDs while moving the headlamp switch through all positions. • **Do the headlamp switch positions agree with the PIDs?**	**Yes** GO to D7 . **No** GO to D3 .
D3 CHECK THE HEADLAMP SWITCH	
• Key in OFF position. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** GO to D4 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.
D4 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Measure the resistance between the headlamp switch C205-7, circuit GD138 (BK/WH), harness side and ground.  N0057370 • **Is the resistance less than 5 ohms?**	**Yes** GO to D5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
D5 CHECK THE HEADLAMP SWITCH INPUT CIRCUITS FOR A SHORT TO GROUND	
• Disconnect: SJB C2280g.	**Yes**

• Measure the resistance between the headlamp switch, harness side and ground as follows: **Headlamp Switch Connector-Pin** / **Circuit** C205-4 (if equipped with autolamps) / CLF19 (VT/GN) C205-10 / CLF24 (YE/BU) • **Are the resistances greater than 10,000 ohms?**	GO to D6 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
D6 CHECK THE HEADLAMP SWITCH INPUT CIRCUITS FOR AN OPEN	
• Measure the resistance between the headlamp switch, harness side and the SJB, harness side as follows: **Headlamp Switch Connector-Pin** / **SJB Connector-Pin** / **Circuit** C205-4 (if equipped with autolamps) / C2280g-19 / CLF19 (VT/GN) C205-9 / C2280g-47 / CLF23 (WH/VT) C205-5 / C2280g-31 / CLS05 (BU/GY) • **Are the resistances less than 5 ohms?**	**Yes** GO to D13 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
D7 CHECK THE SJB OUTPUT	
• Disconnect: SJB C2280a. • **Does the LH or RH headlamp continue to illuminate?**	**Yes** For Expedition, REPAIR circuit CLF04 (BN/BU) (LH headlamp) or circuit CLF05 (BU/GN) (RH headlamp) for a short to voltage as necessary. CLEAR the DTCs. REPEAT the self-test. For Navigator, GO to D8 . **No** GO to D13 .
D8 CHECK CIRCUIT CLF30 (VT/BN) (LH HEADLAMP) OR CIRCUIT CLF31 (YE/GY) (RH HEADLAMP) FOR A SHORT TO VOLTAGE	
• Disconnect: Suspect HID Relay. • **Does the LH or RH headlamp continue to illuminate?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** GO to D9 .
D9 CHECK THE HID RELAY	
• Carry out the HID relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the HID relay OK?**	**Yes** REPAIR circuit CLF04 (BN/BU) (LH HID relay) or circuit CLF05 (BU/GN) (RH HID relay) as necessary. CLEAR the DTCs. REPEAT

	the self-test. **No** INSTALL a new HID relay. CLEAR the DTCs. REPEAT the self-test.
D10 CHECK CIRCUIT CLF08 (YE/VT) FOR A SHORT TO VOLTAGE • Key in OFF position. • Disconnect: SJB C2280a. • Key in ON position. • **Do the high beams continue to illuminate?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to D11 .
D11 CHECK THE MULTIFUNCTION SWITCH • Key in OFF position. • Connect: SJB C2280a. • Disconnect: Multifunction Switch C202. • Key in ON position. • **Do the high beams continue to illuminate?**	**Yes** GO to D12 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test.
D12 CHECK CIRCUIT CLF02 (GY/BN) (HIGH BEAM) OR CIRCUIT CLF27 (GN/BN) (FLASH-TO-PASS) FOR A SHORT TO GROUND • Key in OFF position. • Disconnect: SJB C2280g. • Measure the resistance between the multifunction switch C202-6, circuit CLF02 (GY/BN), harness side and ground; and between the multifunction switch C202-4, circuit CLF27 (GN/BN), harness side and ground.  N0037272 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to D13 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

D13 CHECK FOR CORRECT SJB OPERATION
• Key in OFF position.
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR

	the DTCs. REPEAT the self-test.

Pinpoint Test E: The Flash-To-Pass Feature Is Inoperative

Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a reference signal to the multifunction switch through circuit CLF27 (GN/BN). When the multifunction switch is placed in the FLASH-TO-PASS position, the voltage signal is routed to ground. When the SJB detects a request for the flash-to-pass, the SJB energizes the high beam relay (integral to the SJB), which supplies voltage to the headlamps (and flash-to-pass lamps if equipped)

Possible Causes

- Circuit CLF27 (GN/BN) open
- Multifunction switch
- SJB

PINPOINT TEST E: THE FLASH-TO-PASS FEATURE IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
E1 VERIFY THE HIGH BEAM HEADLAMP OPERATION	
• Key in ON position. • Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the HIGH BEAM position while observing the headlamps. • **Do the high beam headlamps illuminate?**	**Yes** GO to E2 . **No** Go To Pinpoint Test A .
E2 CHECK THE MULTIFUNCTION SWITCH	
• Key in OFF position. • Disconnect: Multifunction Switch C202. • Connect a fused (5A) jumper wire between the multifunction switch C202-4, circuit CLF27 (GN/BN), harness side and the multifunction switch C202-8, circuit GD138 (BK/WH), harness side.  N0037273 • **Does the flash-to-pass feature operate correctly?**	**Yes** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. **No** REMOVE the jumper wire. GO to E3 .
E3 CHECK CIRCUIT CLF27 (GN/BN) FOR AN OPEN	

• Disconnect: SJB C2280g. • Measure the resistance between the multifunction switch C202-4, circuit CLF27 (GN/BN), harness side and the SJB C2280g-43, circuit CLF27 (GN/BN), harness side.  N0057371 • **Is the resistance less than 5 ohms?**	**Yes** GO to E4 . **No** REPAIR the circuit. TEST the system for normal operation.
E4 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Autolamps

Printable View (182 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: For additional information on the perimeter lighting feature, refer to Section 501-14 .

The smart junction box (SJB) monitors the headlamp switch position by sending voltage reference signals on multiple circuits to the headlamp switch. At any given time, one of the signal circuits is routed to ground. If the SJB does not detect any of the inputs to the headlamp switch is active (routed to ground) for 5 seconds, the SJB turns on the exterior lights and keeps them on for 10 minutes after the ignition switch is turned off (or 10 minutes from the time the SJB does not detect any headlamp switch input if the ignition switch was already off). If the SJB detects multiple circuits short to ground, the SJB implements a planned strategy depending on the multiple inputs received. If either of these situations occur, the SJB should **NOT** be ruled immediately as being at fault. This is normal behavior of the SJB design as it has detected a fault with the inputs from the headlamp switch.

The SJB also monitors the light sensor with a voltage reference signal. The light sensor input to the SJB varies with the ambient light conditions.

When the SJB receives an input from the headlamp switch indicating a request for the autolamps, the SJB monitors the light sensor for the ambient light condition. If the SJB determines the ambient light level is dark, the SJB supplies voltage to the exterior lamps.

If the ignition switch is already in the RUN position and the vehicle enters darkness/lighted area (such as when entering/exiting a non-lighted tunnel during the daytime), the transition from light to dark (or dark to light) needs to last 15 seconds before the SJB turns on the exterior lamps. This strategy is to prevent the exterior lamps from unnecessarily flashing on and off.

The SJB does react quicker under extreme light conditions. If the SJB has detected a very dark condition, the exterior lamps are turned on after 1.5 seconds. If the SJB has detected a very high

ambient light level, the exterior lamps are turned off after 4 seconds.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

   Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch	• Circuitry • Light sensor • Smart junction box (SJB)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.

9. If the DTCs retrieved are related to the concern, go to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1472	Lamp Headlamp Input Circuit Short to Ground	Go To Pinpoint Test G .
B1696	Autolamp On Circuit Short To Ground	Go To Pinpoint Test G .
B1791	Autolamp Sensor Input Circuit Open	Go To Pinpoint Test G .
B1793	Autolamp Sensor Input Circuit Short to Ground	Go To Pinpoint Test G .
All other DTCs	—	REFER to Section 419-10 .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Circuitry • SJB	• REFER to Section 418-00 .
• The autolamps are inoperative	• Light sensor • SJB	• Go To Pinpoint Test F .
• The autolamps are on continuously	• Circuitry • Light sensor • Headlamp switch • Electronic automatic temperature control (EATC) system • SJB	• Go To Pinpoint Test G .
• The autolamp time delay is inoperative	• SJB	• CHECK the SJB configuration and make sure the autolamp feature is configured correctly. ▪ If the SJB is configured correctly, INSTALL a new SJB. REFER to Section 419-10 . ▪ If the SJB is not configured correctly, RECONFIGURE the SJB. REFER to Section 418-01 . TEST the system for normal operation.
• The headlamps are inoperative with the autolamps on	• SJB	• REFER to Headlamps in this section.
• The parking lamps are inoperative with the autolamps on	• SJB	• REFER to Parking, Rear and License Plate Lamps in this section.

Pinpoint Tests

Pinpoint Test F: The Autolamps Are Inoperative

Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

Normal Operation

When the smart junction box (SJB) detects the headlamp switch in the AUTOLAMPS ON position, the SJB monitors the light sensor input. The light sensor determines the amount of light based on the input received from the ambient sky conditions. When the ambient level has reached a point (determined by the internal programming of the SJB), the SJB provides voltage to the headlamps, parking and license plate lamps.

Possible Causes

- Light sensor
- SJB

PINPOINT TEST F: THE AUTOLAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
F1 CHECK THE MANUAL HEADLAMP OPERATION	
• Place the headlamp switch in the HEADLAMPS ON position. • **Do the headlamps operate correctly?**	**Yes** GO to F2 . **No** REFER to Headlamps in this section.
F2 CHECK FOR VOLTAGE TO THE LIGHT SENSOR	
• Key in OFF position. • Disconnect: Light Sensor C286 or C2360. • Key in ON position. • Place the headlamp switch in the AUTOLAMPS ON position. • On vehicles with EATC, measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  N0057372 • On vehicles with manual temperature control, measure the voltage between the light sensor C2360-1, circuit VLF14 (BU/BN), harness side and ground.	**Yes** INSTALL a new light sensor. REFER to Light Sensor in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to F3 .

 N0057373 • **Is the voltage approximately 5 volts?**	
F3 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: The Autolamps Are On Continuously

Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a reference signal to the headlamp switch through circuit CLF19 (VT/GN) and a signal to the light sensor through circuit VLF14 (BU/BN). On vehicles with manual climate control, ground for the light sensor is provided by circuit GD133 (BK). On vehicles with electronic automatic temperature control (EATC), ground for the light sensor is provided by the EATC module through circuit RH111 (GY/BU).

When the headlamp switch is placed in the AUTOLAMPS ON position, the voltage signal is routed to ground. When the SJB detects the headlamp switch in the AUTOLAMPS ON position, the SJB monitors the light sensor input. The light sensor determines the amount of light based on the input received from the ambient sky conditions. When the ambient level has reached a point (determined by the internal programming of the SJB), the SJB provides voltage to the headlamps, parking and license plate lamps.

DTC B1472 — is an on-demand DTC that sets when the SJB detects the headlamps on input circuit is short to ground.

DTC B1696 — is an on-demand DTC that sets when the SJB detects a short to ground in the autolamps on input circuit.

DTC B1791 — is an on-demand DTC that sets when the SJB detects an open on the light sensor input circuit.

DTC B1793 — is a continuous and on-demand DTC that sets when the SJB detects a short to ground on the light sensor input circuit.

DTC B2A22 — is an on-demand DTC that sets when the SJB detects an open from the headlamp switch off circuit.

Possible Causes

- Circuit CLF19 (VT/GN) open or short to ground
- Circuit CLF23 (WH/VT) open
- Circuit CLF24 (YE/BU) short to ground
- Circuit CLS05 (BU/GY) open
- Circuit GD133 (BK) open
- Circuit GD138 (BK/WH) open
- Circuit RH111 (GY/BU) open
- Circuit VLF14 (BU/BN) open, short to ground or voltage
- Light sensor
- Headlamp switch
- EATC system
- SJB

PINPOINT TEST G: THE AUTOLAMPS ARE ON CONTINUOUSLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
G1 USE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB self-test. • **Was DTC B1791 or B1793 recorded?**	**Yes** For DTC B1791, GO to G7 . For DTC B1793, GO to G11 . **No** GO to G2 .
G2 CHECK THE SJB HEADLAMP SWITCH PIDs	
• Enter the following diagnostic mode on the diagnostic tool: SJB Headlamp Switch PIDs. • **NOTE:** Make sure the headlamp switch is lined up in the correct position when monitoring the PIDs. • Monitor all the SJB headlamp switch input PIDs while moving the headlamp switch through all positions. • **Do the headlamp switch positions agree with the PIDs?**	**Yes** GO to G7 . **No** GO to G3 .
G3 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN (HEADLAMP SWITCH)	
• Measure the resistance between the headlamp switch C205-7, circuit GD138 (BK/WH), harness side and ground.  	**Yes** GO to G4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

- **Is the resistance less than 5 ohms?**

G4 CHECK THE HEADLAMP SWITCH

- Key in OFF position.
- Disconnect: Headlamp Switch C205.
- Carry out the headlamp switch component test.

  Refer to Wiring Diagrams Cell 149 for schematic and connector information.

- **Is the headlamp switch OK?**

Yes
GO to G5 .

No
INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.

G5 CHECK THE HEADLAMP SWITCH INPUT CIRCUITS FOR A SHORT TO GROUND

- Disconnect: SJB C2280g.
- Measure the resistance between the headlamp switch, harness side and ground as follows:

Headlamp Switch Connector-Pin	Circuit
C205-4 (if equipped with autolamps)	CLF19 (VT/GN)
C205-10	CLF24 (YE/BU)

- **Are the resistances greater than 10,000 ohms?**

Yes
GO to G6 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

G6 CHECK THE HEADLAMP SWITCH INPUT CIRCUITS FOR AN OPEN

- Measure the resistance between the headlamp switch, harness side and the SJB, harness side as follows:

Headlamp Switch Connector-Pin	SJB Connector-Pin	Circuit
C205-4 (if equipped with autolamps)	C2280g-19	CLF19 (VT/GN)
C205-9	C2280g-47	CLF23 (WH/VT)
C205-5	C2280g-31	CLS05 (BU/GY)

- **Are the resistances less than 5 ohms?**

Yes
GO to G13 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

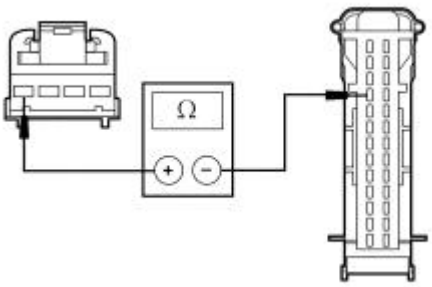
G7 CHECK CIRCUIT RH111 (GY/BU) OR CIRCUIT GD133 (BK) FOR AN OPEN

NOTE: If the vehicle is equipped with an EATC system, make sure the EATC system operates correctly before attempting to continue diagnosis of the autolamp system.

- Key in OFF position.
- Disconnect: Light Sensor C286 or C2360.
- Disconnect: EATC Module C228a.
- On vehicles with EATC, measure the resistance between the light sensor C286-4, circuit RH111 (GY/BU), harness side and the EATC module C228a-10, circuit RH111 (GY/BU), harness side.

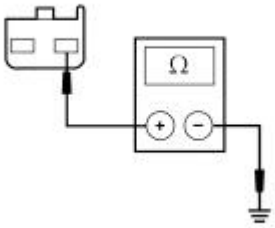
Yes
GO to G8 .

No
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.



N0057376

- On vehicles with manual climate control, measure the resistance between the light sensor C2360-2, circuit GD133 (BK), harness side and ground.

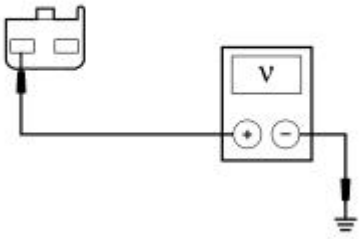


N0057377

- **Is the resistance less than 5 ohms?**

G8 CHECK CIRCUIT VLF14 (BU/BN) FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280g. • Key in ON position. • On vehicles with EATC, measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  N0057372 • On vehicles with manual climate control, measure the voltage between the light sensor C2360-1, circuit VLF14 (BU/BN), harness side and ground.  N0057373 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to G9 .

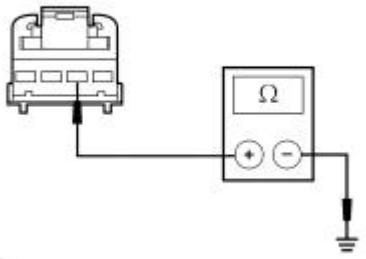
G9 CHECK CIRCUIT VLF14 (BU/BN) FOR AN OPEN	
• Key in OFF position. • On vehicles with EATC, measure the resistance between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and the SJB C2280g-46, circuit VLF14 (BU/BN), harness side.  N0057378 • On vehicles with manual climate control, measure the resistance between the light sensor C2360-1, circuit VLF14 (BU/BN), harness side and the SJB C2280g-46, circuit VLF14 (BU/BN), harness side.  N0057379 • **Is the resistance less than 5 ohms?**	**Yes** GO to G10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
G10 CHECK FOR VOLTAGE TO THE LIGHT SENSOR (DTC B1791)	
• Connect: SJB C2280g. • Key in ON position. • Place the headlamp switch in the AUTOLAMPS ON position. • On vehicles with EATC, measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  N0057372 • On vehicles with manual climate control, measure the voltage between the light sensor C2360-1, circuit VLF14 (BU/BN), harness side and ground.	**Yes** INSTALL a new light sensor. REFER to Light Sensor in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to G13 .



N0057373

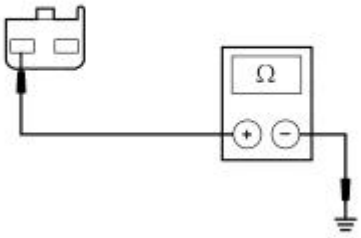
- **Is the voltage approximately 5 volts?**

G11 CHECK FOR VOLTAGE TO THE LIGHT SENSOR (DTC B1793)	
• Disconnect: Light Sensor C286 or C2360. • Key in ON position. • Place the headlamp switch in the AUTOLAMPS ON position. • On vehicles with EATC, measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  N0057372 • On vehicles with manual temperature control, measure the voltage between the light sensor C2360-1, circuit VLF14 (BU/BN), harness side and ground.  N0057373 • **Is the voltage approximately 5 volts?**	**Yes** INSTALL a new light sensor. REFER to Light Sensor in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to G12 .
G12 CHECK CIRCUIT VLF14 (BU/BN) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: SJB C2280g. • On vehicles with EATC, measure the resistance between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.	**Yes** GO to G13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.



N0057374

- On vehicles with manual temperature control, measure the resistance between the light sensor C2360-1, circuit VLF14 (BU/BN), harness side and ground.



N0057375

- **Is the resistance greater than 10,000 ohms?**

G13 CHECK FOR CORRECT SJB OPERATION	

• Key in OFF position.
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB.
	REFER to Section 419-10 .
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
	CLEAR the DTCs.
	REPEAT the self-test.

Stoplamps

Printable View (165 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

The smart junction box (SJB) monitors the input from the stoplamp switch. When the brake pedal is applied, voltage is routed to the SJB and the high mounted stoplamp. The SJB then supplies voltage to the stoplamps.

Field-Effect Transistor (FET) Protection

The SJB utilizes a FET protective circuit strategy for many of its outputs (for example, the headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault is detected. A continuous DTC is stored at that time for the fault. The circuit will then reset after a customer demand of the function (switching the component on, 30-minute battery saver being energized). When an excessive circuit load occurs several times, the module shuts down the output until a repair procedure is carried out. At the same time, the continuous DTC that was stored on the first failure will not clear by a command to clear the continuous DTCs. The module will not allow this code to be cleared or the circuit restored to normal until a successful on-demand self-test proves that the fault has been repaired. After the on-demand self-test has successfully completed (no on-demand DTCs present), the continuous DTC will have been cleared and the circuit function will return.

The SJB FET protected output circuits for the stoplamp system are for the LH rear stop/turn lamp output and the RH rear stop/turn lamp output circuits.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Stoplamp switch	• Battery junction box (BJB) fuse 31 (15A) (stoplamp switch) • Smart junction box (SJB) fuse 6 (20A) (rear stoplamps) • Bulb(s) • Circuitry • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.

9. If the DTCs retrieved are related to the concern, go to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1485	Brake Pedal Input Short to Battery	Go To Pinpoint Test J .
B2044	Left Rear Stop Lamp Circuit Short to Ground	Go To Pinpoint Test I .

B2045	Left Rear Stop Lamp Circuit Open	If the lamp is inoperative, Go To Pinpoint Test I . If the lamp is always on, Go To Pinpoint Test J .
B2046	Right Rear Stop Lamp Circuit Short to Ground	Go To Pinpoint Test I .
B2047	Right Rear Stop Lamp Circuit Open	If the lamp is inoperative, Go To Pinpoint Test I . If the lamp is always on, Go To Pinpoint Test J .
All other DTCs	—	REFER to Section 419-10 .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Circuitry • SJB	• REFER to Section 418-00 .
• The stoplamps are inoperative	• Fuse • Circuitry • Stoplamp switch	• Go To Pinpoint Test H .
• One or more stoplamps are inoperative	• Circuitry • Trailer tow turn relay • High mounted stoplamp • SJB	• Go To Pinpoint Test I .

Pinpoint Tests

Pinpoint Test H: The Stoplamps Are Inoperative

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

The stoplamp switch is supplied voltage through circuit SBB31 (WH/RD) from the battery junction box (BJB). When the brake pedal is applied, the stoplamp switch routes voltage to the smart junction box (SJB) and the high mounted stoplamp through circuit CLS17 (YE/GY).

Possible Causes

- Fuse
- Circuit CLS17 (YE/GY) open
- Circuit SBB31 (WH/RD) open
- Stoplamp switch

PINPOINT TEST H: THE STOPLAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
H1 CHECK CIRCUIT SBB31 (WH/RD) FOR AN OPEN • Key in OFF position. • Disconnect: Stoplamp Switch C278. • Measure the voltage between the stoplamp switch C278-1, circuit SBB31 (WH/RD), harness side and ground.  N0038805 • **Is the voltage greater than 10 volts?**	**Yes** GO to H2 . **No** VERIFY the BJB fuse 31 (15A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.
H2 CHECK THE STOPLAMP SWITCH • Connect a fused (15A) jumper wire between the stoplamp switch C278-1, circuit SBB31 (WH/RD), harness side and the stoplamp switch C278-4, circuit CLS17 (YE/GY), harness side.  N0038807 • **Are the stoplamps illuminated?**	**Yes** INSTALL a new stoplamp switch. REFER to Stoplamp Switch in this section. TEST the system for normal operation. **No** REPAIR circuit CLS17 (YE/GY) for an open. TEST the system for normal operation.

Pinpoint Test I: One Or More Stoplamps Are Inoperative

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

When the brake pedal is applied, the stoplamp switch routes voltage to the smart junction box (SJB) and the high mounted stoplamp through circuit CLS17 (YE/GY). When the SJB detects the brake pedal applied, the SJB provides voltage to the LH and RH rear stoplamps, and the LH and RH trailer tow turn relays through circuits CLS18 (GY/BN) and CLS19 (VT/OG), respectively. Ground for the LH and RH rear stoplamps is provided through circuits GD149 (BK/GY) and GD151 (BK/GN), respectively. Ground for the high mounted stoplamp is provided through circuit GD150 (BK/WH).

DTC B2044 — is a continuous and on-demand DTC that sets when the SJB detects a short to ground on the LH rear stop/turn lamp voltage supply circuit.

DTC B2045 — is an on-demand DTC that sets when the SJB detects an open on the LH rear stop/turn lamp voltage supply circuit.

DTC B2046 — is a continuous and on-demand DTC that sets when the SJB detects a short to ground on the RH rear stop/turn lamp voltage supply circuit.

DTC B2047 — is an on-demand DTC that sets when the SJB detects an open on the RH rear stop/turn lamp voltage supply circuit.

Possible Causes

- Circuit CLS17 (YE/GY) open
- Circuit CLS18 (GY/BN) open or short to ground
- Circuit CLS19 (VT/OG) open or short to ground
- Circuit GD149 (BK/GY) open
- Circuit GD150 (BK/WH) open
- Circuit GD151 (BK/GN) open
- High mounted stoplamp
- Trailer tow turn relay
- SJB

PINPOINT TEST I: ONE OR MORE STOPLAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
I1 DETERMINE THE INOPERATIVE STOPLAMP	
• Key in OFF position. • Apply the brake pedal and observe the stoplamps. • **Is the high mounted stoplamp illuminated?**	**Yes** GO to I4 . **No** GO to I2 .
I2 CHECK CIRCUIT GD150 (BK/WH) FOR AN OPEN	
• Disconnect: High Mounted Stoplamp C475. • Measure the resistance between the high mounted stoplamp C475-2, circuit GD150 (BK/WH), harness side and ground.	**Yes** GO to I3 . **No** REPAIR the circuit. TEST the system for normal operation.

 N0037283 • **Is the resistance less than 5 ohms?**	
I3 CHECK CIRCUIT CLS17 (YE/GY) FOR AN OPEN (TO HIGH MOUNTED STOPLAMP)	
• While applying the brake pedal, measure the voltage between the high mounted stoplamp C475-1, circuit CLS17 (YE/GY), harness side and ground.  A0025385 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new high mounted stoplamp. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
I4 USE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB on-demand self-test. • **Were any DTCs present?**	**Yes** For DTCs B2044 or B2046, GO to I6 . For DTCs B2045 or B2047, GO to I8 . **No** GO to I5 .
I5 CHECK CIRCUIT CLS17 (YE/GY) FOR AN OPEN (TO SJB)	
• Disconnect: SJB C2280g. • While applying the brake pedal, measure the voltage between the SJB C2280g-40, circuit CLS17 (YE/GY), harness side and ground.  N0057391 • **Is the voltage greater than 10 volts?**	**Yes** GO to I8 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
I6 CHECK THE TRAILER TOW TURN RELAY	

• Disconnect: LH Trailer Tow Turn Relay (DTC B2044). • Disconnect: RH Trailer Tow Turn Relay (DTC B2046). • Key in ON position. • Repeat the SJB on-demand self-test. • **Is on-demand DTC B2044 or B2046 retrieved again?**	**Yes** GO to I7 . **No** INSTALL a new trailer tow turn relay. CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
I7 CHECK CIRCUIT CLS18 (GY/BN) OR CIRCUIT CLS19 (VT/OG) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: SJB C2280e. • Disconnect: Inoperative Stoplamp. • **NOTE:** For Navigator, both LH or both RH stoplamps must be disconnected for correct test results. • Measure the resistance between the SJB C2280e-25, circuit CLS18 (GY/BN), harness side and ground; or between the SJB C2280e-26, circuit CLS19 (VT/OG), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I10 . **No** REPAIR the circuit in question. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
I8 CHECK CIRCUIT GD149 (BK/GY) (LH STOPLAMP) OR CIRCUIT GD151 (BK/GN) (RH STOPLAMP) FOR AN OPEN	
• Disconnect: Inoperative Rear Lamp. • Measure the resistance between the inoperative rear lamp, harness side and ground as follows:	**Yes** GO to I9 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

Inoperative Stoplamp	Rear Lamp Connector-Pin	Circuit
Expedition		
LH rear	C4035-1	GD149 (BK/GY)
RH rear	C4032-1	GD151 (BK/GN)
Navigator		
LH rear	C4112-1	GD149 (BK/GY)
LH rear	C4113-1	GD149 (BK/GY)
RH rear	C4114-1	GD151 (BK/GN)
RH rear	C4115-1	GD151 (BK/GN)

<table>
<tr><td>

- **Is the resistance less than 5 ohms?**

</td><td></td></tr>
<tr><td>

I9 CHECK THE CIRCUIT CLS18 (GY/BN) OR CIRCUIT CLS19 (VT/OG) FOR AN OPEN

</td><td></td></tr>
<tr><td>

- Disconnect: SJB C2280e.
- Measure the resistance between the inoperative rear lamp, harness side and the SJB, harness side; and between the inoperative rear lamp, harness side and ground as follows:

Inoperative Stoplamp Connector-Pin	SJB Connector-Pin	Circuit
Expedition		
LH rear C4035-3	C2280e-25	CLS18 (GY/BN)
RH rear C4032-3	C2280e-26	CLS19 (VT/OG)
Navigator

<tr><td>

I10 CHECK FOR CORRECT SJB OPERATION

</td><td></td></tr>
<tr><td>

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

</td><td>

Yes
INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

</td></tr>
</table>

Pinpoint Test J: The Stoplamps Are On Continuously

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

When the brake pedal is applied, the stoplamp switch routes voltage to the smart junction box (SJB) and the high mounted stoplamp, the powertrain control module (PCM), the anti-lock brake system (ABS) module and the trailer electric brake controller through circuit CLS17 (YE/GY). When the SJB detects the brake pedal applied, the SJB provides voltage to the LH and RH rear stoplamps, and the LH and RH trailer tow turn relays through circuits CLS18 (GY/BN) and CLS19 (VT/OG), respectively.

DTC B1485 — is an on-demand DTC that sets when the SJB detects a short to voltage from the stoplamp switch input circuit.

DTC B2045 — is an on-demand DTC that sets when the SJB detects a short to voltage on the LH rear stop/turn lamp voltage supply circuit.

DTC B2047 — is an on-demand DTC that sets when the SJB detects a short to voltage on the RH rear stop/turn lamp voltage supply circuit.

Possible Causes

- Circuit CCB08 (VT/WH) short to voltage
- Circuit CLS17 (YE/GY) short to voltage
- Circuit CLS18 (GY/BN) short to voltage
- Circuit CLS19 (VT/OG) short to voltage
- Stoplamp switch
- Trailer electric brake controller
- ABS module
- PCM
- SJB

PINPOINT TEST J: THE STOPLAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
J1 DETERMINE IF ALL THE STOPLAMPS ARE ILLUMINATED	
• Key in OFF position. • Observe the stoplamps with the brake pedal released. • **Are all of the stoplamps illuminated?**	**Yes** GO to J3 . **No** GO to J2 .
J2 CHECK THE STOPLAMPS VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280e. • **Do the stoplamps continue to illuminate?**	**Yes** If the LH rear lamp continues to illuminate, REPAIR circuit CLS18 (GY/BN). CLEAR the DTCs. REPEAT the self-test. If the RH rear lamp continues to illuminate, REPAIR circuit CLS19 (VT/OG). CLEAR the DTCs. REPEAT the self-test. **No** GO to J10 .
J3 CHECK THE STOPLAMP SWITCH	
• Disconnect: Stoplamp Switch C278. • **Do the stoplamps continue to illuminate?**	**Yes** If the vehicle is equipped with a trailer electric brake controller, GO to J4 . If the vehicle is not equipped with a trailer electric brake controller, GO to J5 . **No** INSTALL a new stoplamp switch. REFER to Stoplamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.
J4 CHECK THE TRAILER ELECTRIC BRAKE CONTROLLER	

• Disconnect: Trailer Electric Brake Controller C2142. • **Do the stoplamps continue to illuminate?**	**Yes** GO to J5 . **No** INSTALL a new trailer electric brake controller. CLEAR the DTCs. REPEAT the self-test.
J5 CHECK THE PCM	
• Disconnect: PCM C175b. • **Do the stoplamps continue to illuminate?**	**Yes** GO to J6 . **No** GO to J8 .
J6 CHECK THE ABS MODULE	
• Disconnect: ABS Module C135. • **Do the stoplamps continue to illuminate?**	**Yes** GO to J7 . **No** GO to J9 .
J7 CHECK CIRCUIT CLS17 (YE/GY) FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280e. • **Does the high mounted stoplamp continue to illuminate?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to J10 .
J8 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

J9 CHECK FOR CORRECT ABS MODULE OPERATION	

• Disconnect the ABS module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the ABS module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

J10 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.

■ pushed-out pins ● Connect all the SJB connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Turn Signal and Hazard Lamps

Printable View (181 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

The smart junction box (SJB) monitors the multifunction switch position by sending multiple voltage reference signals to the multifunction switch. When the multifunction switch is in the LH or RH TURN positions, or the hazard lamp switch is pressed, that input signal is routed to ground.

When the SJB receives a request for a turn signal or hazard lamps, the SJB supplies voltage to the appropriate turn lamps.

The timed on/off cycle is determined by the SJB and is set to flash approximately 80 times per minute if both the front and rear turn lamps operate correctly. If an individual turn signal lamp is inoperative, the SJB flashes the remaining turn lamp approximately 160 times per minute.

Field-Effect Transistor (FET) Protection

The SJB utilizes a FET protective circuit strategy for many of its outputs (for example, the headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault is detected. A continuous DTC is stored at that time for the fault. The circuit will then reset after a customer demand of the function (switching the component on, 30-minute battery saver being energized). When an excessive circuit load occurs several times, the module shuts down the output until a repair procedure is carried out. At the same time, the continuous DTC that was stored on the first failure will not clear by a command to clear the continuous DTCs. The module will not allow this code to be cleared or the circuit restored to normal until a successful on-demand self-test proves that the fault has been repaired. After the on-demand self-test has successfully completed (no on-demand DTCs present), the continuous DTC will have been cleared and the circuit function will return.

The SJB FET protected output circuits for the turn lamp system are for the LH front turn lamp output and

the RH front turn lamp output circuits. The rear turn lamps utilize the stoplamp circuitry and are also protected. For additional information regarding the rear lamps, refer to Stoplamps in this section.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Multifunction switch • Hazard flasher lamp switch	• Smart junction box (SJB) • Circuitry • Bulbs

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.

9. If the DTCs retrieved are related to the concern, go to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B2A27	Right Front Turn Lamp Circuit Open	Go To Pinpoint Test M .
B2A28	Right Front Turn Lamp Circuit Short to Ground	Go To Pinpoint Test M .
B2A29	Left Front Turn Lamp Circuit Open	Go To Pinpoint Test M .
B2A2A	Left Front Turn Lamp Circuit Short to Ground	Go To Pinpoint Test M .
B2071	Hazard Switch Signal Short to Ground	Go To Pinpoint Test N .
B2281	Right Turn Switch Short to Ground	Go To Pinpoint Test L .
B2282	Left Turn Switch Short to Ground	Go To Pinpoint Test L .
All other DTCs	—	REFER to Section 419-10 .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Circuitry • SJB	• REFER to Section 418-00 .
• The turn signal lamps are inoperative	• Circuitry • Multifunction switch • SJB	• Go To Pinpoint Test K .
• The turn signal lamps are always on	• Circuitry • Multifunction switch • SJB	• Go To Pinpoint Test L .
• One turn signal/hazard lamp is inoperative/always on	• Circuitry • Signal mirror • SJB	• Go To Pinpoint Test M .
• The hazard lamps are inoperative/always on	• Circuitry • Hazard flasher lamp switch • SJB	• Go To Pinpoint Test N .

Pinpoint Tests

Pinpoint Test K: The Turn Signal Lamps Are Inoperative

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends reference signals to the multifunction switch through circuits CLS20 (BN/BU) (LH turn input) and CLS24 (BN/WH) (RH turn input). When the multifunction switch is placed in

the LH or RH TURN positions, the voltage signal is routed to ground. When the SJB detects the multifunction switch in the LH or RH TURN position, the SJB provides voltage to the appropriate turn lamps.

Possible Causes

- Circuit CLS20 (BN/BU) open
- Circuit CLS24 (BN/WH) open
- Multifunction switch
- SJB

PINPOINT TEST K: THE TURN SIGNAL LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
K1 CHECK FOR CORRECT HIGH BEAM OPERATION • Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the HIGH BEAM position while observing the high beam headlamps. • **Do the high beams operate correctly?**	**Yes** PLACE the headlamp switch in the OFF position. GO to K2 . **No** REFER to Headlamps in this section.
K2 CHECK THE MULTIFUNCTION SWITCH • Key in OFF position. • Disconnect: Multifunction Switch C202. • Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the multifunction switch OK?**	**Yes** GO to K3 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.
K3 CHECK CIRCUIT CLS20 (BN/BU) (LH TURN SIGNAL) OR CLS24 (BN/WH) (RH TURN SIGNAL) FOR AN OPEN • Disconnect: SJB C2280g. • Measure the resistance between the multifunction switch C202-2 (LH turn lamps), circuit CLS20 (BN/BU), harness side and the SJB C2280g-42, circuit CLS20 (BN/BU), harness side; or between the multifunction switch C202-3 (RH turn lamps), circuit CLS24 (BN/WH), harness side and the SJB C2280g-29, circuit CLS24 (BN/WH), harness side.	**Yes** GO to K4 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 N0057393 • **Is the resistance less than 5 ohms?**	

K4 CHECK FOR CORRECT SJB OPERATION
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test L: The Turn Signal Lamps Are Always On

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends reference signals to the multifunction switch through circuits CLS20 (BN/BU) (LH turn input) and CLS24 (BN/WH) (RH turn input). When the multifunction switch is placed in the LH or RH TURN positions, the voltage signal is routed to ground. When the SJB detects the multifunction switch in the LH or RH TURN position, the SJB provides voltage to the appropriate turn lamps.

DTC B2281 — is an on-demand DTC that sets when the SJB detects the RH turn signal switch input is short to ground.

DTC B2282 — is an on-demand DTC that sets when the SJB detects the LH turn signal switch input is short to ground.

Possible Causes

- Circuit CLS20 (BN/BU) short to ground
- Circuit CLS24 (BN/WH) short to ground
- Multifunction switch
- SJB

PINPOINT TEST L: THE TURN SIGNAL LAMPS ARE ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
L1 CHECK THE MULTIFUNCTION SWITCH	
• Key in OFF position. • Disconnect: Multifunction Switch C202. • Key in ON position. • **Do the turn lamps continue to flash on and off?**	**Yes** GO to L2 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test.
L2 CHECK CIRCUIT CLS20 (BN/BU) (LH TURN SIGNAL) OR CIRCUIT CLS24 (BN/WH) (RH TURN SIGNAL) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: SJB C2280g. • Measure the resistance between the multifunction switch C202-2 (LH turn lamps), circuit CLS20 (BN/BU), harness side and ground; or between the multifunction switch C202-3 (RH turn lamps), circuit CLS24 (BN/WH), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to L3 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
L3 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Pinpoint Test M: One Turn Signal/Hazard Lamp Is Inoperative/Always On

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

When the smart junction box (SJB) detects the multifunction switch in the LH TURN position, the SJB provides voltage through circuit CLS21 (BU/GN) to the LH front turn lamp and the signal mirror (if equipped). When the SJB detects the multifunction switch in the RH TURN position, the SJB provides voltage through circuit CLS25 (YE/VT) to the RH front turn lamp and the signal mirror (if equipped). Circuits GD123 (BK/GY) and GD120 (BK/GN) provide ground for the LH and RH front turn lamps, respectively. Circuits GD143 (BK/VT) and GD138 (BK/WH) provide ground for the LH and RH signal mirrors, respectively. The rear turn lamps are controlled utilizing the rear stoplamp circuitry.

DTC B2A27 — is an on-demand DTC that sets when the SJB detects an open or short to voltage on the RH front turn lamp voltage supply circuit.

DTC B2A28 — is a continuous and on-demand DTC that sets when the SJB detects a short to ground on the RH front turn lamp voltage supply circuit.

DTC B2A29 — is an on-demand DTC that sets when the SJB detects an open or short to voltage on the LH front turn lamp voltage supply circuit.

DTC B2A2A — is a continuous and on-demand DTC that sets when the SJB detects a short to ground on the LH front turn lamp voltage supply circuit.

Possible Causes

- Circuit CLS21 (BU/GN) open, short to ground or voltage
- Circuit CLS25 (YE/VT) open, short to ground or voltage
- Circuit GD120 (BK/GN) open
- Circuit GD123 (BK/GY) open
- Circuit GD138 (BK/WH) open
- Circuit GD143 (BK/VT) open
- Signal mirror
- SJB

PINPOINT TEST M: ONE TURN SIGNAL/HAZARD LAMP IS INOPERATIVE/ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
M1 CHECK THE STOPLAMPS	
• Apply and release the brake pedal while observing the stoplamps. • **Do the stoplamps operate correctly?**	**Yes** GO to M2 . **No** REFER to Stoplamps in this section.
M2 DETERMINE IF A TURN LAMP IS ALWAYS ON	
• Key in ON position. • Monitor the turn lamps while placing the multifunction switch in the RH TURN and then LH TURN positions. • **Is any turn lamp always on?**	**Yes** GO to M3 . **No** GO to M4 .
M3 CHECK CIRCUIT CLS21 (BU/GN) (LH TURN) OR CIRCUIT CLS25 (YE/VT) (RH TURN) FOR A SHORT TO VOLTAGE	

• Key in OFF position. • Disconnect: SJB C2280b. • Key in ON position. • **Does the turn lamp in question continue to illuminate?**	**Yes** For the LH turn lamp, REPAIR circuit CLS21 (BU/GN). CLEAR the DTCs. REPEAT the self-test. For the RH turn lamp, REPAIR circuit CLS25 (YE/VT). CLEAR the DTCs. REPEAT the self-test. **No** GO to M9 .
M4 USE THE RECORDED DTCs FROM THE SJB SELF-TEST • Check the recorded results from the SJB on-demand self-test. • **Was DTC B2A28 or B2A2A present?**	**Yes** If equipped with signal mirrors, GO to M5 . If not equipped with signal mirrors, GO to M6 . **No** GO to M7 .
M5 CHECK THE SIGNAL MIRROR (SHORT TO GROUND) • Key in OFF position. • Disconnect: LH Signal Mirror C622 (DTC B2A2A). • Disconnect: RH Signal Mirror C516 (DTC B2A28). • Key in ON position. • Repeat the SJB on-demand self-test. • **Is on-demand DTC B2A2A or B2A28 retrieved again?**	**Yes** GO to M6 . **No** INSTALL a new signal mirror in question. CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
M6 CHECK CIRCUIT CLS21 (BU/GN) (DTC B2A2A) OR CIRCUIT CLS25 (YE/VT) (DTC B2A28) FOR A SHORT TO GROUND • Key in OFF position. • Disconnect: Inoperative Front Turn Lamp. • Disconnect: SJB C2280b. • Measure the resistance between the SJB C2280b-21 (DTC B2A2A), circuit CLS21 (BU/GN), harness side and ground; or between the SJB C2280b-23 (DTC B2A28), circuit CLS25 (YE/VT), harness side and ground.  N0058672 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M9 . **No** REPAIR the circuit in question. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
M7 CHECK THE GROUND CIRCUIT FOR AN OPEN • Key in OFF position. • Disconnect: Inoperative Turn Lamp.	**Yes** GO to M8 .

- Measure the resistance between the inoperative turn lamp, harness side and ground as follows

Inoperative Turn Lamp	Connector-Pin	Circuit
LH front (Expedition)	C1023-1	GD123 (BK/GY)
RH front (Expedition)	C1043-1	GD120 (BK/GN)
LH front (Navigator)	C156-1	GD123 (BK/GY)
RH front (Navigator)	C166-1	GD120 (BK/GN)
LH signal mirror	C516-2	GD143 (BK/VT)
RH signal mirror	C622-2	GD138 (BK/WH)

- **Is the resistance less than 5 ohms?**

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test

M8 CHECK CIRCUIT CLS21 (BU/GN) (LH TURN) OR CIRCUIT CLS25 (YE/VT) (RH TURN) FOR AN OPEN

- Disconnect: SJB C2280b.
- **NOTE:** If the signal mirror and the corresponding front turn lamp are both inoperative, follow the checks and directions for the front turn lamp.
- Measure the resistance between the inoperative turn lamp, harness side and the SJB, harness side as follows:

Inoperative Turn Lamp Connector-Pin	SJB Connector-Pin	Circuit
LH front (Expedition) C1023-3	C2280b-21	CLS21 (BU/GN)
RH front (Expedition) C1043-3	C2280b-23	CLS25 (YE/VT)
LH front (Navigator) C156-3	C2280b-21	CLS21 (BU/GN)
RH front (Navigator) C166-3	C2280b-23	CLS25 (YE/VT)
LH signal mirror C516-10	C2280b-21	CLS21 (BU/GN)
RH signal mirror C622-10	C2280b-23	CLS25 (YE/VT)

- **Is the resistance less than 5 ohms?**

Yes
For a signal mirror, INSTALL a new signal mirror. REFER to Side Turn Signal Lamp — Signal Mirror in this section.

For a front turn lamp, GO to M9 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test

M9 CHECK FOR CORRECT SJB OPERATION

- Key in OFF position.
- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test N: The Hazard Lamps Are Inoperative/Always On

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a voltage reference signal to the hazard flasher lamp switch through circuit CLN30 (GN/OG). When the hazard flasher lamp switch is pressed, the voltage signal is routed to ground through circuit GD138 (BK/WH). When the SJB detects a request for the hazard lamps, the SJB provides voltage to the appropriate turn lamps.

The hazard flasher lamp switch is a momentary contact switch.

DTC B2071 — is an on-demand DTC that sets when the SJB detects a short to ground from the hazard flasher lamp switch input circuit.

Possible Causes

- Circuit CLN30 (GN/OG) open or short to ground
- Circuit GD138 (BK/WH) open
- Hazard flasher lamp switch
- SJB

PINPOINT TEST N: THE HAZARD LAMPS ARE INOPERATIVE/ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
N1 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Key in OFF position. • Disconnect: Hazard Flasher Lamp Switch C2361. • Measure the resistance between the hazard lamp switch C2361-4, circuit GD138 (BK/WH), harness side and ground.  N0058673 • **Is the resistance less than 5 ohms?**	**Yes** GO to N2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
N2 CHECK CIRCUIT CLN30 (GN/OG) FOR A SHORT TO GROUND	
• Disconnect: SJB C2280g. • Measure the resistance between the hazard lamp switch C2361-8, circuit CLN30 (GN/OG), harness side and ground.	**Yes** GO to N3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-

 N0058674 • **Is the resistance greater than 10,000 ohms?**	test.
N3 CHECK CIRCUIT CLN30 (GN/OG) FOR AN OPEN	
• Measure the resistance between the SJB C2280g-48, circuit CLN30 (GN/OG), harness side and the hazard flasher lamp switch C2361-8, circuit CLN30 (GN/OG), harness side.  N0058675 • **Is the resistance less than 5 ohms?**	**Yes** GO to N4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test..
N4 CHECK THE HAZARD FLASHER LAMP SWITCH	
• Connect: Hazard Lamp Switch C2341. • While pressing and releasing the hazard flasher lamp switch, measure the resistance between the SJB C2280g-48, circuit CLN30 (GN/OG), harness side and ground.  N0058676 • **Is the resistance less than 5 ohms with the switch pressed and greater than 10,000 ohms with the switch released?**	**Yes** GO to N5 . **No** INSTALL a new hazard flasher lamp switch. REFER to Hazard Flasher Lamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.
N5 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been

	caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Parking, Rear and License Plate Lamps

Printable View (135 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

The smart junction box (SJB) monitors the headlamp switch position by sending voltage reference signals on multiple circuits to the headlamp switch. At any given time, one of the signal circuits is routed to ground. If the SJB does not detect any of the inputs to the headlamp switch is active (routed to ground) for 5 seconds, the SJB turns on the exterior lights and keeps them on for 10 minutes after the ignition switch is turned off (or 10 minutes from the time the SJB does not detect any headlamp switch input if the ignition switch was already off). If the SJB detects multiple circuits short to ground, the SJB implements a planned strategy depending on the multiple inputs received. If either of these situations occur, the SJB should **NOT** be ruled immediately as being at fault. This is normal behavior of the SJB design as it has detected a fault with the inputs from the headlamp switch.

When the SJB receives an input from the headlamp switch indicating a request for the parking lamps, the SJB energizes the parking lamp relay, which supplies voltage to the exterior lamps.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch	• Smart junction box (SJB) fuse 22 (15A) (parking lamps) • SJB • Bulb(s) • Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.

9. If the DTCs retrieved are related to the concern, go to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1578	Lamp Park Input Circuit Short to Ground	Go To Pinpoint Test P .
All other DTCs	—	REFER to Section 419-10 .

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Circuitry • SJB	• REFER to Section 418-00 .
• One or more parking, rear or license plate lamps is inoperative	• Fuse • Circuitry • SJB	• Go To Pinpoint Test O .
• The parking, rear or license plate lamps are on continuously	• Circuitry • Headlamp switch • SJB	• Go To Pinpoint Test P .

Pinpoint Tests

Pinpoint Test O: One Or More Parking, Rear or License Plate Lamps Is Inoperative

Refer to Wiring Diagrams Cell 92 , Parking, Rear and License Lamps for schematic and connector information.

Normal Operation

When the headlamp switch is placed in the PARKING LAMPS ON position, the smart junction box (SJB) provides a ground for the parking lamp relay coil (integral to the SJB). When the parking lamp relay is energized, voltage is routed through circuit CLS30 (VT/WH) to the rear and front parking lamps. Ground is provided to the rear parking, liftgate and license plate lamps through circuit GD149 (BK/GY), circuit GD150 (BK/WH) or circuit GD151 (BK/GN). Ground is provided to the front parking and side marker lamps through circuit GD120 (BK/GN) or circuit GD123 (BK/GY).

Possible Causes

- Fuse
- Circuit CLS30 (VT/WH) open
- Circuit GD120 (BK/GN) open
- Circuit GD123 (BK/GY) open
- Circuit GD149 (BK/GY) open
- Circuit GD150 (BK/WH) open
- Circuit GD151 (BK/GN) open
- SJB

PINPOINT TEST O: ONE OR MORE PARKING, REAR OR LICENSE PLATE LAMPS IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
O1 DETERMINE IF ALL THE PARKING LAMPS ARE INOPERATIVE	
• Key in OFF position.	**Yes**

• Place the headlamp switch to the PARKING LAMPS ON position. • **Are all the parking lamps inoperative?**	PLACE the headlamp switch in the OFF position. VERIFY the SJB fuse 22 (15A) is OK. If OK, GO to O5 . **No** If all the front parking lamps are inoperative, GO to O2 . If all the rear parking and license plate lamps are inoperative, GO to O3 . For all others, GO to O4 .
O2 CHECK CIRCUIT CLS30 (VT/WH) FOR AN OPEN (FRONT LAMPS)	
• Disconnect: SJB C2280a. • Connect a fused (10A) jumper wire between the SJB C2280a-1, circuit CBB69 (WH/VT), harness side and the SJB C2280a-6, circuit CLS30 (VT/WH), harness side.  N0058677 • Key in ON position. • **Do the front parking lamps illuminate?**	**Yes** REMOVE the jumper wire. GO to O5 . **No** REPAIR the circuit. TEST the system for normal operation.
O3 CHECK CIRCUIT CLS30 (VT/WH) FOR AN OPEN (REAR LAMPS)	
• Disconnect: SJB C2280e. • Connect a fused (10A) jumper wire between the positive battery terminal and the SJB C2280e-20, circuit CLS30 (VT/WH), harness side.  N0058678 • **Do the rear parking lamps illuminate?**	**Yes** REMOVE the jumper wire. GO to O5 . **No** REPAIR the circuit. TEST the system for normal operation.
O4 CHECK THE PARKING LAMP GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Inoperative Lamp. • Measure the resistance between the inoperative lamp, harness side and ground as follows:	**Yes** REPAIR circuit CLS30 (VT/WH) for an open. TEST the system for

- **Is the resistance less than 5 ohms?**

normal operation.

No
REPAIR the ground circuit in question. TEST the system for normal operation.

O5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test P: The Parking, Rear Or License Plate Lamps Are On Continuously

Refer to Wiring Diagrams Cell 92 , Parking, Rear and License Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) monitors the parking lamp request input from the headlamp switch through circuit CLS05 (BU/GY). The SJB provides a ground for the parking lamp relay coil (integral to the SJB) when a request for the parking lamps is received. When the parking lamp relay is energized, voltage is routed through circuit CLS30 (VT/WH) to the rear and front parking lamps.

DTC B1578 — is an on-demand DTC that sets when the SJB detects a short to ground in the parking lamps on input circuit.

Possible Causes

- Circuit CLS30 (VT/WH) short to voltage
- Circuit CLS05 (BU/GY) short to ground
- Headlamp switch
- SJB

PINPOINT TEST P: THE PARKING, REAR OR LICENSE PLATE LAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
P1 USE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB self-test. • **Was DTC B1578 recorded?**	**Yes** GO to P2 . **No** GO to P4 .
P2 CHECK THE HEADLAMP SWITCH	
• Key in OFF position. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** GO to P3 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.
P3 CHECK CIRCUIT CLS05 (BU/GY) FOR A SHORT TO GROUND	
• Disconnect: SJB C2280g. • Measure the resistance between the headlamp switch C205-5, circuit CLS05 (BU/GY), harness side and ground.	**Yes** GO to P6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0058679 • **Is the resistance greater than 10,000 ohms?**	
P4 CHECK CIRCUIT CLS30 (VT/WH) FOR A SHORT TO VOLTAGE (TO REAR LAMPS)	
• Key in OFF position. • Disconnect: SJB C2280e. • Key in ON position. • **Do the rear parking lamps continue to illuminate?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to P5 .
P5 CHECK CIRCUIT CLS30 (VT/WH) FOR A SHORT TO VOLTAGE (TO FRONT LAMPS)	
• Key in OFF position. • Disconnect: SJB C2280a. • Key in ON position. • **Do the front parking lamps continue to illuminate?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to P6 .
P6 CHECK FOR CORRECT SJB OPERATION	

• Key in OFF position.
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Fog Lamps

Printable View (157 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

The smart junction box (SJB) monitors the headlamp switch position by sending a voltage reference signal to the headlamp switch. When the fog lamp switch is engaged, the voltage reference signal is routed to ground.

The fog lamps can be turned on when the following conditions are met:

- The ignition switch is in the RUN or START position.
- The low beam headlamps or the parking lamps are on.
- The high beams are off.

When the SJB receives an input from the headlamp switch indicating a request for the fog lamps, the SJB provides voltage to the fog lamp relay. When the fog lamp relay is energized, voltage is routed to the fog lamps.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Smart junction box (SJB) fuse 21 (15A) (fog lamps) • Circuity • Bulb(s) • Headlamp switch • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.

9. If the DTCs retrieved are related to the concern, go to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B2254	Front Fog Lamp Switch Failure	Go To Pinpoint Test S .
All other DTCs	—	REFER to Section 419-10 .

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Circuitry • SJB	• REFER to Section 418-00 .
• The fog lamps are inoperative	• Fuse • Circuitry • Headlamp switch • SJB	• Go To Pinpoint Test Q .
• An individual fog lamp is inoperative	• Circuitry	• **NOTE:** Make sure the fog lamp bulb is OK before carrying out diagnostics. Go To Pinpoint Test R .
• The fog lamps are on continuously	• Circuitry • Headlamp switch • SJB	• Go To Pinpoint Test S .
• The fog lamps on indicator is inoperative	• Circuitry • Headlamp switch • SJB	• Go To Pinpoint Test T .

Pinpoint Tests

Pinpoint Test Q: The Fog Lamps Are Inoperative

Refer to Wiring Diagrams Cell 86 , Fog Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a reference signal to the headlamp switch through circuit CLF29 (BN) to monitor the fog lamp request. When the fog lamp switch is engaged, the voltage signal is routed to ground.

When the SJB detects the fog lamps on request, the SJB provides ground to the fog lamp relay coil (integral to the SJB). When the fog lamp relay is energized, voltage is routed through circuit CLF21 (GY/VT) to the fog lamps.

Possible Causes

- Fuse
- Circuit CLF21 (GY/VT) open
- Circuit CLF29 (BN) open
- Headlamp switch
- SJB

PINPOINT TEST Q: THE FOG LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
Q1 CHECK THE HEADLAMP SWITCH PID • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: SJB Headlamp Switch PID. • Monitor the SJB FOG SW PID while engaging the fog lamp switch. • **Does the PID indicate the fog lamp switch is active?**	**Yes** GO to Q4 . **No** GO to Q2 .
Q2 CHECK THE HEADLAMP SWITCH • Key in OFF position. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** GO to Q3 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.
Q3 CHECK CIRCUIT CLF29 (BN) FOR AN OPEN • Disconnect: SJB C2280g. • Measure the resistance between the headlamp switch C205-6, circuit CLF29 (BN), harness side and the SJB C2280g-49, circuit CLF29 (BN), harness side.  N0058680 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q5 . **No** REPAIR the circuit. TEST the system for normal operation.
Q4 CHECK CIRCUIT CLF21 (GY/VT) FOR AN OPEN • Key in OFF position. • Connect a fused (15A) jumper wire between the SJB C2280a-1, circuit CBB69 (WH/VT), harness side and the SJB C2280a-3, circuit CLF21 (GY/VT), harness side.  N0058681 • Key in ON position. • **Do the fog lamps illuminate?**	**Yes** REMOVE the jumper wire. VERIFY the SJB fuse 21 (15A) is OK. If OK, GO to Q5 . **No** REPAIR the circuit. TEST the system for normal operation.

Q5 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test R: An Individual Fog Lamp Is Inoperative

Refer to Wiring Diagrams Cell 86 , Fog Lamps for schematic and connector information.

Normal Operation

When the fog lamp relay is energized, voltage is routed through circuit CLF21 (GY/VT) to the fog lamps. Ground is provided on circuits GD120 (BK/GN) and GD123 (BK/GY) to the LH and RH fog lamps, respectively.

Possible Causes

- Circuit CLF21 (GY/VT) open
- Circuit GD120 (BK/GN) open
- Circuit GD123 (BK/GY) open

PINPOINT TEST R: AN INDIVIDUAL FOG LAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>R1 CHECK THE GROUND CIRCUIT FOR AN OPEN</td><td></td></tr>
<tr><td>• Key in OFF position.
• Disconnect: Inoperative Fog Lamp.
• Measure the resistance between the inoperative fog lamp, harness side and ground as follows:

<table>
<tr><th>Inoperative Fog Lamp</th><th>Connector-Pin</th><th>Circuit</th></tr>
<tr><td colspan="3">Expedition</td></tr>
<tr><td>LH</td><td>C152-1</td><td>GD120 (BK/GN</td></tr>
<tr><td>RH</td><td>C162-1</td><td>GD123 (BK/GY</td></tr>

</table>
</td><td>Yes
REPAIR circuit CLF21 (GY/VT) for an open. TEST the system for normal operation.

No
REPAIR the ground circuit in question for an open. TEST the system for normal operation.</td></tr>
</table>

RH	C1323-A	GD123 (BK/GY

- **Is the resistance less than 5 ohms?**

Pinpoint Test S: The Fog Lamps Are On Continuously

Refer to Wiring Diagrams Cell 86 , Fog Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a reference signal to the headlamp switch through circuit CLF29 (BN) to monitor the fog lamp request. When the fog lamp switch is engaged, the voltage signal is routed to ground.

When the SJB detects the fog lamps on request, the SJB provides ground to the fog lamp relay coil (integral to the SJB). When the fog lamp relay is energized, voltage is routed through circuit CLF21 (GY/VT) to the fog lamps and to circuit CLF28 (BN/WH) to the headlamp switch for the fog lamps on indicator.

DTC B2254 — is an on-demand DTC that sets when the SJB detects a short to ground on the fog lamp on input circuit.

Possible Causes

- Circuit CLF21 (GY/VT) short to voltage
- Circuit CLF28 (BN/WH) short to voltage
- Circuit CLF29 (BN) short to ground
- Headlamp switch
- SJB

PINPOINT TEST S: THE FOG LAMPS ARE ON CONTINUOUSLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
S1 CHECK FOR RECORDED SJB DTCs	
• Check the recorded results from the SJB self-test. • **Is DTC B2254 present?**	**Yes** GO to S2 . **No** GO to S4 .
S2 CHECK THE HEADLAMP SWITCH	
• Key in OFF position. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** GO to S3 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.

S3 CHECK CIRCUIT CLF29 (BN) FOR A SHORT TO GROUND	
• Disconnect: SJB C2280h. • Measure the resistance between the headlamp switch C205-6, circuit CLF29 (BN), harness side and ground.  N0037299 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
S4 CHECK CIRCUIT CLF28 (BN/WH) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: SJB C2280f. • Key in ON position. • **Do the fog lamps continue to illuminate?**	**Yes** GO to S5 . **No** REPAIR the circuit. TEST the system for normal operation.
S5 CHECK CIRCUIT CLF21 (GY/VT) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: SJB C2280a. • Key in ON position. • **Do the fog lamps continue to illuminate?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to S6 .
S6 CHECK FOR CORRECT SJB OPERATION	

• Key in OFF position.
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Pinpoint Test T: The Fog Lamps On indicator Is Inoperative

Refer to Wiring Diagrams Cell 86 , Fog Lamps for schematic and connector information.

Normal Operation

When the smart junction box (SJB) detects the fog lamps on request, the SJB provides ground to the fog lamp relay coil (integral to the SJB). When the fog lamp relay is energized, voltage is routed through circuit CLF21 (GY/VT) to the fog lamps and to circuit CLF28 (BN/WH) to the headlamp switch for the fog lamps on indicator.

Possible Causes

- Circuit CLF28 (BN/WH) open
- Headlamp switch
- SJB

PINPOINT TEST T: THE FOG LAMPS ON INDICATOR IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
T1 CHECK THE HEADLAMP SWITCH **NOTE:** Make sure the headlamp switch is in the OFF position. • Key in OFF position. • Disconnect: Headlamp Switch C205. • Connect a fused (5A) jumper wire between the headlamp switch C205-6, circuit CLF29 (BN), harness side and ground.  N0058682 • Key in ON position. • **NOTE:** Make sure the fog lamps are illuminated when taking a reading. • Measure the voltage between the headlamp switch C205-3, circuit CLF28 (BN/WH), harness side and ground.  N0058683 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to T2.
T2 CHECK CIRCUIT CLF28 (BN/WH) FOR AN OPEN • Key in OFF position. • Disconnect: SJB C2280f. • Measure the resistance between the headlamp switch C205-3, circuit CLF28 (BN/WH), harness side and the SJB C2280f-6, circuit CLF28 (BN/WH), harness side.	**Yes** GO to T3. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0058684 • **Is the resistance greater than 10,000 ohms?**	

T3 CHECK FOR CORRECT SJB OPERATION
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Reversing Lamps

Printable View (175 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

For vehicles equipped with an automatic transmission, the transmission control module (TCM) sends gear status information to the instrument cluster over the communication network. The smart junction box (SJB) receives transmission gear status from the instrument cluster over the communication network. When a message is sent over the communication network stating the transmission is in REVERSE (R), the SJB energizes an internal relay which supplies voltage to the reversing lamps.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Battery junction box (BJB) fuse 33 (20A) • Transmission control module (TCM) • Bulb(s) • Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the TCM.

9. If the DTCs retrieved are related to the concern, refer to the Transmission Control Module (TCM) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Transmission Control Module (TCM) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
P1910	Reverse Lamp Control Circuit/Open	Go To Pinpoint Test U .
P1911	Reverse Lamp Control Circuit Low	Go To Pinpoint Test U .
P1912	Reverse Lamp Control Circuit High	Go To Pinpoint Test W .
All other DTCs	—	REFER to Section 307-01A or Section 307-01B .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Circuitry • SJB	• REFER to Section 418-00 .

• The reversing lamps are inoperative	• Fuse • Circuitry • Battery junction box (BJB) • Reversing lamp relay • Transmission control module (TCM)	• Go To Pinpoint Test U .

Pinpoint Tests

Pinpoint Test U: The Reversing Lamps Are Inoperative

Refer to Wiring Diagrams Cell 93 , Reversing Lamps for schematic and connector information.

Normal Operation

Voltage is supplied from the battery junction box (BJB) fuse 33 (20A) to the switched side of the reversing lamps relay. The reversing lamps relay coil power is supplied by the transmission control module (TCM) (also called a main control valve body for Expedition and a mechatronic assembly for Navigator) through circuit CAT03 (GY/BN). The reversing lamps relay coil ground is controlled by the TCM through circuit RET24 (BN/BU). When the reversing lamps relay is energized, voltage is routed to the reversing lamps through circuit CLS10 (GN/BN).

DTC P1910 — sets when the TCM detects an open from the reversing lamps relay coil voltage supply circuit.

DTC P1911 — sets when the TCM detects a short to ground from the reversing lamps relay coil voltage supply circuit.

Possible Causes

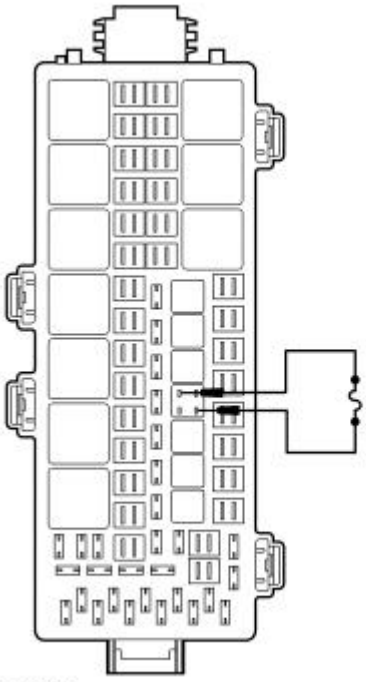
- Fuse
- Circuit CAT03 (GY/BN) open or short to ground
- Circuit CLS10 (GN/BN) open
- Circuit RET24 (BN/BU) open
- Reversing lamps relay
- BJB
- TCM

PINPOINT TEST U: THE REVERSING LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take

U1 CHECK THE REVERSING LAMPS RELAY	
• Key in OFF position. • Disconnect: Reversing Lamps Relay. • Carry out the reversing lamps relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the reversing lamps relay OK?**	**Yes** GO to U2 . **No** INSTALL a new reversing lamps relay. TEST the system for normal operation.
U2 CHECK THE BJB	
• Measure the voltage between the reversing lamps relay pin 3, harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to U3 . **No** VERIFY the BJB fuse 33 (20A) is OK. If OK, INSTALL a new BJB. TEST the system for normal operation.
U3 CHECK CIRCUIT CLS10 (GN/BN) FOR AN OPEN	
• Connect a fused (15A) jumper wire between the reversing lamps relay pin 3, harness side and the reversing lamps relay pin 5, circuit CLS10 (GN/BN), harness side.	**Yes** REMOVE the jumper wire. GO to U4 . **No** REPAIR the circuit. TEST the system for normal operation.



N0058686

- **Do the reversing lamps illuminate?**

U4 CHECK CIRCUIT CAT03 (GY/BN) FOR A SHORT TO GROUND	
• Disconnect: TCM C1548 or C1473. • Measure the resistance between the reversing lamps relay pin 1, circuit CAT03 (GY/BN), harness side and ground.  N0058687 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to U5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
U5 CHECK CIRCUITS CAT03 (GY/BN) AND RET24 (BN/BU) FOR AN OPEN	
• Measure the resistance between the reversing lamps relay pin 1, circuit CAT03 (GY/BN), harness side and the TCM C1548-7 or C1473-7, circuit CAT03 (GY/BN), harness side; and between the	**Yes** GO to U6 .

reversing lamps relay pin 2, circuit RET24 (BN/BU), harness side and the TCM C1548-15 or C1473-15, circuit RET24 (BN/BU), harness side.  • **Are the resistances less than 5 ohms?**	**No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
U6 CHECK FOR CORRECT TCM OPERATION	

• Disconnect the TCM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the TCM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCM. REFER to Section 307-01A , Manual Control Valve Body or Section 307-01B , Mechatronic Assembly. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Pinpoint Test V: The Individual Reversing Lamp Is Inoperative

Refer to Wiring Diagrams Cell 93 , Reversing Lamps for schematic and connector information.

When the reversing lamps relay is energized, voltage is routed to the reversing lamps through circuit CLS10 (GN/BN). The LH and RH reversing lamps are provided ground through circuits GD149 (BK/GY) and GD151 (BK/GN), respectively.

Possible Causes

- Circuit CLS10 (GN/BN) open

- Circuit GD149 (BK/GY) open
- Circuit GD151 (BK/GN) open

PINPOINT TEST V: THE INDIVIDUAL REVERSING LAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>V1 CHECK CIRCUIT GD149 (BK/GY) OR CIRCUIT GD151 (BK/GN) FOR AN OPEN</td><td rowspan="2">Yes
REPAIR circuit CLS10 (GN/BN). TEST the system for normal operation.

No
REPAIR the ground circuit in question. TEST the system for normal operation.</td></tr>
<tr><td>

Pinpoint Test W: The Reversing Lamps Are On Continuously

Refer to Wiring Diagrams Cell 93 , Reversing Lamps for schematic and connector information.

Voltage is supplied from the battery junction box (BJB) fuse 33 (20A) to the switched side of the reversing lamps relay. The reversing lamps relay coil power is supplied by the transmission control module (TCM) (also called a main control valve body for Expedition and a mechatronic assembly for Navigator) through circuit CAT03 (GY/BN). The reversing lamps relay coil ground is controlled by the TCM through circuit RET24 (BN/BU). When the reversing lamps relay is energized, voltage is routed to the reversing lamps, the interior rear view mirror, and BJB fuse 63 (15A) (trailer tow reversing lamps) through circuit CLS10 (GN/BN). Voltage from the BJB fuse 63 (15A) is then routed to the trailer tow connector through circuit CAT16 (GY/BN).

DTC P1912 — sets when the TCM detects a short to voltage from the reversing lamps relay coil voltage supply circuit.

Possible Causes

- Circuit CAT03 (GY/BN) short to voltage
- Circuit CAT16 (GY/BN) short to voltage
- Circuit CLS10 (GN/BN) short to voltage

- Reversing lamps relay
- Rear view mirror
- TCM

PINPOINT TEST W: THE REVERSING LAMPS ARE ON CONTINUOUSLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
W1 CHECK THE REVERSING LAMPS RELAY OUTPUT	
• Key in OFF position. • Disconnect: Reversing Lamps Relay. • Key in ON position. • **Do the reversing lamps continue to illuminate?**	**Yes** GO to W4 . **No** GO to W2 .
W2 CHECK THE REVERSING LAMPS RELAY	
• Key in OFF position. • Carry out the reversing lamps relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the reversing lamps relay OK?**	**Yes** GO to W3 . **No** INSTALL a new reversing lamps relay. TEST the system for normal operation.
W3 CHECK CIRCUIT CAT03 (GY/BN) FOR A SHORT TO VOLTAGE	
• Connect: Reversing Lamps Relay. • Disconnect: TCM C1548 or C1473. • Key in ON position. • **Do the reversing lamps continue to illuminate?**	**Yes** GO to W6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
W4 CHECK CIRCUIT CAT16 (GY/BN) FOR A SHORT TO VOLTAGE	
• Disconnect: BJB Fuse 63 (15A). • **Do the reversing lamps continue to illuminate?**	**Yes** GO to W5 . **No** REPAIR the circuit. TEST the system for normal operation.
W5 CHECK CIRCUITS CLS10 (GN/BN) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Interior Rear View Mirror C911 or C9012. • Key in ON position.	**Yes** INSTALL a new interior rear view mirror. REFER to Section 501-09 . TEST the system for normal operation.

• **Do the reversing lamps continue to illuminate?**	**No** REPAIR the circuit. TEST the system for normal operation.
W6 CHECK FOR CORRECT TCM OPERATION	

• Disconnect the TCM connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the TCM connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCM. REFER to Section 307-01A , Manual Control Valve Body or Section 307-01B , Mechatronic Assembly. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Trailer Lamps

Printable View (354 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

The trailer lamps and battery charge are supplied power by various relays that are energized to correspond with the exterior lighting functions of the vehicle. If equipped, the vehicle also supplies circuitry to support the installation of an aftermarket trailer brake control module (installed by the customer). The vehicle circuitry only supplies voltage, ground, voltage from the parking lamps circuit (to support backlighting), stoplamp switch input and a controlling circuit to the trailer tow connector. The trailer electric brakes themselves are controlled by the aftermarket trailer brake control module and not the vehicle itself.

Inspection and Verification

1. Verify the customer concern.
2. Verify the exterior lighting system of the vehicle is operating correctly. If not, refer to the appropriate pinpoint test in this section.
3. Visually inspect the following for obvious signs of electrical damage.

Visual Inspection Chart

Electrical

• Battery junction box (BJB) fuse(s):
  ▪ 5 (40A) (trailer electric brake controller)
  ▪ 12 (25A) (trailer tow parking lamps)
  ▪ 13 (30A) (trailer tow battery charge relay switch side)
  ▪ 34 (25A) (trailer tow turn relays)
  ▪ 63 (15A) (trailer tow reversing lamps)
• Smart junction box (SJB) fuse 42 (10A) (trailer tow battery charge relay coil)
• Circuitry
• Trailer tow turn/stop relays
• Trailer tow battery charge relay

- Trailer tow parking lamp relay
- Trailer brake control module
- Trailer
- SJB

4. If the concern is not visually evident, verify the symptom. GO to Symptom Chart .

Pinpoint Tests

Pinpoint Test X: The Trailer Lamps Are Inoperative — All

Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

Normal Operation

The trailer tow connectors receive ground through circuit RAT08 (WH) for all of the trailer lamps.

Possible Causes

- Circuit RAT08 (WH) open
- Trailer

PINPOINT TEST X: THE TRAILER LAMPS ARE INOPERATIVE — ALL

Test Step	Result / Action to Take
X1 CHECK CIRCUIT RAT08 (WH) FOR AN OPEN	
• Disconnect: Trailer Tow C4098 (4-Pin). • Disconnect: Trailer Tow C4099 (7-Pin) . • Measure the resistance between the trailer tow C4098-4, circuit RAT08 (WH), harness side and ground; or the trailer tow C4099-2, circuit RAT08 (WH), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test Y: The Individual Trailer Lamp Is Inoperative — Trailer Turn/Stoplamp

Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

Normal Operation

The trailer tow LH turn relay coil receives voltage through circuit CLS18 (GY/BN) when the vehicle LH rear stoplamp is illuminated. When the trailer tow LH turn relay is energized, the voltage is routed to the trailer tow connector through circuit CAT06 (YE).

The trailer tow RH turn relay coil receives voltage through circuit CLS19 (VT/OG) when the vehicle RH rear stoplamp is illuminated. When the trailer tow RH turn relay is energized, the voltage is routed to the trailer tow connector through circuit CAT09 (OG).

The battery junction box (BJB) fuse 34 (25A) supplies voltage to both trailer tow turn relays. The trailer tow turn/stop relay coils are grounded through circuit GD123 (BK/GY).

Possible Causes

- Fuse
- Circuit CAT06 (YE) open
- Circuit CAT09 (OG) open
- Circuit CLS18 (GY/BN) open

- Circuit CLS19 (VT/OG) open
- Circuit GD123 (BK/GY) open
- BJB
- Trailer tow turn relay
- Trailer

PINPOINT TEST Y: THE INDIVIDUAL TRAILER LAMP IS INOPERATIVE — TRAILER TURN/STOPLAMP

Test Step	Result / Action to Take
Y1 CHECK CIRCUIT CAT06 (YE) OR CIRCUIT CAT09 (OG) FOR VOLTAGE • Key in OFF position. • Disconnect: Trailer Tow C4098 (4-Pin). • Disconnect: Trailer Tow C4099 (7-Pin) . • For the RH trailer turn/stoplamp, while applying the brake pedal, measure the voltage between the trailer tow C4098-1, circuit CAT09 (OG), harness side and ground; or between the trailer tow C4099-4, circuit CAT09 (OG), harness side and ground.  • For the LH trailer turn/stoplamp, while applying the brake pedal, measure the voltage between the trailer tow C4098-2, circuit CAT06 (YE), harness side and ground; or between the trailer tow C4099-1, circuit CAT06 (YE), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** GO to Y2 .
Y2 CHECK THE TRAILER TOW TURN RELAY • Disconnect: Suspect Trailer Tow Turn Relay. • Carry out the trailer tow turn relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the trailer tow turn relay OK?**	**Yes** GO to Y3 . **No** INSTALL a new trailer tow turn relay. TEST the system for normal operation.
Y3 CHECK CIRCUIT CLS18 (GY/BN) OR CIRCUIT CLS19 (VT/OG)	

FOR AN OPEN	
• While applying the brake pedal, measure the voltage between the trailer tow LH turn relay pin 1, circuit CLS18 (GY/BN), harness side and ground; or between the trailer tow RH turn relay pin 1, circuit CLS19 (VT/OG), harness side and ground.  N0058689 • **Is the voltage greater than 10 volts?**	**Yes** GO to Y4 . **No** REPAIR the circuit in question. TEST the system for normal operation.
Y4 CHECK THE BJB	
• Measure the voltage between the trailer tow LH turn relay pin 3, harness side and ground; or between the trailer tow RH turn relay pin 3, harness side and ground.  N0058690 • **Is the voltage greater than 10 volts?**	**Yes** GO to Y5 . **No** VERIFY the BJB fuse 34 (25A) is OK. If OK, INSTALL a new BJB. TEST the system for normal operation.

Y5 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN	
• Measure the resistance between the trailer tow LH turn relay pin 2, circuit GD123 (BK/GY), harness side and ground; or between the trailer tow RH turn relay pin 2, circuit GD123 (BK/GY), harness side and ground.  N0058691 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR circuit CAT06 (YE) (LH trailer turn/stop) or circuit CAT09 (OG) (RH trailer turn/stop) for an open. TEST the system for normal operation. **No** REPAIR the ground circuit in question. TEST the system for normal operation.

Pinpoint Test Z: The Trailer Lamps Are Inoperative — Trailer Parking Lamps

Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

Normal Operation

The trailer tow parking lamp relay coil receives voltage through circuit CLS30 (VT/WH) when the vehicle parking lamps are illuminated. The trailer tow parking lamp relay coil is grounded through circuit GD123 (BK/GY). The battery junction box (BJB) supplies voltage to the trailer tow parking lamp relay switch side through circuit SBB12 (GN/RD). When the trailer tow parking lamp relay is energized, the voltage is routed to the trailer tow connector through circuit CAT11 (BN).

Possible Causes

- Fuse
- Circuit CAT11 (BN) open
- Circuit CLS30 (VT/WH) open
- Circuit GD123 (BK/GY) open
- Circuit SBB12 (GN/RD) open
- Trailer tow parking lamp relay
- Trailer

PINPOINT TEST Z: THE TRAILER LAMPS ARE INOPERATIVE — TRAILER PARKING LAMPS

Test Step	Result / Action to Take

Z1 CHECK CIRCUIT CAT11 (BN) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Trailer Tow C4098 (4-Pin). • Disconnect: Trailer Tow C4099 (7-Pin) . • Place the headlamp switch in the PARKING LAMPS ON position. • Measure the voltage between the trailer tow C4098-3, circuit CAT11 (BN), harness side and ground; or between the trailer tow C4099-6, circuit CAT11 (BN), harness side and ground.  A0058633 • **Is the voltage greater than 10 volts?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** GO to Z2 .
Z2 CHECK THE TRAILER TOW PARKING LAMP RELAY	
• Place the headlamp switch in the OFF position. • Disconnect: Trailer Tow Parking Lamp Relay. • Carry out the trailer tow parking lamp relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the trailer tow parking lamp relay OK?**	**Yes** GO to Z3 . **No** INSTALL a new trailer tow parking lamp relay. TEST the system for normal operation.
Z3 CHECK CIRCUIT CLS30 (VT/WH) FOR AN OPEN	
• Place the headlamp switch in the PARKING LAMPS ON position. • Measure the voltage between the trailer tow parking lamp relay pin 85, circuit CLS30 (VT/WH), harness side and ground.  N0058692	**Yes** GO to Z4 . **No** REPAIR the circuit in question. TEST the system for normal operation.

• **Is the voltage greater than 10 volts?**	
Z4 CHECK CIRCUIT SBB12 (GN/RD) FOR AN OPEN	
• Place the headlamp switch in the OFF position. • Measure the voltage between the trailer tow parking lamp relay pin 30, circuit SBB12 (GN/RD), harness side and ground.  N0058693 • **Is the voltage greater than 10 volts?**	**Yes** GO to Z5 . **No** VERIFY the BJB fuse 12 (25A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.
Z5 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN	
• Measure the resistance between the trailer tow parking lamp relay pin 86, circuit GD123 (BK/GY), harness side and ground.  N0058694 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR circuit CAT11 (BN) for an open. TEST the system for normal operation. **No** REPAIR circuit GD123 (BK/GY. TEST the system for normal operation.

Pinpoint Test AA: The Trailer Lamps Are Inoperative — Trailer Reversing Lamps

Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

Normal Operation

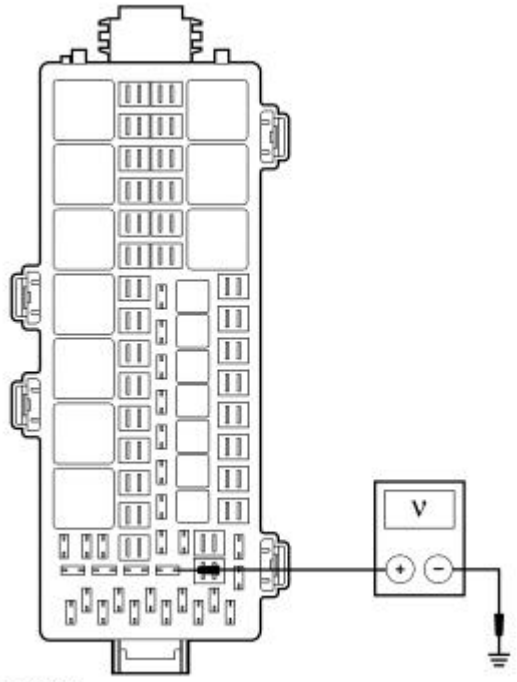
The battery junction box (BJB) fuse 63 (15A) receives voltage from circuit CLS10 (GY/BN) when the vehicle reversing lamps are illuminated. The voltage is then routed to the trailer tow connector through circuit CAT16 (GY/BN).

Possible Causes

- Fuse
- Circuit CAT16 (GY/BN) open
- Circuit CLS10 (GY/BN) open
- Trailer

PINPOINT TEST AA: THE TRAILER LAMPS ARE INOPERATIVE — TRAILER REVERSING LAMPS

Test Step	Result / Action to Take
AA1 CHECK CIRCUIT CAT16 (GY/BN) FOR VOLTAGE	
• Disconnect: Trailer Tow C4099 (7-Pin) . • Apply the parking brake. • Key in ON position. • Place the transmission in REVERSE (R). • Measure the voltage between the trailer tow C4099-7, circuit CAT16 (GY/BN), harness side and ground.  A0025848 • **Is the voltage greater than 10 volts?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** VERIFY the BJB fuse 63 (15A) is OK. If OK, GO to AA2 .
AA2 CHECK FOR VOLTAGE TO THE BJB FUSE 63 (15A)	
• Measure the voltage between the BJB fuse 63 (15A), circuit CLS10 (GY/BN), input side and ground.	**Yes** REPAIR circuit CAT16 (GY/BN) for an open. TEST the system for normal operation. **No** REPAIR circuit CLS10 (GY/BN) for an open. TEST the system for normal operation.



- **Is the voltage greater than 10 volts?**

Pinpoint Test AB: The Trailer Lamps Are On Continuously

Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

Normal Operation — Trailer Tow Turn/Stoplamp

The trailer tow LH turn relay coil receives voltage through circuit CLS18 (GY/BN) when the vehicle LH rear stoplamp is illuminated. When the trailer tow LH turn relay is energized, the voltage is routed to the trailer tow connector through circuit CAT06 (YE).

The trailer tow RH turn relay coil receives voltage through circuit CLS19 (VT/OG) when the vehicle RH rear stoplamp is illuminated. When the trailer tow RH turn relay is energized, the voltage is routed to the trailer tow connector through circuit CAT09 (OG).

Normal Operation — Trailer Tow Parking

The trailer tow parking lamp relay coil receives voltage through circuit CLS30 (VT/WH) when the vehicle parking lamps are illuminated. When the trailer tow parking lamp relay is energized, the voltage is routed to the trailer tow connector through circuit CAT11 (BN).

Possible Causes

- Circuit CAT06 (YE) short to voltage
- Circuit CAT09 (OG) short to voltage
- Circuit CAT11 (BN) short to voltage
- Trailer tow relay
- Trailer

PINPOINT TEST AB: THE TRAILER LAMPS ARE ON CONTINUOUSLY

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>AB1 CHECK FOR VOLTAGE AT THE TRAILER TOW CONNECTOR</td><td></td></tr>
<tr><td>

Key in OFF position.
Disconnect: Trailer Tow C4098 (4-Pin).
Disconnect: Trailer Tow C4099 (7-Pin) .
Key in ON position.
Measure the voltage the between trailer tow connector, harness side and ground as follows:

<table>
<tr><th>Trailer Tow Connector</th><th>Connector-Pin</th><th>Circuit</th></tr>
<tr><td>4-pin
7-pin</td><td>C4098-2
C4099-1</td><td>CAT06
(YE)</td></tr>

C4099-4</td><td>CAT09
(OG)</td></tr>
<tr><td>4-pin
7-pin</td><td>C4098-3
C4099-6</td><td>CAT11
(BN)</td></tr>
</table>

Is any voltage present?

</td><td>Yes
GO to AB2 .

No
The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility.</td></tr>
<tr><td>AB2 CHECK THE SUSPECT RELAY</td><td></td></tr>
<tr><td>

Key in OFF position.
Disconnect: Suspect Trailer Tow Relay.
Carry out the component test for the suspect trailer tow relay.

Refer to Wiring Diagrams Cell 149 for schematic and connector information.
Is the trailer tow relay OK?

</td><td>Yes
REPAIR circuit CAT06 (YE) (LH turn), circuit CAT09 (OG) (RH turn), or circuit CAT11 (BN) (parking lamps) for a short to voltage. TEST the system for normal operation.

No
INSTALL a new turn trailer tow relay. TEST the system for normal operation.</td></tr>
</table>

Pinpoint Test AC: The Trailer Battery Charging Is Inoperative/Does Not Operate Correctly

Normal Operation

The trailer battery charge relay coil receives voltage from the smart junction box (SJB) fuse 42 (10A) through circuit CAT23 (GY/YE) when the ignition switch is in the RUN position. Ground for the trailer battery charge relay coil is supplied through circuit GD123 (BK/GY). The battery junction box (BJB) fuse 13 (30A) supplies voltage to the trailer battery charge relay switch side through circuit SSB13 (GY/RD). When the trailer battery charge relay is energized, the voltage is routed to the trailer tow connector through circuit CAT14 (OG).

Possible Causes

- Fuse
- Circuit CAT14 (OG) open or short to voltage
- Circuit CAT23 (GY/YE) open or short to voltage
- Circuit GD123 (BK/GY) open
- Circuit SSB13 (GY/RD) open
- Trailer battery charge relay
- Trailer
- SJB

PINPOINT TEST AC: THE TRAILER BATTERY CHARGING IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
AC1 CHECK FOR VOLTAGE AT THE TRAILER TOW CONNECTOR (BATTERY CHARGE INOPERATIVE)	
• Key in OFF position. • Disconnect: Trailer Tow C4099. • Key in ON position. • Measure the voltage between the trailer tow C4099-5, circuit CAT14 (OG) and ground.  A0025428 • **Is the voltage greater than 10 volts?**	**Yes** GO to AC7 . **No** GO to AC2 .
AC2 CHECK THE TRAILER BATTERY CHARGE RELAY (INOPERATIVE)	
• Key in OFF position. • Disconnect: Trailer Battery Charge Relay. • Carry out the trailer battery charge relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the trailer battery charge relay OK?**	**Yes** GO to AC3 . **No** INSTALL a new trailer battery charge relay. TEST the system for normal operation.
AC3 CHECK CIRCUIT SSB13 (GY/RD) FOR AN OPEN	
• Measure the voltage between the trailer battery charge relay pin 30, circuit SSB13 (GY/RD), harness side and ground.	**Yes** GO to AC4 . **No** VERIFY the BJB fuse 13 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

 N0058696 • **Is the voltage greater than 10 volts?**	
AC4 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the trailer battery charge relay pin 86, circuit GD123 (BK/GY), harness side and ground.  N0058697 • **Is the resistance less than 5 ohms?**	**Yes** GO to AC5 . **No** REPAIR the circuit. TEST the system for normal operation.
AC5 CHECK FOR VOLTAGE TO THE TRAILER BATTERY CHARGE RELAY COIL	
• Key in ON position. • Measure the voltage between the trailer battery charge relay	**Yes** REPAIR circuit CAT14

pin 85, circuit CAT23 (GN/YE), harness side and ground.  N0058698 • **Is the voltage greater than 10 volts?**	(OG) for an open. TEST the system for normal operation. **No** VERIFY the SJB fuse 42 (10A) is OK. If OK, GO to AC6 .
AC6 CHECK CIRCUIT CAT23 (GN/YE) FOR AN OPEN	
• Key in OFF position. • Disconnect: SJB C2280g. • Measure the resistance between the trailer battery charge relay pin 85, circuit CAT23 (GN/YE), harness side and the SJB C2280g-1, circuit CAT23 (GN/YE), harness side.  N0058699 • **Is the resistance less than 5 ohms?**	**Yes** GO to AC11 . **No** REPAIR the circuit. TEST the system for normal operation.
AC7 CHECK FOR VOLTAGE AT THE TRAILER TOW CONNECTOR (BATTERY CHARGE ALWAYS ON)	

• Key in OFF position. • Measure the voltage between the trailer tow C4099-5, circuit CAT14 (OG) and ground.  A0025428 • **Is any voltage present?**	**Yes** GO to AC8 . **No** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility.
AC8 CHECK CIRCUIT CAT14 (OG) FOR A SHORT TO VOLTAGE	
• Disconnect: Trailer Battery Charge Relay. • Measure the voltage between the trailer tow C4099-5, circuit CAT14 (OG) and ground.  A0025428 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to AC9 .
AC9 CHECK THE TRAILER BATTERY CHARGE RELAY (ALWAYS ON)	
• Carry out the trailer battery charge relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the trailer battery charge relay OK?**	**Yes** GO to AC10 . **No** INSTALL a new trailer battery charge relay. TEST the system for normal operation.
AC10 CHECK CIRCUIT CAT23 (GN/YE) FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280g. • Measure the voltage between the trailer battery charge relay pin 86, circuit CAT23 (GN/YE), harness side and ground.	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to AC11 .

 • **Is any voltage present?**	
AC11 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AD: The Trailer Electric Brakes Are Inoperative/Do Not Operate Correctly

Normal Operation

The trailer brake control module is provided voltage at all times by the battery junction box (BJB) fuse 5 (40A) through circuit SBB05 (GY/RD). Ground for the trailer brake control module is provided through circuit GD138 (BK/WH). The trailer brake control module receives voltage from the stoplamp switch through circuit CLS17 (YE/GY) when the brake pedal is applied. When requested, the trailer brake control module sends voltage to the trailer tow connector through circuit CAT19 (BU). Circuit CLS30 (VT/WH) supplies voltage to the trailer brake control module when the parking lamps are on.

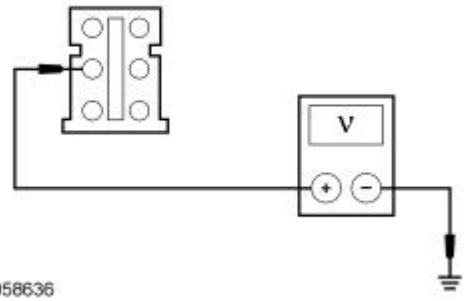
Possible Causes

- Fuse
- Circuit CAT19 (BU) open, short to ground or voltage
- Circuit CLS17 (YE/GY) open
- Circuit CLS30 (VT/WH) open
- Circuit GD138 (BK/WH) open
- Circuit SBB05 (GY/RD) open
- Trailer brake control module

- Trailer

PINPOINT TEST AD: THE TRAILER ELECTRIC BRAKES ARE INOPERATIVE/DO NOT OPERATE CORRECTLY

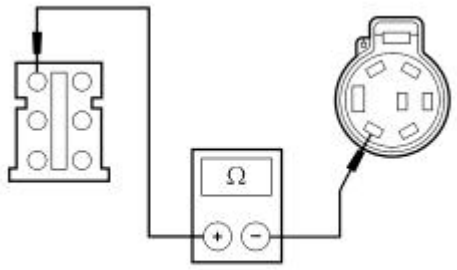
Test Step	Result / Action to Take
AD1 CHECK FOR VOLTAGE TO THE TRAILER TOW CONNECTOR (INOPERATIVE CONDITION)	
• Key in OFF position. • Disconnect: Trailer Tow C4099. • While applying the brake pedal, measure the voltage between the trailer tow C4099-3, circuit CAT19 (BU), harness side and ground.  A0025430 • **Is the voltage greater than 10 volts?**	**Yes** GO to AD8 . **No** GO to AD2 .
AD2 CHECK CIRCUIT SBB05 (GY/RD) FOR AN OPEN	
• Disconnect: Trailer Brake Control Module C2142. • Measure the voltage between the trailer brake control module C2142-1, circuit SBB17 (RD), harness side and ground.  A0056726 • **Is the voltage greater than 10 volts?**	**Yes** GO to AD3 . **No** VERIFY the BJB fuse 12 (40A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.
AD3 CHECK CIRCUIT CLS17 (YE/GY) FOR AN OPEN	
• While applying the brake pedal, measure the voltage between the trailer brake control module C2142-2, circuit CLS17 (YE/GY), harness side and ground.	**Yes** GO to AD4 . **No** REPAIR the circuit. TEST the system for normal operation.



A0058636

- **Is the voltage greater than 10 volts?**

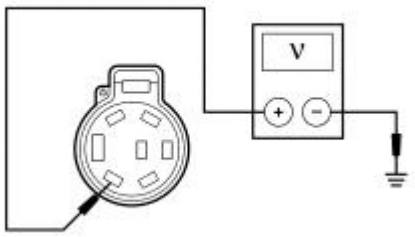
AD4 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Measure the resistance between the trailer brake control module C2142-6, circuit GD138 (BK/WH), harness side and ground.  A0085422 • **Is the resistance less than 5 ohms?**	**Yes** GO to AD5 . **No** REPAIR the circuit. TEST the system for normal operation.
AD5 CHECK CIRCUIT CAT19 (BU) FOR A SHORT TO GROUND	
• Measure the resistance between the trailer brake control module C2142-3, circuit CAT19 (BU), harness side and ground.  A0085423 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AD6 . **No** REPAIR the circuit. TEST the system for normal operation.
AD6 CHECK CIRCUIT CAT19 (BU) FOR AN OPEN	
• Measure the resistance between the trailer brake control module C2142-3, circuit CAT19 (BU), harness side and the trailer tow C4099-3, circuit CAT19 (BU), harness side.	**Yes** GO to AD7 . **No** REPAIR the circuit. TEST the system for normal operation.



N0037318

- **Is the resistance less than 5 ohms?**

AD7 CHECK CIRCUIT CLS30 (VT/WH) FOR AN OPEN • Place the headlamp switch in the PARKING LAMPS ON position. • Measure the voltage between the trailer brake control module C238-5, circuit CLS30 (VT/WH), harness side and ground.  A0056725 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new trailer brake control module. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
AD8 CHECK FOR VOLTAGE TO THE TRAILER TOW CONNECTOR (DOES NOT OPERATE CORRECTLY) • With the brake pedal released, measure the voltage between the trailer tow C4099-3, circuit CAT19 (BU), harness side and ground.  A0025430 • **Is any voltage present?**	**Yes** GO to AD9 . **No** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility.
AD9 CHECK CIRCUIT CAT19 (BU) FOR A SHORT TO VOLTAGE • Disconnect: Trailer Brake Control Module C2142. • Measure the voltage between the trailer tow C4099-3, circuit CAT19 (BU), harness side and ground.	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new trailer brake control module. TEST the system for normal operation.



A0025430

- **Is any voltage present?**

Headlamp Adjustment

Printable View (119 KB)

Headlamp Aiming

1. The headlamp aiming procedure depends on what type of beam pattern the headlamp is equipped with. Vehicles may come equipped with visual optical left (VOL) or visual optical right (VOR) headlamps. To identify the headlamp beam pattern, look on the headlamp lens. Molded in small letters on the headlamp lens is one of the following:
    - VOL and SAE
    - VOR and SAE

2. Once the headlamp beam pattern is identified, aim the headlamps using one of the following methods as applicable.
    - Photometric aimers can aim VOL- and VOR- headlamps. This is the preferred method of headlamp aiming.
    - Visual or screen method aiming can be used to aim VOL- and VOR- headlamps.
    - Mechanical aimers cannot be used with VOR- or VOL-type headlamps. Aerodynamic lamps that can be aimed mechanically have 3 nibs molded into the lens of the lamp.

Photometric Aiming

1. For the photometric aiming procedure, refer to the appropriate photometric headlamp aimer instruction manual.

Screen Method Aiming

All headlamp types

NOTE: Horizontal aim is not necessary for VOL or VOR headlamps.

NOTE: Consult your state vehicle inspection manual for recommended tolerance ranges for visual aiming.

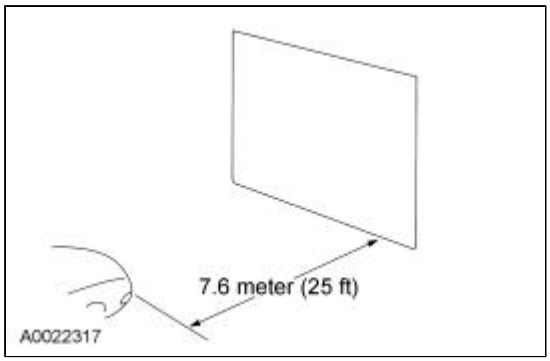
NOTE: The sight shield may need to be positioned or removed for access to the adjusters.

1. Before starting headlamp adjustment:
    - check the tire inflation.
    - check that no other load is in the vehicle other than a half tank of fuel.
    - check that the headlamps are clean.
    - check for correct headlamp operation.
    - check that the vehicle is on level ground.
    - if the vehicle is equipped with air suspension, make sure that the switch is on.

2. **NOTE:** The vertical wall or screen must be a minimum of 2.4-m (8-ft) wide.

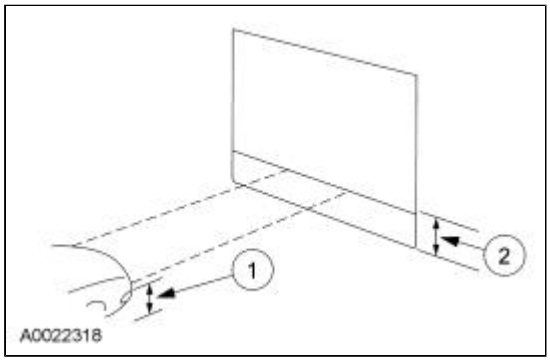
   Park the vehicle on a level surface approximately 7.6-m (25-ft) from the vertical wall or screen

directly in front of it.



3. **NOTE:** The center of the lamp is marked either on the lens (circle, crosshair or other mark) or on the bulb shield internal to the lamp (crosshair or other mark).

   Mark a horizontal reference line on the vertical wall or screen.
   1. Measure the center of the headlamp height to ground and record the measurement.
   2. Make a 2.4-meter (8-ft) horizontal mark (using masking tape) on the vertical wall or screen at the same distance from the ground as previously recorded.



4. **NOTE:** This procedure should be done in a dark environment to effectively see the headlamp beam pattern.

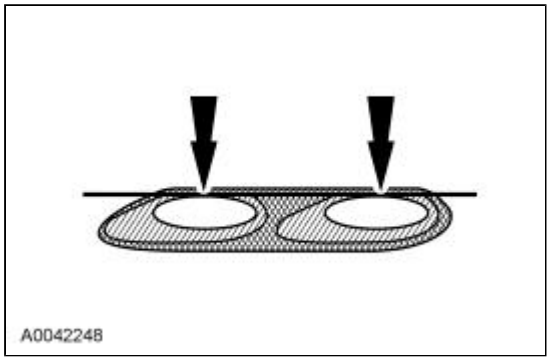
   Turn on the low beam headlamps to illuminate the wall or screen and open the hood.

5. On the wall or screen, locate the high intensity area of the beam pattern.

VOR-type headlamps

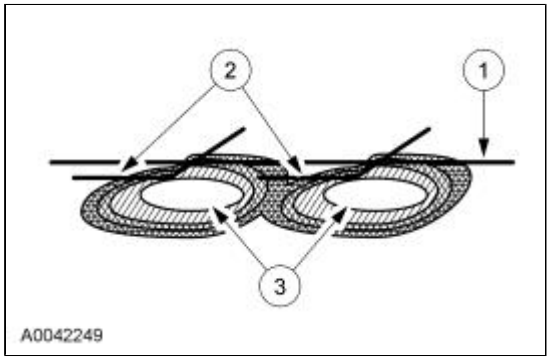
6. **NOTE:** The appearance of the VOR beam pattern may vary between vehicles.

   Identify at the top edge of this high intensity area a distinct horizontal cutoff in the beam pattern. If the top edge of this cutoff is not even with the horizontal reference line, the headlamp beam needs to be adjusted using the headlamp adjusting screw.



VOL-type headlamps

7. For VOL-type headlamps, there is a distinct cutoff in the left portion of the beam pattern. The edge of this cutoff should be positioned 50.2 mm (2 in) below the horizontal reference line. Adjust the headlamp as necessary using the headlamp adjusting screw.
    1. Horizontal reference line.
    2. Top edge of the beam pattern.
    3. High intensity zone.



Mechanical Aiming

1. For the mechanical aiming procedure, refer to the appropriate mechanical headlamp aimer instruction manual.

Front Fog Lamp Adjustment

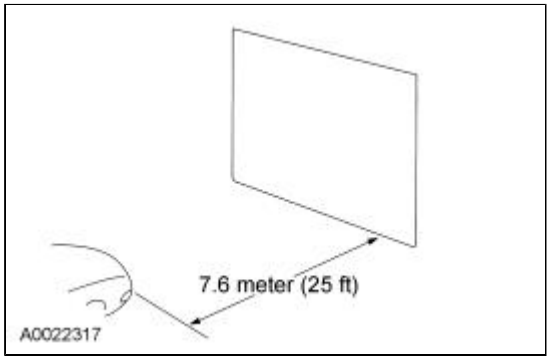
Printable View (93 KB)

1. **NOTE:** Horizontal aim is not required for this vehicle and is not adjustable. Consult your state vehicle inspection center for recommended tolerance ranges for visual aiming.

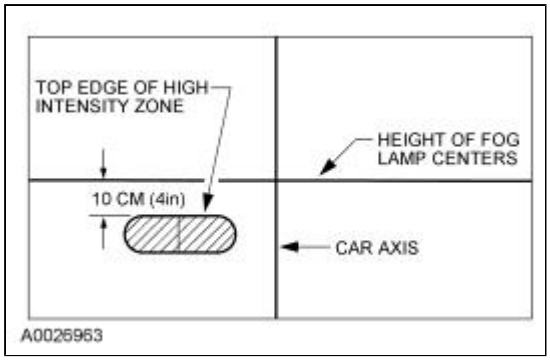
   Before starting the fog lamp assembly adjustment:
   - check the tire inflation.
   - make sure there are no other loads in the vehicle other than a half tank of fuel.
   - make sure the vehicle is on level ground.
   - make sure the fog lamps and headlamps are clean.
   - make sure the headlamps are operating and are correctly aimed.

2. **NOTE:** The vertical wall screen must be a minimum of 2.4-m (8-ft) wide.

   Park the vehicle on a level surface approximately 7.6 m (25 ft) from the vertical wall or screen directly in front of it.



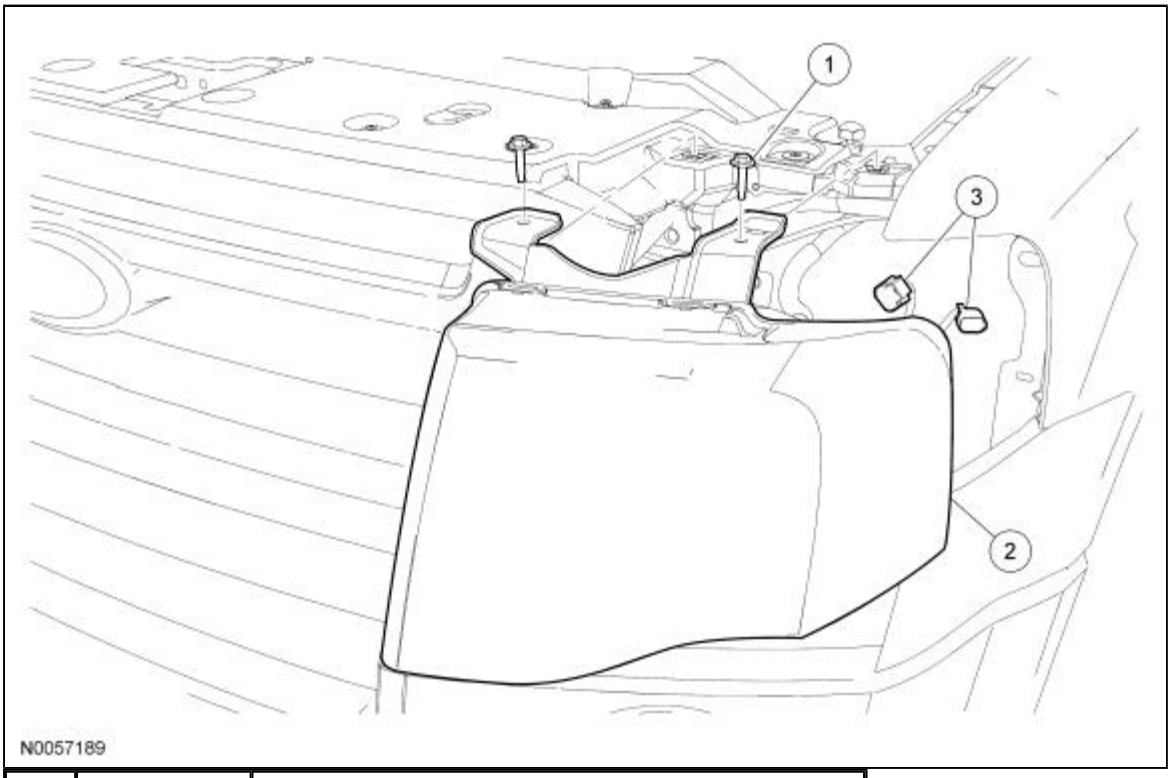
3. The correct visual aim for the fog lamps is with the top edge of the high-intensity zone 10 cm (4 in) below the horizontal center of the fog lamps.



Headlamp Assembly

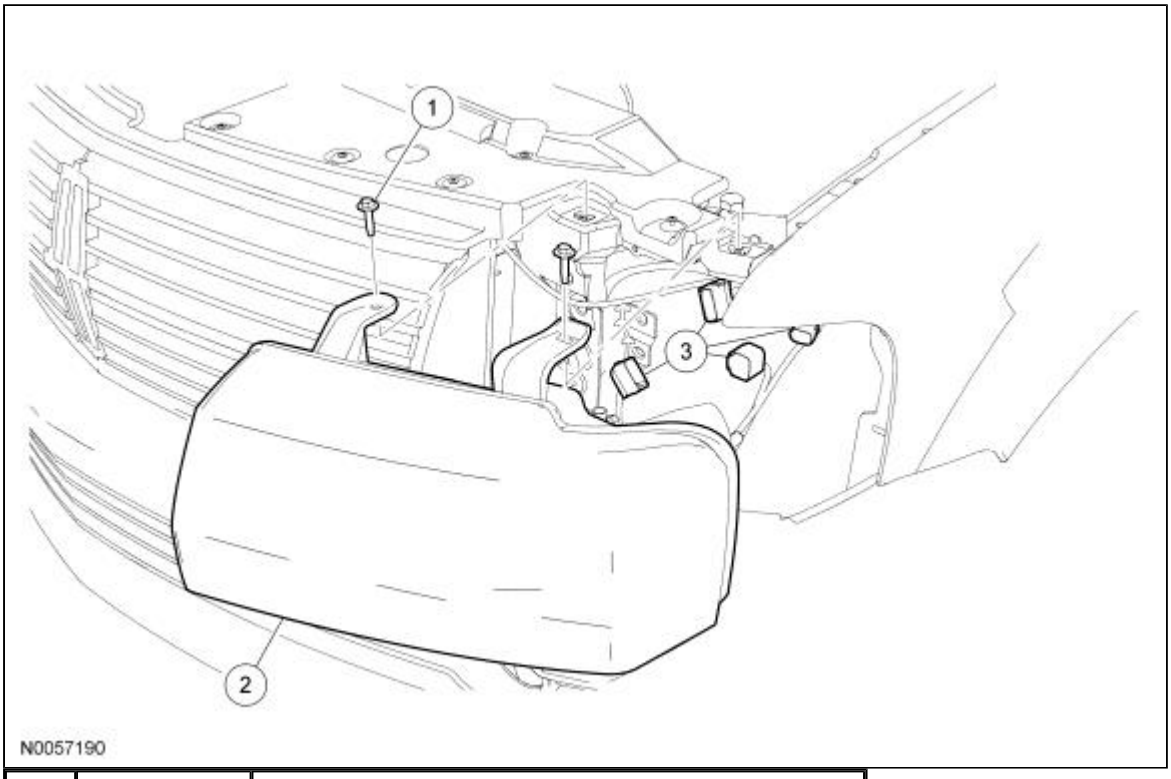
Printable View (233 KB)

Expedition



Item	Part Number	Description
1	W505425	Headlamp assembly bolts (2 required)
2	13006/13005	Headlamp assembly (LH/RH)
3	—	Headlamp assembly electrical connectors (part of 12A581)

Navigator



Item	Part Number	Description
1	W505425	Headlamp assembly bolts (2 required)
2	13006/13005	Headlamp assembly (LH/RH)
3	—	Headlamp assembly electrical connectors (part of 12A581)

Removal and Installation

NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

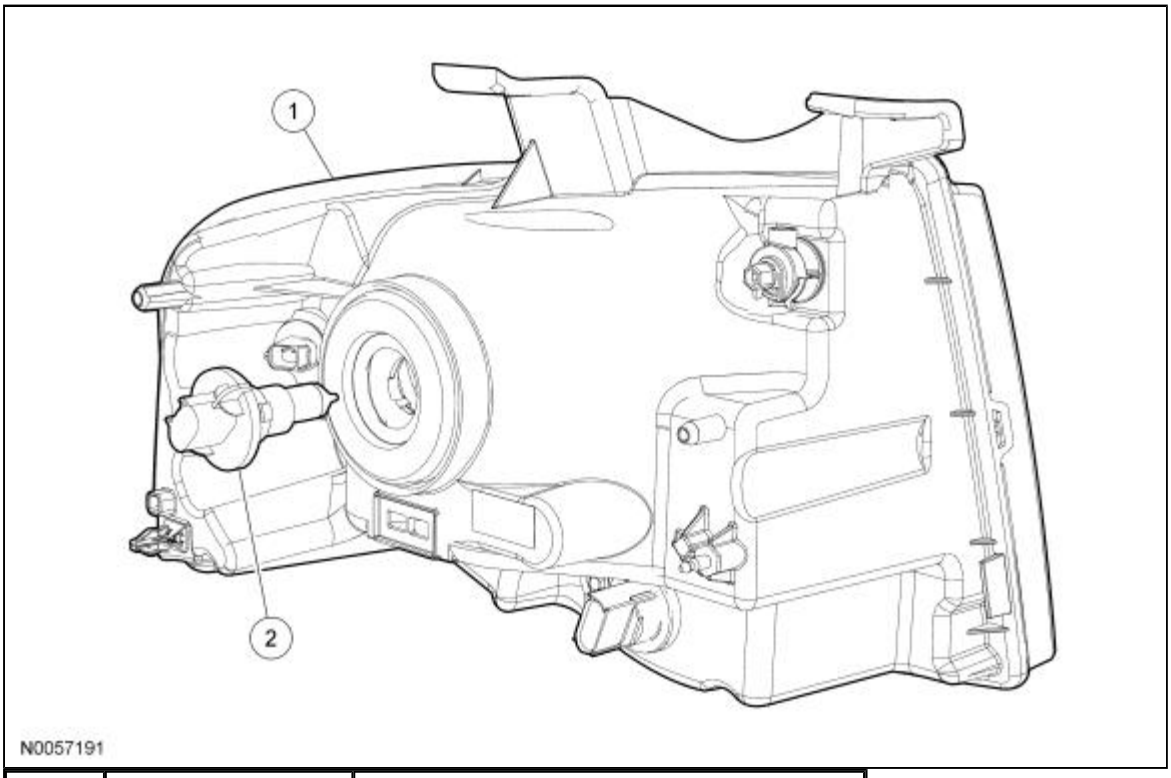
1. Remove the 2 bolts and the headlamp assembly.
   - Disconnect the electrical connectors.

2. To install, reverse the removal procedure.
   - If necessary, adjust the headlamps. For additional information, refer to Headlamp Adjustment in this section.

Headlamp Bulb

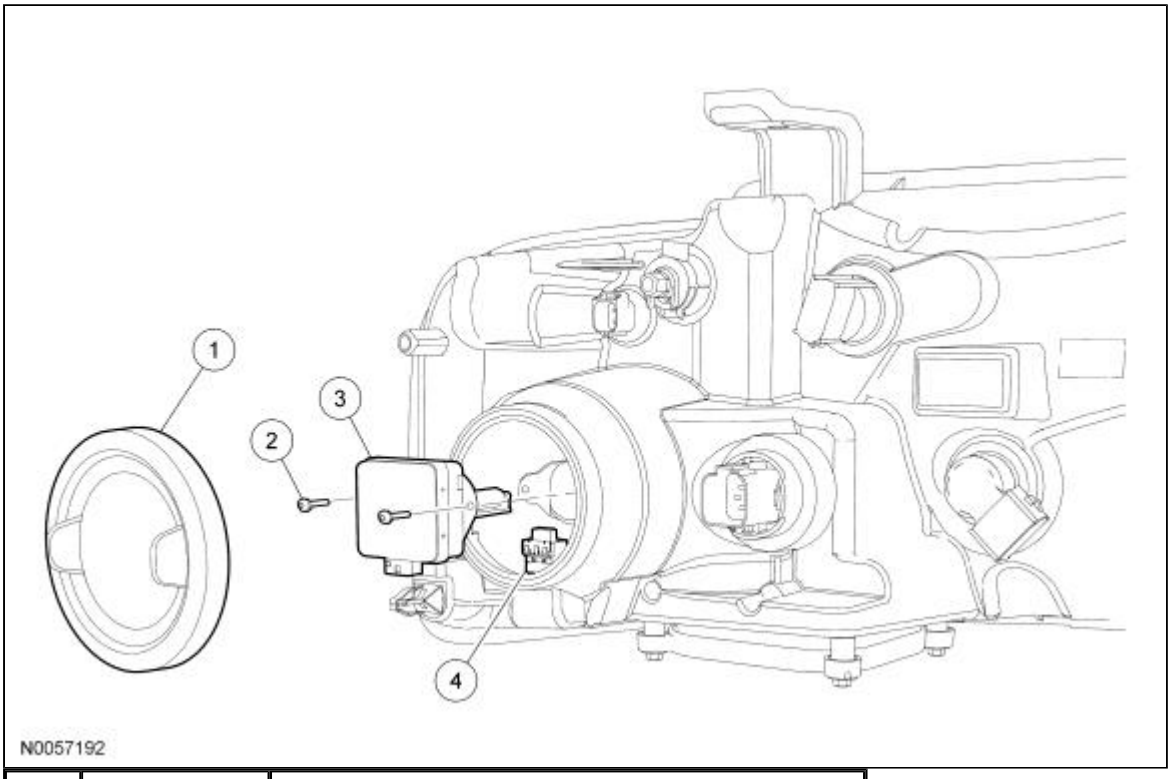
Printable View (255 KB)

Expedition Headlamp



Item	Part Number	Description
1	13006/13005	Headlamp assembly (LH/RH)
2	13N021	Headlamp bulb

Navigator High Intensity Discharge (HID) Headlamp Bulb



Item	Part Number	Description
1	13N019	HID bulb access cover
2	—	HID bulb screws (2 required) (part of 13A006)
3	13N021	HID bulb
4	13A006	HID bulb electrical connector and harness

Removal and Installation

WARNING: The headlamp bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

NOTE: The headlamp bulb should not be removed from the headlamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp where they can settle on the lens and reflector. Never turn on the headlamp with the bulb removed from the headlamp.

NOTE: Make sure that the headlamp switch and the ignition switch are in the OFF position.

All vehicles

1. Remove the headlamp assembly. For additional information, refer to Headlamp Assembly in this section.

Expedition

2. Rotate the headlamp bulb approximately 1/8 turn counterclockwise and remove the bulb from the headlamp assembly.

Navigator

3. Remove the HID bulb access cover.

4. Remove the 2 screws and the HID bulb.
    - Disconnect the electrical connector.

All vehicles

5. To install, reverse the removal procedure.

Ballast

1. Remove the 3 nuts and the fog lamp.
    - Disconnect the electrical connector.

Navigator

2. Remove the 4 bolts and the fog lamp.
    - Disconnect the electrical connector.

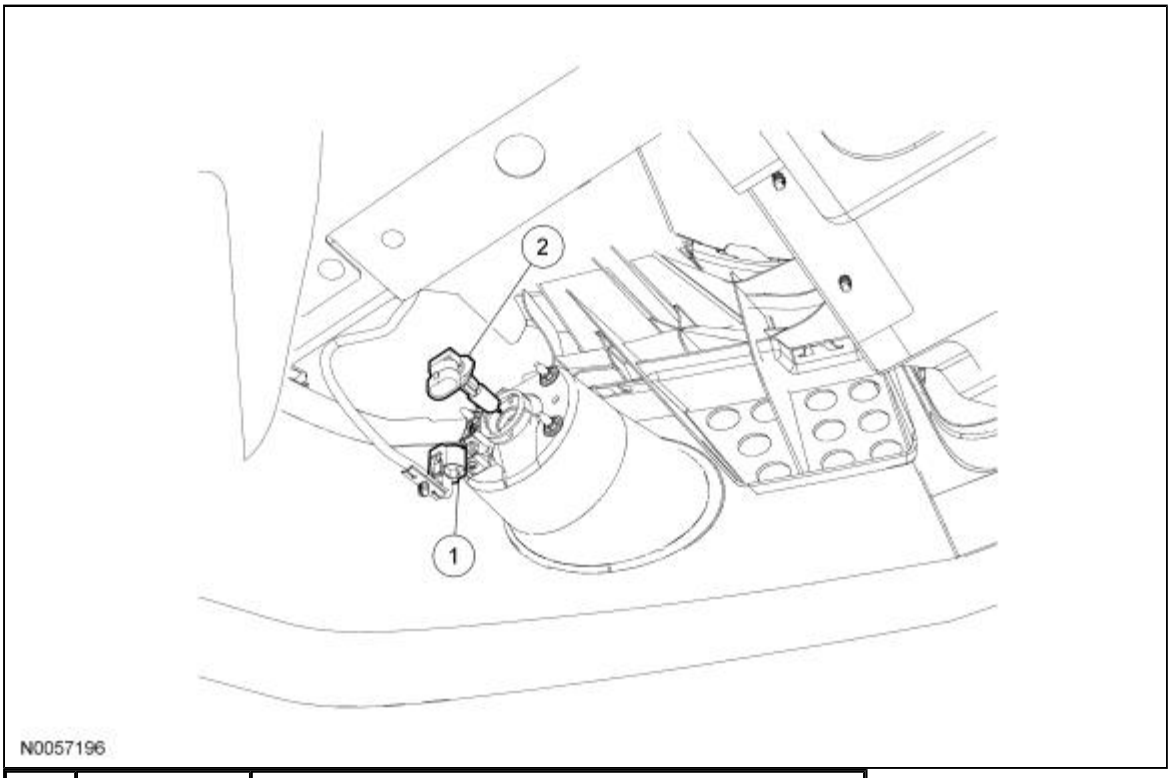
All vehicles

3. To install, reverse the removal procedure.
    - If necessary, adjust the fog lamps. For additional information, refer to Front Fog Lamp Adjustment in this section.

Fog Lamp Bulb

Printable View (145 KB)

NOTE: Expedition shown, Navigator similar.



Item	Part Number	Description
1	—	Fog lamp bulb electrical connector (part of 12A581)
2	13466	Fog lamp bulb

Removal and Installation

WARNING: The fog lamp bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

NOTE: The fog lamp bulb should not be removed from the fog lamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp where they can settle on the lens and reflector. Never turn on the fog lamp with the bulb removed from the fog lamp.

NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

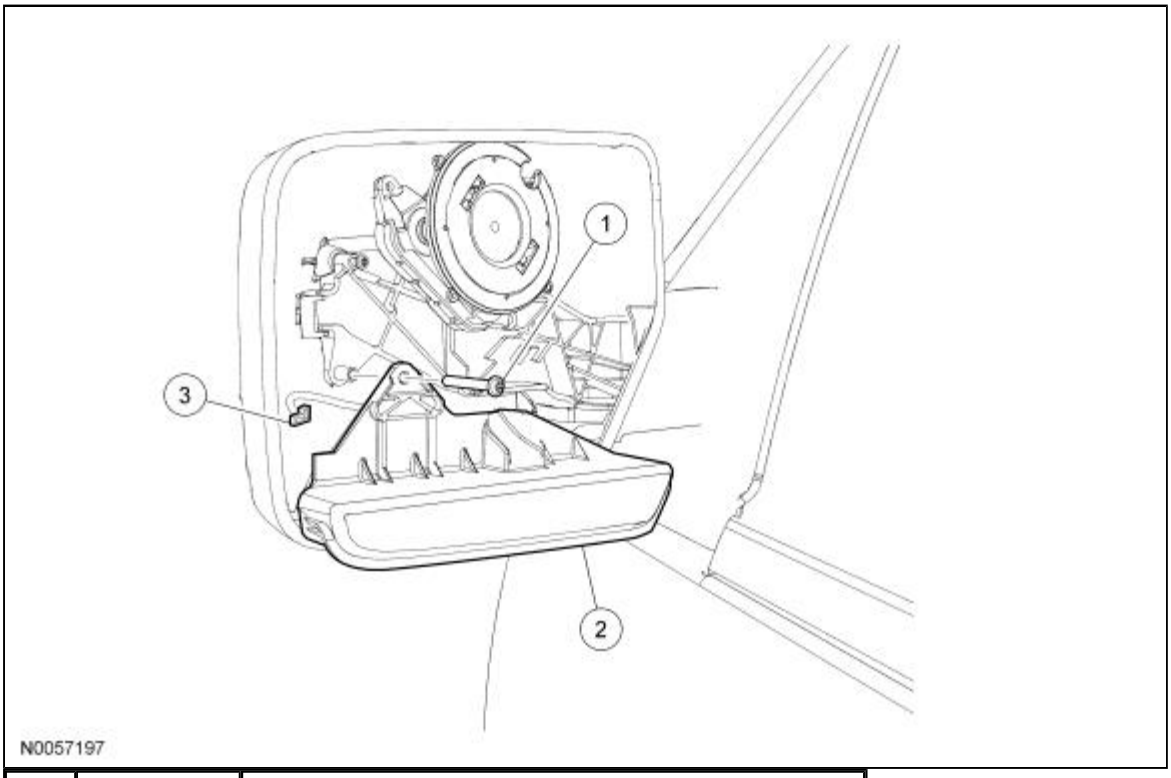
2. Disconnect the electrical connector and remove the fog lamp bulb.

3. To install, reverse the removal procedure.

Side Turn Signal Lamp — Signal Mirror

Printable View (142 KB)

NOTE: Navigator shown, Expedition similar.



Item	Part Number	Description
1	—	Signal mirror LED screw (part of 17682/17683)
2	—	Signal mirror LED (part of 17682/17683)
3	—	Signal mirror LED electrical connector (part of 17682/17683)

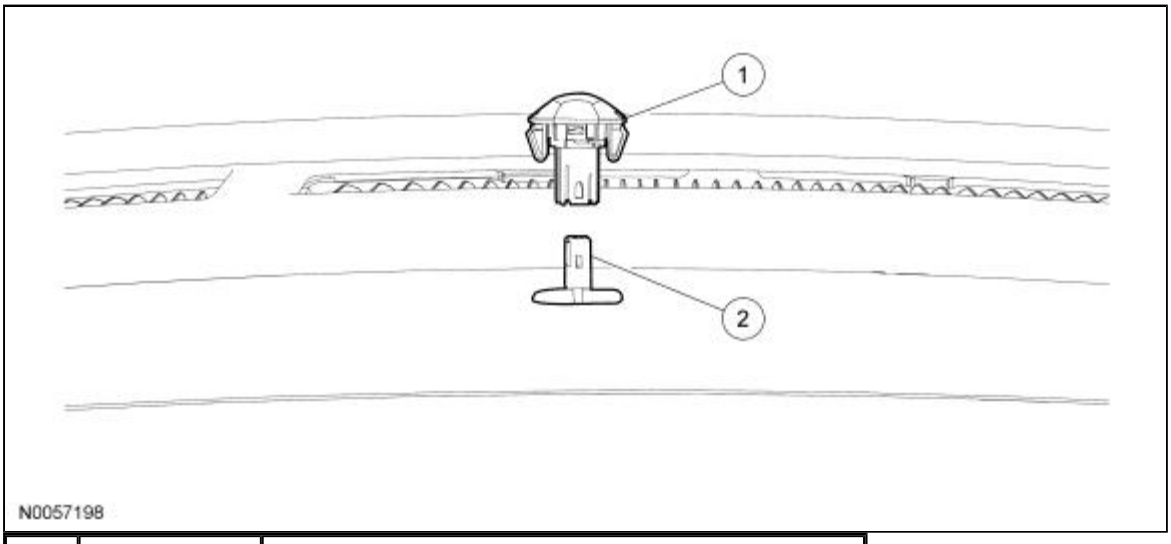
Removal and Installation

1. Remove the mirror glass. For additional information, refer to Section 501-09 .
2. Remove the screw and the signal mirror LED.
   - Disconnect the electrical connector.
3. To install, reverse the removal procedure.

Light Sensor

Printable View (98 KB)

NOTE: Expedition shown, Navigator similar.



Item	Part Number	Description
1	13A018	Light sensor
2	—	Light sensor electrical connector (part of 14401)

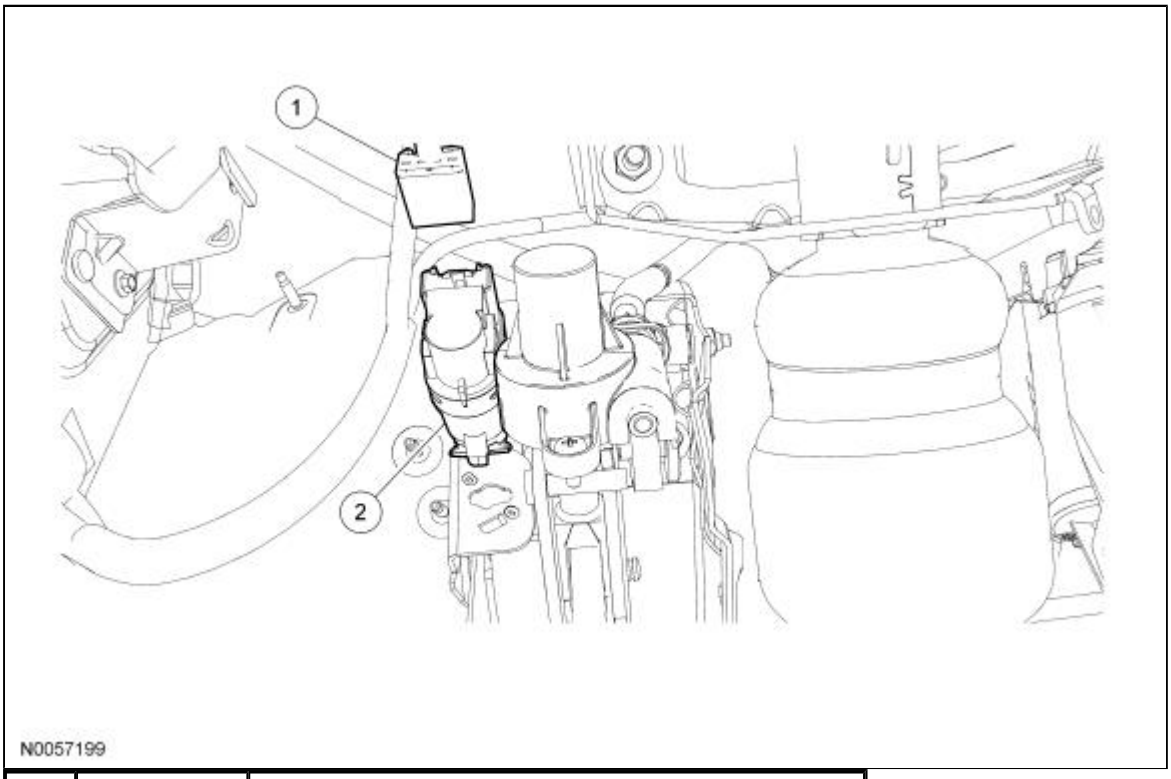
Removal and Installation

1. Using a suitable tool, remove the light sensor from the instrument panel.
    - Disconnect the electrical connector.

2. To install, reverse the removal procedure.

Stoplamp Switch

Printable View (161 KB)



Item	Part Number	Description
1	—	Stoplamp switch electrical connector (part of 12A581)
2	13480	Stoplamp switch

Removal

1. Disconnect the stoplamp switch electrical connector.
2. **NOTE:** The stoplamp switch will be difficult to remove if the switch plunger is not depressed. A slight rearward force should be adequate to depress the plunger.

   With a light force (approximately 1-4 N [1-3 lb]), pull rearward on the brake pedal, rotate the stoplamp switch 45 degrees clockwise and remove the stoplamp switch.

Installation

CAUTION: It is very important to not press, pull or touch the brake pedal assembly during the installation of the stoplamp switch. Failure to follow these instructions may damage the stoplamp switch.

1. Without movement to the brake pedal assembly, install the stoplamp switch and rotate 45 degrees counterclockwise.
2. Connect the stoplamp switch electrical connector.

Headlamp Switch

Item	Part Number	Description
1	N805296	Liftgate parking lamp nuts (4 required)
2	13B505/13B504	Liftgate parking lamp (LH/RH)
3	—	Liftgate parking lamp electrical connectors (part of 14086)

Removal and Installation

1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .
   - Remove the watershield.

2. Remove the 4 nuts and the liftgate parking lamp.
   - Disconnect the electrical connectors.

3. To install, reverse the removal procedure.

Interior Lighting

Printable View (63 KB)

The interior lighting system consists of the following:

- Smart junction box (SJB)
- Interior/map lamp assembly
- Rail lamps (if equipped)
- Glove compartment lamp assembly
- Dimmer switch
- Illuminated vanity mirrors (if equipped)
- Rear cargo lamp
- Puddle lamps (if equipped)
- Door ajar switches
- Liftgate glass ajar switch

The interior lighting system consists of 2 subsystems:

- Courtesy lamps
- Demand lamps

The courtesy lamps are controlled by the SJB. The courtesy lamp subsystem consists of the ajar switches, the interior dome lamps, the puddle lamps, the roof rail lamps, the cargo lamp, and the overhead console lamps (if equipped). The SJB supplies voltage to the courtesy lamps when the SJB receives the required input.

The demand lamps subsystem consists of the glove compartment lamp, the dimmer switch, the cargo lamp, all map/reading lamps, the roof rail lamps, and the LH and RH vanity mirror lamps.

The SJB supplies power to the interior lighting system. The SJB sets DTCs if certain circuit failures exist with the interior lighting system.

Interior Lighting

Printable View (304 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communications Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

The smart junction box (SJB) supplies voltage to the interior lighting system. The interior lighting system illuminates the courtesy lamps while a vehicle door is open or ajar, and the vehicle speed is less than 15 km/h (9 mph) or 5 km/h (3 mph) for puddle lamps. The SJB controls all interior lighting functions and timing by monitoring inputs from the door ajar switches, the dimmer switch, and the vehicle speed.

Interior Lighting Delay

The interior lighting delay feature provides temporary illumination of the courtesy lamps after the doors are opened and then closed. The interior lighting delay feature keeps the courtesy lamps on for a period of 25 seconds. If during the 25-second delay time the SJB detects that the ignition has been turned to RUN, ACC, START, or if the vehicle is locked using the remote keyless entry (RKE) transmitter, the courtesy lamp illumination is discontinued.

Illuminated Entry

The illuminated entry requests the courtesy lamps to illuminate when the ignition is OFF and the RKE transmitter UNLOCK button is pressed. The illuminated entry requests the courtesy lamps off after 25 seconds have elapsed, the ignition is switched to ON, or when the RKE transmitter LOCK button is pressed.

Illuminated Exit

The illuminated exit requests the courtesy lamps illuminate for 25 seconds when all doors are closed and the ignition key is removed from the ignition lock cylinder. The illuminated exit deactivates when any door becomes ajar, the ignition key is inserted into the ignition lock cylinder, or 25 seconds have elapsed.

Theater Lighting

The theater lighting option ramps-up the courtesy lamps over 0.7 second when courtesy lamp activation is requested. The theater lighting feature ramps-down the courtesy lamps over 1.7 seconds when interior lighting deactivation is requested by any feature other than the panic alarm or the battery saver.

Interior Lamp Arbitrator

The interior lamp arbitrator (located in the SJB) chooses between the interior lighting, the interior mode, the interior lighting delay, the illuminated entry, the illuminated exit, the battery saver, and the alarm flash processing to determine which feature has precedence of activating and deactivating the interior lamps. The features are prioritized as follows: alarm flash processing, battery saver, interior mode, interior lighting, interior light delay, illuminated entry, and illuminated exit.

Battery Saver

The battery saver is internal to the SJB and provides automatic shut-off of the demand lamps (cargo lamp, vanity lamps, map lamps and glove compartment lamp) and courtesy lamps after a time-out period in order to save battery voltage. A timer in the SJB is started when the ignition is turned to the OFF position. When the time-out period for the lamps has elapsed, the voltage is automatically shut off to the lamps by the battery saver. While the battery saver has voltage disabled, if the ignition is turned to any position other than OFF, any door becomes ajar, or the UNLOCK button of the RKE transmitter is pressed, the battery saver restores voltage and starts the timer again.

NOTE: Time out is 1 minute if the vehicle has less than 80 km (50 miles).

The battery saver time-outs are as follows:

- Courtesy lamps, if the dome lamp is off or the liftgate/liftglass is closed = 10 minutes
- Courtesy lamps, if the dome lamp is on or the liftgate/liftglass is open, demand lamps = 30 minutes

The SJB utilizes a protective circuit strategy for many of its outputs (for example, the headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault is detected. A continuous DTC is stored at that time for the fault. The circuit will then reset after a customer demand of the function (switching the component on, 30-minute battery saver being energized). When an excessive circuit load occurs several times, the module shuts down the output until a repair procedure is carried out. At the same time, the continuous DTC that was stored on the first failure will not clear by a command to clear the continuous DTCs. The module will not allow this code to be cleared or the circuit restored to normal until a successful on-demand self-test proves that the fault has been repaired. After the on-demand self-test has successfully completed (no on-demand DTCs present), the continuous DTC will have been cleared and the circuit function will return.

The SJB field-effect transistor (FET) protected output circuits for the interior lighting system are for the puddle lamps and interior lamp output circuits.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Courtesy lamps
• Map lamps
• Vanity lamps
• Door ajar switches
	• Smart junction box (SJB) fuse(s):
	  ▪ 9 (15A)
	  ▪ 10 (15A)
	  ▪ 25 (10A)
	• Circuitry
	• Courtesy lamps
	• Map lamps
	• Cargo lamps
	• Vanity lamps
	• Glove compartment lamp
	• Dimmer switch
	• SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool release software.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.

9. If the DTCs retrieved are related to the concern, go to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart or the Power Liftgate Module Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1320	Driver Door Ajar Circuit Open	Go To Pinpoint Test C .
B1328	Passenger Door Ajar Circuit Open	Go To Pinpoint Test C .

B1331	Decklid Ajar Rear Door Circuit Failure	Go To Pinpoint Test C .

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Circuitry • SJB	• REFER to Section 418-00 .
• The courtesy lamps flash on and off	• The SJB is not configured correctly.	• CONFIGURE the SJB. REFER to Section 418-01 .
• The courtesy lamps are inoperative	• Fuse • Circuitry • Dimmer switch	• Go To Pinpoint Test A .

	• SJB	
• An individual courtesy lamp is inoperative	• Circuitry • Interior lamp	• Go To Pinpoint Test B.
• The courtesy lamps stay on continuously	• Circuitry • Ajar switch • Liftgate ajar switch • Liftgate glass ajar switch • Dimmer switch • Power liftgate module • SJB	• Go To Pinpoint Test C.
• The courtesy lamps do not turn on with one door open	• Circuitry • Ajar switch • SJB	• Go To Pinpoint Test D.
• The courtesy lamps do not turn on with the liftgate or liftgate glass open	• Circuitry • Ajar switch • Liftgate ajar switch • Liftgate glass ajar switch • Power liftgate module • SJB	• Go To Pinpoint Test H.
• The demand lamps are inoperative	• Fuse • Circuitry • SJB	• Go To Pinpoint Test E.
• An individual demand lamp is inoperative	• Circuitry • Interior lamp	• Go To Pinpoint Test F.
• The illuminated entry is inoperative when using the remote keyless entry (RKE) transmitter	• RKE system • SJB	• Go To Pinpoint Test G.
• The battery saver does not deactivate after time-out	• Circuitry • SJB	• Go To Pinpoint Test I.
• The puddle lamps are inoperative	• Fuse • Circuitry • Exterior mirror • SJB	• Go To Pinpoint Test J.
• The puddle lamps stay on continuously	• Circuitry • SJB	• Go To Pinpoint Test L.
• The courtesy lamps are inoperative from the dimmer switch	• Circuitry • Dimmer switch • SJB	• Go To Pinpoint Test K.

Pinpoint Tests

Pinpoint Test A: The Courtesy Lamps Are Inoperative

Refer to Wiring Diagrams Cell 89, Interior Lamps for schematic and connector information.

Normal Operation

Power is supplied to the courtesy lamps through the smart junction box (SJB) fuse 9 (15A), which supplies voltage to the courtesy lamps/demand lamps solid-state relay in the SJB. When any door is opened, the ajar switch opens, signaling the SJB. The SJB monitors the ajar circuits, and based on the ajar status, the SJB energizes the solid-state relay supplying voltage to the courtesy lamps on circuit VLN33 (GY/VT). The SJB also monitors the dome defeat output through circuit VLN36 (GY/OG). A short to ground on circuit VLN36 (GY/OG) will cause the courtesy lamps to be inoperative. Ground for the courtesy lamps is supplied through circuit GD150 (BK/WH).

DTC B2A35 — is an on-demand DTC that sets when the SJB detects an open from the interior lighting circuit.

DTC B2A36 — is a continuous and on-demand DTC that sets when the SJB detects a short to ground from the interior lighting circuit.

Possible Causes

- Fuse
- Circuit VLN33 (GY/VT) open or short to ground
- Circuit VLN36 (GY/OG) short to ground
- Circuit GD150 (BK/WH) open
- Dimmer switch
- SJB

PINPOINT TEST A: THE COURTESY LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
A1 CHECK THE SJB DTCs FROM BOTH THE CONTINUOUS AND THE ON-DEMAND SELF-TESTS	
• Use the recorded results from the SJB continuous and on-demand self-test. • **Are any SJB DTCs recorded?**	**Yes** For DTC B2A35, GO to A2. For DTC B2A36, GO to A4. For all other DTCs, REFER to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to A2.
A2 CHECK THE OPERATION OF THE DEMAND LIGHTING	
• Operate the demand lighting function on any interior lamp. • **Does the interior lamp illuminate?**	**Yes** GO to A3. **No** REPAIR circuit GD150 (BK/WH) for an open. CLEAR the DTCs. REPEAT the self-test.
A3 CHECK CIRCUIT VLN33 (GY/VT) FOR AN OPEN	
• Key in OFF position. • Disconnect: SJB C2280f.	**Yes** VERIFY the SJB fuse 9 (15A) is OK.

• Connect a fused (10A) jumper wire between the SJB C2280f-9, circuit VLN33 (GY/VT), harness side and battery positive.  N0056176 • **Do the courtesy lamps illuminate?**	If OK, GO to A5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A4 CHECK THE DIMMER CONTROL SWITCH	
• Key in OFF position. • Disconnect: Dimmer Switch C2065. • Key in ON position. • Measure the voltage between the dimmer switch C2065-2, circuit VLN36 (GY/OG), harness side and ground.  N0037306 • **Is the voltage greater than 10 volts?**	**Yes** GO to A5 . **No** INSTALL a new dimmer control switch. REFER to Section 413-00 . TEST the system for normal operation.
A5 CHECK CIRCUIT VLN36 (GY/OG) FOR A SHORT TO GROUND	
• Key in OFF position. • Connect: Dimmer Switch C2065 . • Disconnect: SJB C2280g. • Measure the resistance between the SJB C2280g-36, circuit VLN36 (GY/OG), harness side and ground.  N0057325 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A6 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
A6 CHECK CIRCUIT VLN33 (GY/VT) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: SJB C2280f.	**Yes** GO to A7 .

• Disconnect: All Interior Lamps. • Measure the resistance between the SJB C2280f-9, circuit VLN33 (GY/VT), harness side and ground.  N0056177 • **Is the resistance greater than 10,000 ohms?**	**No** REPAIR the circuit. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
A7 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.

Pinpoint Test B: An Individual Courtesy Lamp Is Inoperative

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

Circuit VLN33 (GY/VT) provides voltage to each courtesy lamp when activated. The courtesy lamps are grounded through circuit GD150 (BK/WH).

Possible Causes

- Circuit VLN33 (GY/VT) open
- Circuit GD150 (BK/WH) open
- Interior lamp

PINPOINT TEST B: AN INDIVIDUAL COURTESY LAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
B1 CHECK THE INTERIOR LAMP	
• Key in OFF position.	**Yes**

- Disconnect: Suspect Interior Lamp.
- Open the driver door.
- Measure the voltage between the suspect interior lamp pins, harness side as follows:

Location	Connector-Pin/ Circuit	Connector-Pin/ Circuit
Front interior/map lamp (without overhead console)	C931-1 VLN33 (GY/VT)	C931-2 GD150 (BK/WH)
Front interior/map lamp (with overhead console)	C929-2 VLN33 (GY/VT)	C929-1 GD150 (BK/WH)
Cargo lamp	C926-1 VLN33 (GY/VT)	C926-2 GD150 (BK/WH)
RH rail lamp	C942-2 VLN33 (GY/VT)	C942-1 GD150 (BK/WH)
LH rail lamp	C941-2 VLN33 (GY/VT)	C941-1 GD150 (BK/WH)

- **Is the voltage greater than 10 volts?**

INSTALL a new interior lamp for the lamp in question. TEST the system for normal operation.

No
GO to B2 .

B2 CHECK CIRCUIT VLN33 (GY/VT) FOR VOLTAGE

- Measure the voltage between the suspect interior lamp, circuit VLN33 (GY/VT), harness side and ground as follows:

Location	Connector-Pin
Front interior/map lamp (without overhead console)	C931-1
Front interior/map lamp (with overhead console)	C929-2
Cargo lamp	C926-1
RH rail lamp	C942-2
LH rail lamp	C941-2

- **Is the voltage greater than 10 volts?**

Yes
REPAIR circuit GD150 (BK/WH) for an open. TEST the system for normal operation.

No
REPAIR circuit VLN33 (GY/VT) for an open. TEST the system for normal operation.

Pinpoint Test C: The Courtesy Lamps Stay On Continuously

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Retractable Running Boards for schematic and connector information.

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

When any door, liftgate, or liftgate glass is opened, the ajar switch or the power liftgate module opens the circuit to the smart junction box (SJB). The SJB monitors the ajar circuits, and based on the ajar status, the SJB supplies voltage to the courtesy lamps on circuit VLN33 (GY/VT).

DTC B1320 — is an on-demand DTC that sets when the SJB detects an open from the driver door ajar circuit.

DTC B1328 — is an on-demand DTC that sets when the SJB detects an open from the passenger door ajar circuit.

DTC B1331 — is an on-demand DTC that sets when the SJB detects an open from the liftgate or the liftgate glass ajar circuit.

DTC B1336 — is an on-demand DTC that sets when the SJB detects an open from the RR door ajar circuit.

DTC B1572 — is an on-demand DTC that sets when the SJB detects an open from the LR door ajar circuit.

DTC B1688 — is an on-demand DTC that sets when the SJB detects a short to ground from the dimmer switch circuit.

DTC B2077 — is an on-demand DTC that sets when the SJB detects an open from the liftgate glass or the liftgate ajar circuit.

DTC B2A35 — is an on-demand DTC that sets when the SJB detects an open or a short to voltage from the courtesy lamp circuit.

DTC B2718 — is a continuous and on-demand DTC that sets when the power liftgate module detects a short to voltage from the SJB, the liftgate glass, or the liftgate ajar circuit.

DTC B2721 — is a continuous and on-demand DTC that sets when the power liftgate module detects an open from the SJB, or the liftgate ajar circuit.

DTC B2723 — is an on-demand DTC that sets when the power liftgate module detects an open from the liftgate glass ajar circuit.

Possible Causes

- Circuit CPL10 (GN/WH) open
- Circuit CPL26 (GN/VT) open
- Circuit CLN28 (GN/BU) short to ground
- Circuit CPL31 (WH) open
- Circuit CPL36 (GN) open
- Circuit CPL39 (YE) open
- Circuit CPL58 (GY/OG) open
- Circuit GD138 (BK/WH) open
- Circuit GD143 (BK/VT) open
- Circuit GD150 (BK/WH) open
- Circuit VLN33 (GY/VT) short to voltage
- Dimmer switch
- Ajar switch
- Liftgate ajar switch
- Liftgate glass ajar switch
- Power liftgate module
- SJB

PINPOINT TEST C: THE COURTESY LAMPS STAY ON CONTINUOUSLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>C1 CHECK THE SJB DTCs FROM BOTH THE CONTINUOUS AND THE ON-DEMAND SELF-TESTS</td><td></td></tr>

GO to C10 .
C10 CHECK CIRCUIT CPR50 (BN/BU) FOR AN OPEN (MANUAL LIFTGATE)	
• Connect: Liftgate Glass Ajar Switch C4040. • Disconnect: Liftgate Ajar Switch C457. • **NOTE:** Make sure the liftgate glass is closed. • Measure the resistance between the liftgate ajar switch C457-3, circuit CPR50 (BN/BU), harness side and ground.	**Yes** GO to C11 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0057308 • **Is the resistance less than 5 ohms?**	
C11 CHECK THE LIFTGATE AJAR SWITCH (MANUAL LIFTGATE)	
• Connect a fused (5A) jumper wire between the liftgate ajar switch C457-4, circuit CPL58 (GY/OG), harness side and the liftgate ajar switch C457-3, circuit CPR50 (BN/BU), harness side.  N0057309 • **Do the courtesy lamps turn off?**	**Yes** INSTALL a new liftgate ajar switch. REFER to Section 501-14 . CLEAR the DTCs. REPEAT the self-test. **No** REMOVE the jumper wire. GO to C12 .
C12 CHECK CIRCUIT CPL58 (GY/OG) FOR AN OPEN (MANUAL LIFTGATE)	
• Key in OFF position. • Connect: Liftgate Ajar Switch C457. • Disconnect: SJB C2280d. • **NOTE:** Make sure the liftgate is closed. • Measure the resistance between the SJB C2280d-16, circuit CPL58 (GY/OG), harness side and ground.  N0057310 • **Is the resistance less than 5 ohms?**	**Yes** GO to C19 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C13 CHECK THE POWER LIFTGATE MODULE DTCs FROM BOTH THE CONTINUOUS AND THE ON-DEMAND SELF-TESTS	
• Use the recorded results from the power liftgate module continuous and the on-demand self-test. • **Are any power liftgate module DTCs recorded?**	**Yes** For DTCs B2718 or B2721, GO to C14 . For DTC B2723, GO to C16 .

	No GO to C19 .
C14 CHECK THE POWER LIFTGATE MODULE	
• Disconnect: Power Liftgate Module C4174b. • **NOTE:** If the fuse fails, repair the circuit for a short to voltage. • Connect a fused (5A) jumper wire between the power liftgate module C4174b-2, circuit CPL58 (GY/OG), harness side and ground.  N0058813 • **Do the courtesy lamps turn off?**	**Yes** GO to C20 . **No** LEAVE the jumper wire connected. GO to C15 .
C15 CHECK CIRCUIT CPL58 (GY/OG) FOR AN OPEN	
• Key in OFF position. • Disconnect: SJB C2280d. • Measure the resistance between the SJB C2280d-16, circuit CPL58 (GY/OG), harness side and ground.  N0057310 • **Is the resistance less than 5 ohms?**	**Yes** GO to C19 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C16 CHECK CIRCUIT GD150 (BK/WH) FOR AN OPEN (POWER LIFTGATE)	
• Key in OFF position. • Disconnect: Liftgate Glass Ajar Switch C4040. • Measure the resistance between the liftgate glass ajar switch C4040-3, circuit GD150 (BK/WH), harness side and ground.  N0057294 • **Is the resistance less than 5 ohms?**	**Yes** GO to C17 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C17 CHECK THE LIFTGATE GLASS AJAR SWITCH	

• Connect a fused (5A) jumper wire between the liftgate glass ajar switch C4040-1, circuit CPR50 (BN/BU), harness side and the liftgate glass ajar switch C4040-3, circuit GD150 (BK/WH), harness side.  N0057295 • **Do the courtesy lamps turn off?**	**Yes** INSTALL a new liftgate glass ajar switch. REFER to Section 501-14 . CLEAR the DTCs. REPEAT the self-test. **No** REMOVE the jumper wire. GO to C18 .
C18 CHECK CIRCUIT CPR50 (BN/BU) FOR AN OPEN	
• Key in OFF position. • Connect: Liftgate Glass Ajar Switch C4040. • Disconnect: Power Liftgate Module C4174b. • **NOTE:** Make sure the liftgate glass is closed. • Measure the resistance between the power liftgate module C4174b-18, circuit CPR50 (BN/BU), harness side and ground.  N0058814 • **Is the resistance less than 5 ohms?**	**Yes** GO to C20 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C19 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

C20 CHECK FOR CORRECT POWER LIFTGATE MODULE OPERATION	

• Disconnect all the power liftgate module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the power liftgate module connectors and make sure they seat correctly.
	Yes
	INSTALL a new power liftgate module. REFER to Section 501-03 . TEST the system for normal operation.

• Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The Courtesy Lamps Do Not Turn On With One Door Open

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

When any door is opened, the ajar switch opens the circuit to the smart junction box (SJB). The SJB monitors the ajar circuits, and based on the ajar status, the SJB will supply voltage to the courtesy lamps on circuit VLN33 (GY/VT).

Possible Causes

- Circuit CPL26 (GN/VT) short to ground
- Circuit CPL31 (WH) short to ground
- Circuit CPL36 (GN) short to ground
- Circuit CPL39 (YE) short to ground
- Ajar switch
- SJB

PINPOINT TEST D: THE COURTESY LAMPS DO NOT TURN ON WITH ONE DOOR OPEN

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
D1 CHECK THE SJB DTCs FROM BOTH THE CONTINUOUS AND THE ON-DEMAND SELF-TESTS	
• Verify all the doors are closed. • Use the recorded results from the SJB continuous and the on-demand self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to D2 .
D2 CHECK THE DOOR AJAR PIDs	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: SJB PID. • Check the ajar SJB PID while opening and closing all the doors. • **Do all the door ajar PID values agree with the door positions?**	**Yes** GO to D5 . **No** GO to D3 .
D3 CHECK THE AJAR SWITCH OPERATION	

<table>
<tr><td>

- Disconnect: Suspect Ajar Switch .
- **Do the courtesy lamps illuminate?**

</td><td>

Yes
INSTALL a new ajar switch in question. REFER to Section 501-14 . TEST the system for normal operation.

No
GO to D4 .

</td></tr>
<tr><td>

D4 CHECK THE AJAR SWITCH CIRCUIT FOR A SHORT TO GROUND

- Disconnect: SJB C2280d.
- Measure the resistance between the suspect ajar switch, harness side and ground as follows:

Location	Connector-Pin	Circuit
LH front	C526-2	CPL26 (GN/VT)
RH front	C602-2	CPL31 (WH)
LH rear	C715-2	CPL36 (GN)
RH rear	C820-2	CPL36 (GN)

- **Is the resistance greater than 10,000 ohms?**

</td><td>

Yes
GO to D5 .

No
REPAIR the circuit in question. TEST the system for normal operation.

</td></tr>
<tr><td>

D5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

</td><td>

Yes
INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

</td></tr>
</table>

Pinpoint Test E: The Demand Lamps Are Inoperative

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) supplies voltage to the demand lamps on circuit CLN09 (YE/GN). The demand lamps are grounded through circuit GD150 (BK/WH).

Possible Causes

- Fuse
- Circuit CLN09 (YE/GN) open or short to ground
- Circuit GD150 (BK/WH) open
- SJB

PINPOINT TEST E: THE DEMAND LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
E1 CHECK CIRCUIT CLN09 (YE/GN) FOR AN OPEN	**Yes** VERIFY the SJB fuse 25 (10A) is OK. If OK, GO to E2 . **No** REPAIR the circuit. TEST the system for normal operation.
• Key in OFF position. • Disconnect: SJB C2280e. • **NOTE:** If the fuse fails, repair circuit CLN09 (YE/GN) for a short to ground. • Connect a fused (10A) jumper wire between the SJB C2280e-21, circuit CLN09 (YE/GN), harness side and battery positive.  N0056178 • **Do the demand lamps illuminate when switched on?**	
E2 CHECK THE OPERATION OF THE COURTESY LIGHTING	**Yes** GO to E3 . **No** REPAIR circuit GD150 (BK/WH) for an open. CLEAR the DTCs. REPEAT the self-test.
• Open the driver door. • **Do the courtesy lamps illuminate?**	
E3 CHECK FOR CORRECT SJB OPERATION	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**	

Pinpoint Test F: An Individual Demand Lamp Is Inoperative

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) supplies voltage to the demand lamps on circuit CLN09 (YE/GN). The demand lamps are grounded through circuit GD150 (BK/WH). The glove compartment lamp is grounded through circuit GD138 (BK/WH).

Possible Causes

- Circuit CLN09 (YE/GN) open
- Circuit GD150 (BK/WH) open

- Circuit GD138 (BK/WH) open
- Interior lamp

PINPOINT TEST F: AN INDIVIDUAL DEMAND LAMP IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>

LH rail lamp	C941-1	GD150 (BK/WH)
Glove compartment lamp	C254-2	GD138 (BK/WH)

- **Is the resistance less than 5 ohms?**

Pinpoint Test G: The Illuminated Entry Is Inoperative When Using The Remote Keyless Entry (RKE) Transmitter

Normal Operation

The illuminated entry provides interior lighting whenever the smart junction box (SJB) receives a door unlock request from the RKE transmitter. The SJB provides voltage on circuit VLN33 (GY/VT) for the courtesy lamps.

Possible Causes

- RKE system
- SJB

PINPOINT TEST G: THE ILLUMINATED ENTRY IS INOPERATIVE WHEN USING THE REMOTE KEYLESS ENTRY (RKE) TRANSMITTER

Test Step	Result / Action to Take
G1 CHECK FOR CORRECT RKE OPERATION	
• Using the RKE transmitter, lock and unlock the doors. • **Do the doors lock and unlock?**	**Yes** GO to G2 . **No** REFER to Section 501-14 .
G2 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 .
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test H: The Courtesy Lamps Do Not Turn On With the Liftgate Or The Liftgate Glass

Open

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Retractable Running Boards for schematic and connector information.

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

When the liftgate or the liftgate glass is opened, the ajar switch opens the circuit to the smart junction box (SJB). The SJB monitors the ajar circuits, and based on the ajar status, the SJB will supply voltage to the courtesy lamps on circuit VLN33 (GY/VT).

DTC B2721 — sets when the power liftgate module detects a short to ground from the SJB, or liftgate ajar circuit.

Possible Causes

- Circuit CPL58 (GY/OG) short to ground
- Circuit CPR50 (BN/BU) short to ground
- Ajar switch
- Liftgate ajar switch
- Liftgate glass ajar switch
- Power liftgate module
- SJB

PINPOINT TEST H: THE COURTESY LAMPS DO NOT TURN ON WITH THE LIFTGATE OR THE LIFTGATE GLASS OPEN

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
H1 CHECK THE LIFTGATE TYPE	
• Identify the vehicle liftgate type. • **Is the vehicle equipped with a power liftgate?**	**Yes** GO to H2 . **No** GO to H8 .
H2 CHECK THE POWER LIFTGATE MODULE DTCs FROM BOTH THE CONTINUOUS AND THE ON-DEMAND SELF-TESTS	
• Use the recorded results from the power liftgate module continuous and the on-demand self-test. • **Is DTC B2721 recorded?**	**Yes** GO to H3 . **No** GO to H5 .
H3 CHECK THE POWER LIFTGATE MODULE	
• Key in OFF position. • Disconnect: Power Liftgate Module C4174b. • **Do the courtesy lamps illuminate?**	**Yes** GO to H13 . **No** GO to H4 .

H4 CHECK CIRCUIT CPL58 (GY/OG) FOR A SHORT TO GROUND	
• Disconnect: SJB C2280d. • Measure the resistance between the SJB C2280d-16, circuit CPL58 (GY/OG), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H12 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
H5 CHECK THE LIFTGATE GLASS AJAR PID	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Power Liftgate Module PID. • Monitor the power liftgate module liftgate glass ajar PID while opening and closing the liftgate glass. • **Do the liftgate glass ajar PID values agree with the liftgate glass ajar positions?**	**Yes** GO to H13 . **No** GO to H6 .
H6 CHECK THE LIFTGATE GLASS AJAR SWITCH (POWER LIFTGATE)	
• Disconnect: Liftgate Glass Ajar Switch C4040. • **Do the courtesy lamps illuminate?**	**Yes** INSTALL a new liftgate glass ajar switch. REFER to Section 501-14 . TEST the system for normal operation. **No** GO to H7 .
H7 CHECK CIRCUIT CPR50 (BN/BU) FOR A SHORT TO GROUND (POWER LIFTGATE)	
• Key in OFF position. • Disconnect: Power Liftgate Module C4174b. • Measure the resistance between the power liftgate module C4174b-18, circuit CPR50 (BN/BU), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H13 . **No** REPAIR the circuit. TEST the system for normal operation.
H8 CHECK THE LIFTGATE AND LIFTGATE GLASS AJAR SWITCH OPERATION (MANUAL LIFTGATE)	
• Key in OFF position.	**Yes**

• Disconnect: Liftgate Ajar Switch C457. • Disconnect: Liftgate Glass Ajar Switch C4040. • Measure the resistance between the suspect liftgate ajar switch connector pins, component side, while toggling the switch open and closed as follows: **Location** / **Connector-Pin** / **Connector-Pin** Liftgate ajar switch / C457-4 / C457-3 Liftgate glass ajar switch / C4040-1 / C4040-3 • **Is the resistance less than 5 ohms when the switch is closed and greater than 10,000 ohms when the switch is open?**	GO to H9 . **No** INSTALL a new liftgate or liftgate glass ajar switch for the switch in question. REFER to Section 501-14 . TEST the system for normal operation.
H9 CHECK THE SJB MODULE	
• Key in OFF position. • Disconnect: SJB C2280d. • Observe the courtesy lamps. • **Do the courtesy lamps operate with the SJB module disconnected?**	**Yes** GO to H12 . **No** GO to H10 .
H10 CHECK CIRCUIT CPR50 (BN/BU) FOR A SHORT TO GROUND	
• Measure the resistance between the liftgate ajar switch C457-3, circuit CPR50 (BN/BU), harness side and ground.  N0057308 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H11 . **No** REPAIR the circuit. TEST the system for normal operation.
H11 CHECK CIRCUIT CPL58 (GY/OG) FOR A SHORT TO GROUND	
• Measure the resistance between the SJB C2280d-16, circuit CPL58 (GY/OG), harness side and ground.  N0057310 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H12 . **No** REPAIR the circuit. TEST the system for normal operation.
H12 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for:	**Yes** INSTALL a new SJB. REFER

■ corrosion ■ damaged pins ■ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
H13 CHECK FOR CORRECT POWER LIFTGATE MODULE OPERATION	
• Disconnect all the power liftgate module connectors. • Check for: ■ corrosion ■ damaged pins ■ pushed-out pins • Connect all the power liftgate module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new power liftgate module. REFER to Section 501-03 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test I: The Battery Saver Does Not Deactivate After Time-Out

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) provides a battery saver function. The battery saver function provides automatic shutoff of the interior lamps (demand lamps, and glove compartment lamp) after a predetermined time has elapsed in order to save battery power.

Possible Causes

- Circuit CLN09 (YE/GN) short to voltage
- SJB

PINPOINT TEST I: THE BATTERY SAVER DOES NOT DEACTIVATE AFTER TIME-OUT

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
I1 CHECK CIRCUIT CLN09 (YE/GN) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: SJB C2280e. • Key in ON position. • Turn any demand lamp on. • **Does the demand lamp turn on?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to I2 .

I2 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 .
	TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test J: The Puddle Lamps are Inoperative

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) provides voltage to the puddle lamps through circuit CLN25 (VT). The puddle lamps have separate ground circuits. The LH exterior mirror is grounded through circuit GD143 (BK/VT), and the RH exterior mirror is grounded through circuit GD138 (BK/WH).

DTC B2A39 — sets when the SJB detects an open on the puddle lamp output circuit.

DTC B2A3A — sets when the SJB detects a short to ground on the puddle lamp output circuit.

Possible Causes

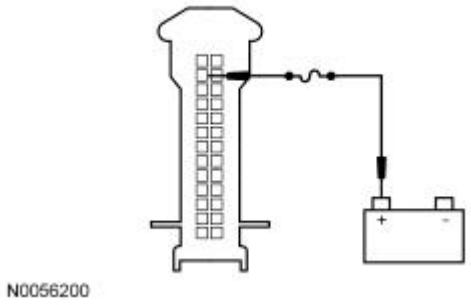
- Fuse
- Circuit CLN25 (VT) open or short to ground
- Circuit GD138 (BK/WH) open
- Circuit GD143 (BK/VT) open
- Exterior mirror
- SJB

PINPOINT TEST J: THE PUDDLE LAMPS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
J1 CHECK THE PUDDLE LAMP OPERATION	
• Observe the puddle lamps. • **Are both the puddle lamps inoperative?**	**Yes** GO to J2 . **No** GO to J3 .
J2 CHECK CIRCUIT CLN25 (VT) FOR AN OPEN	
• Key in OFF position. • Disconnect: SJB C2280d. • **NOTE:** If the fuse fails, repair circuit CLN25 (VT) for a short to ground.	**Yes** REMOVE the jumper wire. GO to J5 .

- Connect a fused (10A) jumper wire between the SJB C2280d-12, circuit CLN25 (VT), harness side and battery positive.



- **Do the puddle lamps illuminate?**

No
REPAIR the circuit. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.

J3 CHECK CIRCUIT CLN25 (VT) FOR AN OPEN

- Disconnect: Suspect Exterior Mirror.
- **NOTE:** The courtesy lamps must be active during this test.
- Open any door.
- Measure the voltage between the suspect exterior mirror connector, harness side and ground as follows:

Location	Connector-Pin	Circuit
RH exterior mirror	C622-11	CLN25 (VT)
LH exterior mirror	C516-11	CLN25 (VT)

- **Is the voltage greater than 10 volts?**

Yes
GO to J4 .

No
REPAIR the circuit. TEST the system for normal operation.

J4 CHECK THE GROUND CIRCUIT FOR AN OPEN

- Measure the resistance between the suspect exterior mirror connector, harness side and ground as follows:

Location	Connector-Pin	Circuit
RH exterior mirror	C622-2	GD138 (BK/WH)
LH exterior mirror	C516-2	GD143 (BK/VT)

- **Is the resistance less than 5 ohms?**

Yes
INSTALL a new exterior mirror in question. REFER to Section 501-09 . TEST the system for normal operation.

No
REPAIR the circuit in question. TEST the system for normal operation.

J5 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system

	for normal operation.

Pinpoint Test K: The Courtesy Lamps Are Inoperative From The Dimmer Control Switch

Refer to Wiring Diagrams Cell 89 , Interior Lighting for schematic and connector information.

Normal Operation

The smart junction box (SJB) monitors the dimmer switch status on circuit CLN28 (GN/BU) to determine if the courtesy lamps are requested. Based on the dimmer switch status, the SJB supplies voltage to the courtesy lamps through circuit CLN09 (YE/GN).

Possible Causes

- Circuit CLN28 (GN/BU) open or short to voltage
- Dimmer switch
- SJB

PINPOINT TEST K: THE COURTESY LAMPS ARE INOPERATIVE FROM THE DIMMER SWITCH

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
K1 CHECK THE PANEL ILLUMINATION OPERATION	
• Observe the panel illumination lamps while rotating the dimmer switch from the low to high position. • **Do the panel illumination lamps operate correctly?**	**Yes** GO to K2 . **No** REFER to Section 413-00 .
K2 CHECK THE DIMMER SWITCH	
• Key in OFF position. • Disconnect: Dimmer Switch C2065. • Connect a fused (2A) jumper wire between the dimmer switch C2065-5, circuit CLN28 (GN/BU), harness side and the dimmer switch C2065-4, circuit RLN29 (WH/OG), harness side.  N0037303 • **Do the courtesy lamps illuminate?**	**Yes** INSTALL a new dimmer switch. REFER to Section 413-00 . TEST the system for normal operation. **No** REMOVE the jumper wire. GO to K3 .
K3 CHECK CIRCUIT CLN28 (GN/BU) FOR AN OPEN	
• Disconnect: SJB C2280g. • Measure the resistance between the dimmer switch C2065-5, circuit CLN28 (GN/BU), harness side and the SJB C2280g-	**Yes** GO to K4 .

51, circuit CLN28 (GN/BU), harness side.  N0057291 • **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit. TEST the system for normal operation.
K4 CHECK CIRCUIT CLN28 (GN/BU) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between the dimmer switch C2065-5, circuit CLN28 (GN/BU), harness side and ground.  N0057292 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to K5 .
K5 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test I: The Puddle Lamps Stay On Continuously

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The smart junction box (SJB) provides voltage to the puddle lamps through circuit CLN25 (VT). The puddle lamps have separate ground circuits. The LH exterior mirror is grounded through circuit GD143 (BK/VT), and the RH exterior mirror is grounded through circuit GD138 (BK/WH).

DTC B2A39 — sets when the SJB detects a short to voltage on the puddle lamp output circuit.

Possible Causes

- Circuit CLN25 (VT) short to voltage
- SJB

PINPOINT TEST L: THE PUDDLE LAMPS STAY ON CONTINUOUSLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
L1 CHECK CIRCUIT CLN25 (VT) FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280d. • **Do the puddle lamps continue to illuminate?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to L2 .
L2 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Daytime Running Lamps (DRL)

Printable View (79 KB)

Expedition

NOTE: The smart junction box (SJB) must be configured when installing a new module. For additional information, refer to Section 418-01 .

The DRL system operates the low beam headlamps at a reduced intensity.

The SJB supplies pulse width modulated (PWM) voltage to illuminate the low beam headlamps at a reduced intensity when the following conditions are met:

- The ignition switch is in the RUN position.
- The headlamps have not been turned on by the autolamp system or the headlamp switch.
- The transmission is not in PARK (P).

Navigator

NOTE: The SJB must be configured when installing a new module. For additional information, refer to Section 418-01 .

The DRL system illuminates the fog lamps at full intensity.

The SJB energizes the fog lamp relay when the following conditions are met:

- The ignition switch is in the RUN position.
- The headlamps have not been turned on by the autolamp system or the headlamp switch.
- The transmission is not in PARK (P).

Daytime Running Lamps (DRL)

Printable View (89 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: When installing a new smart junction box (SJB), it must be configured for this feature, if originally equipped. Refer to Section 418-01 .

The SJB controls the DRL by using various inputs to determine whether or not the DRL should be illuminated. These inputs include:

- Ignition switch position
- Headlamp switch position
- Headlamps on or off
- Transmission gear selection

Inspection and Verification

1. Verify the customer concern by operating the daytime running lamps (DRL) following these steps:
   - Place the ignition switch in the RUN position.
   - Place the headlamp switch in the OFF position.
   - Place the transmission in any gear other than PARK (P).
   - If the DRL does not operate, make sure the SJB is configured for DRL before proceeding to the next step.

2. Carry out the continuous and on-demand self tests for the SJB.
   - If any DTCs are retrieved related to the concern, refer to Section 419-10 .
     - If no DTCs are retrieved, go to the next step.

3. For Expedition, verify the low beam operation.
   - Place the headlamp switch in the HEADLAMPS ON position.
     - If the low beams do not operate correctly, refer to Section 417-01 .
     - If the low beams operate correctly and the DRL operation is incorrect, proceed to the next step.

4. For Navigator, verify the fog lamp operation.
   - Place the ignition switch in the RUN position.
   - Place the headlamp switch in the HEADLAMPS ON position and engage the fog lamp switch.

- If the fog lamps do not operate correctly, refer to Section 417-01 .
- If the fog lamps operate correctly and the DRL operation is incorrect, proceed to the next step.

5. Check the SJB inputs.
   - Monitor the ignition switch, the headlamp switch input PIDs and the transmission gear status PIDs.
     - If the ignition switch PIDs do not agree with the ignition switch position, refer to Section 211-05 .
     - If the transmission gear status PIDs do not agree with the gear selector lever position, refer to Section 307-01A or Section 307-01B .
     - If the headlamp switch PIDs do not agree with the headlamp switch position, refer to Section 417-01 .
     - If the PIDs indicate correct ignition, headlamp switch and transmission gear status, install a new SJB. Refer to Section 419-10 . Test the system for normal operation.

Communications Network

Printable View (120 KB)

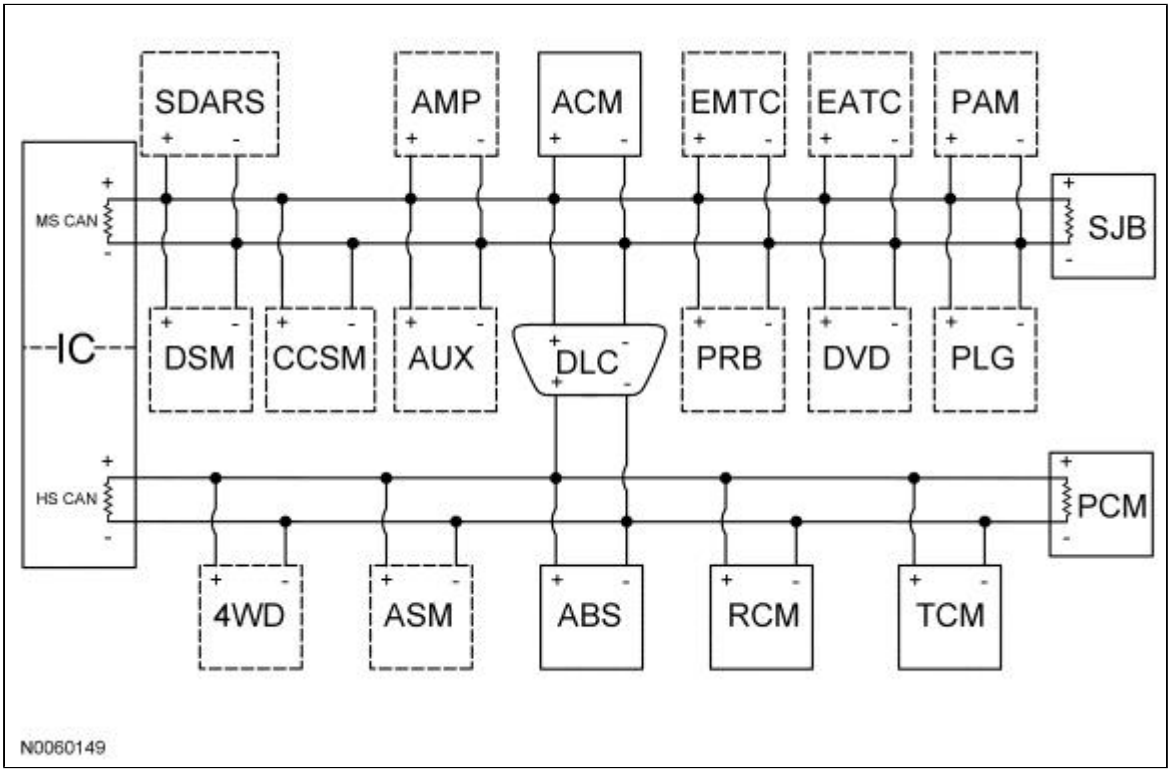
Vehicle communication utilizes both medium and high speed controller area network (CAN) communications. CAN is used for many modules to communicate with each other on a common network. CAN in-vehicle networking, is a method for transferring data among distributed electronic modules via a serial data bus. Without serial networking, intermodule communication requires dedicated, point to point wiring resulting in bulky, expensive, complex, and difficult to install wiring harnesses. Applying a serial data network reduces the number of wires combining the signals on a single network. Information is sent to the individual control modules that control each function.

The vehicle has 2 module communication networks:

- Medium speed (MS) CAN
- High speed (HS) CAN

Both networks are connected to the data link connector (DLC). This makes diagnosis and testing of these systems easier by allowing one scan tool to be able to diagnose and control any module on both networks from one connector. The DLC can be found under the instrument panel between the steering column and the audio unit.

Network Topology



Module Name	Network Type	Termination Module
Air suspension module (ASM) (if equipped)	HS-CAN	No
Audio control module (ACM)	MS-CAN	No
Auxiliary audio module (AUX) (if equipped)	MS-CAN	No

Anti-lock brake system (ABS) module	HS-CAN	No
Digital versatile disc (DVD) player (if equipped)	MS-CAN	No
Driver seat module (DSM) (if equipped)	MS-CAN	No
Electronic automatic temperature control (EATC) module (if equipped)	MS-CAN	No
Electronic manual temperature control module (if equipped)	MS-CAN	No
Climate controlled seat module (if equipped)	MS-CAN	No
Four wheel drive (4WD) control module (if equipped)	HS-CAN	No
Instrument cluster (IC) (gateway module)	HS-CAN MS-CAN	Yes Yes
Parking aid module (PAM) (if equipped)	MS-CAN	No
Power liftgate (PLG) module (if equipped)	MS-CAN	No
Power running board module (PRB) (if equipped)	MS-CAN	No
Powertrain control module (PCM)	HS-CAN	Yes
Restraints control module (RCM)	HS-CAN	No
Smart junction box (SJB)	MS-CAN	Yes
Satellite digital audio radio system (SDARS) (if equipped)	MS-CAN	No
THX® amplifier (AMP) (if equipped)	MS-CAN	No
Transmission control module (TCM) (if equipped)	HS-CAN	No

MS-CAN Network Operation

The MS-CAN network communicates using bussed messages. The MS-CAN has an unshielded twisted pair cable, data bus (+) and data bus (-) circuits. In addition to scan tool communication, this network allows sharing of information between all modules on the network.

The MS-CAN is a medium speed communication network used for the following modules:

- SJB
- Audio unit
- Instrument cluster
- DSM (if equipped)
- DVD player (if equipped)
- Electronic manual temperature control module (if equipped)
- EATC module (if equipped)
- SDARS module (if equipped)
- Parking aid module (if equipped)
- Power liftgate module (if equipped)
- Auxiliary audio module (if equipped)
- THX® amplifier (if equipped)
- Power running board module (if equipped)
- Climate controlled seat module (if equipped)

HS-CAN Network Operation

The HS-CAN network communicates using bussed messages. The HS-CAN network uses an unshielded twisted pair cable, data bus (+) and data bus (-) circuits. In addition to scan tool communication, this network allows sharing of information between all modules on the network.

The HS-CAN is a high speed communication network used for the following modules:

- PCM
- RCM
- ABS module
- Instrument cluster
- TCM (if equipped)
- 4WD control module (if equipped)
- Air suspension module (if equipped)

Network Termination

The CAN network uses a network termination circuit to improve communication reliability. The network termination of the CAN bus takes place inside the termination modules by termination resistors. Termination modules are located at either end of the bus network. As network messages are broadcast in the form of voltage signals, the network voltage signals are stabilized by the termination resistors. Each termination module has a 120 ohm resistor across the positive and negative bus connection in the termination module. With 2 termination modules on each network, and the 120 ohm resistors located in a parallel circuit configuration, the total network impedance, or total resistance is 60 ohms.

Network termination improves bus message reliability by:

- stabilizing bus voltage.
- eliminating electrical interference.

Gateway Module

The instrument cluster is the gateway module, translating HS-CAN to MS-CAN and vice versa. This information allows a message to be distributed throughout both networks. The instrument cluster is the only module on this vehicle that has this ability.

Communications Network

Printable View (836 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

Vehicle communication utilizes both medium and high speed controller area network (CAN) communications. CAN is a method for transferring data among distributed electronic modules via a serial data bus.

The vehicle is equipped with 2 module communication networks:

- Medium speed (MS) CAN
- High speed (HS) CAN

MS-CAN

The MS-CAN is a medium speed communication network that uses an unshielded twisted pair cable of data (+) and data (-) circuits. The data (+) and the data (-) circuits are each regulated to approximately 2.5 volts during neutral or rested network traffic. As bus messages are sent on the data (+) circuit, voltage is increased by approximately 1.0 volt. Inversely, the data (-) circuit is reduced by approximately 1.0 volt when a bus message is sent. Multiple bus messages can be sent over the network CAN circuits allowing multiple modules to communicate with each other. The MS-CAN network will not communicate while certain faults are present, but will operate with diminished performance with other faults present. The MS-CAN network may remain operational when 1 of the 2 termination resistors are not present.

The MS-CAN network operates at a maximum data transfer speed of 125 Kbps for bus messages and designed for general information transfer. The network will remain operational, but at a degraded level when certain circuit faults are present. The HS-CAN network may remain operational with only one termination resistor present.

The following modules are on the MS-CAN network:

- Smart junction box (SJB)
- Instrument cluster
- Audio unit
- THX® amplifier (if equipped)
- Satellite radio receiver (if equipped)
- Power running board module (if equipped)
- Parking aid module (if equipped)
- Power liftgate module (if equipped)
- Electronic manual temperature control module (if equipped)
- Electronic automatic temperature control (EATC) module (if equipped)
- Driver seat module (DSM) (if equipped)
- Climate controlled seat module (if equipped)
- Auxiliary audio module (if equipped)
- Digital versatile disc (DVD) player (if equipped)

The following fault chart describes the specific MS-CAN network failures and their resulting symptom:

MS-CAN Network Communication Fault Chart

Failure Description	Symptom
MS-CAN (+) shorted to MS-CAN (-)	No communication
MS-CAN (+) short to voltage	No communication
MS-CAN (-) short to voltage	No communication
MS-CAN (+) short to ground	No communication
MS-CAN (-) short to ground	Unreliable communication
MS-CAN (+) open	Unreliable communication
MS-CAN (-) open	Unreliable communication
Module loss of voltage or ground	No communication
Module internal failure	No communication

HS-CAN

The HS-CAN is a high speed communication network that uses an unshielded twisted pair cable of data (+) and data (-) circuits. The data (+) and the data (-) circuits are each regulated to approximately 2.5 volts during neutral or rested network traffic. As bus messages are sent on the data (+) circuit, voltage is increased by approximately 1.0 volt. Inversely, the data (-) circuit is reduced by approximately 1.0 volt when a bus message is sent. Multiple bus messages can be sent over the network CAN circuits allowing multiple modules to communicate with each other. The HS-CAN network will not communicate while certain faults are present, but will operate with diminished performance with other faults present. The HS-CAN bus may remain operational when 1 of the 2 termination resistors are not present.

The HS-CAN network operates at a maximum data transfer speed of 500 Kbps and is designed for real time information transfer and control. The network will remain operational, but at a degraded level when certain circuit faults are present. The HS-CAN network may remain operational with only one termination resistor present.

The following modules are on the HS-CAN network:

- Powertrain control module (PCM)

- Anti-lock brake system (ABS) module
- Restraints control module (RCM)
- Instrument cluster
- Transmission control module (TCM)
- Four wheel drive (4WD) control module (if equipped)
- Air suspension module (if equipped)

The following fault chart describes the specific HS-CAN network failures and their resulting symptom:

HS-CAN Network Communication Fault Chart

Failure Description	Symptom
HS-CAN (+) shorted to HS-CAN (-)	No communication
HS-CAN (+) short to voltage	No communication
HS-CAN (-) short to voltage	No communication
HS-CAN (+) short to ground	No communication
HS-CAN (-) short to ground	Unreliable communication
HS-CAN (+) open	Unreliable communication
HS-CAN (-) open	Unreliable communication
Module loss of voltage or ground	No communication
Module internal failure	No communication

The following chart describes the specific CAN network messages broadcast by each module, and the module(s) that receive the message:

CAN Network Module Communication Message Chart

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of electrical damage.

Visual Inspection Chart

Electrical

• Battery junction box (BJB) fuse(s):
  ▪ 7 (40A) (no communication with power running board module)
  ▪ 8 (40A) (no communication with climate controlled seat module)
  ▪ 35 (20A) (no communication with 4WD control module)
  ▪ 36 (10A) (no communication with PCM)
  ▪ 37 (15A) (no communication with TCM)
  ▪ 43 (20A) (no communication with 4WD control module)
  ▪ 45 (30A) (no communication with DSM)
  ▪ 47 (30A) (no communication with air suspension module)
  ▪ 65 (10A) (no communication with air suspension module)
  ▪ 73 (5A) (no communication with TCM)
  ▪ 76 (20A) (no communication with PCM)
  ▪ 77 (10A) (no communication with ABS module)
• Smart junction box (SJB) fuse(s):
  ▪ 2 (15A) (no communication with DSM)
  ▪ 3 (15A) (no communication with satellite radio receiver, auxiliary audio module, DVD)
  ▪ 5 (10A) (no communication with SJB)
  ▪ 14 (10A) (no communication with power liftgate module)
  ▪ 15 (10A) (no communication with electronic manual temperature control module, EATC module)
  ▪ 20 (15A) (no power to scan tool)
  ▪ 26 (10A) (no communication with instrument cluster)
  ▪ 27 (20A) (no communication with SJB)
  ▪ 28 (5A) (no communication with audio unit)
  ▪ 29 (5A) (no communication with instrument cluster)
  ▪ 32 (10A) (no communication with RCM)

    - 35 (10A) (no communication with parking aid module)
    - 37 (10A) (no communication with Electronic manual temperature control module, EATC module)
    - 38 (20A) (no communication with THX® amplifier)
    - 39 (20A) (no communication with audio unit)
    - 40 (20A) (no communication with THX® amplifier)
- Data link connector (DLC)
- Wiring harness
- Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the DLC.

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

If the scan tool does not communicate with the VCM:

- Check the VCM connection to the vehicle.
- Check the scan tool connection to the VCM.
- Go To Pinpoint Test W , to diagnose no power to the scan tool.

5. **NOTE:** During the network test, the scan tool will first attempt to communicate with the PCM, after establishing communication with the PCM, the scan tool will then attempt to communicate with all other modules on the vehicle.

   Carry out the network test.
   - If the network test passes, retrieve and record the continuous memory DTCs and proceed to Step 6.
   - If the network test fails, GO to Symptom Chart to identify the module not communicating.

6. If the DTCs retrieved are related to the concern, go to the Communication Network Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

7. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Communication Network Diagnostic Trouble Codes (DTC) Chart

NOTE: DTC U1900 will set in a module that is reporting a communication fault from another module on the data bus. The module that reports the fault is not the problem module.

DTC	Description	Source	Action
U0001	High Speed CAN Communication Bus Off	Anti-lock brake system (ABS) module	The module could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.
U0073	Control Module Communication Bus Off	Air suspension module	The module could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.
U0073	Control Module	Transmission	The module could not communicate on the

	Communication Bus Off	control module (TCM)	network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.
U0100	Lost Communication With ECM/PCM	ABS module	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test A .
U0100	Lost Communication With ECM/PCM	Air suspension module	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test A .
U0100	Lost Communication With ECM/PCM	Instrument cluster	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test A .
U0100	Lost Communication With ECM/PCM	TCM	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test A .
U0100	Lost Communication With ECM/PCM	Four wheel drive (4WD) control module	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test A .
U0101	Lost Communication With TCM	ABS module	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test B .
U0101	Lost Communication With TCM	Instrument cluster	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test B .
U0101	Lost Communication With TCM	4WD control module	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test B
U0102	Lost Communication With Transfer Case Control Module (4x4CM)	Instrument cluster	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test E .
U0102	Lost Communication With Transfer Case Control Module (4x4CM)	TCM	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test E .
U0114	Lost Communication With Four-Wheel Drive Control Module	ABS module	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test E .
U0121	Lost Communication With Anti-Lock Brake System (ABS) Control Module	Instrument cluster	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test C .
U0121	Lost Communication With Anti-Lock Brake System (ABS) Control Module	TCM	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test C .
U0121	Lost Communication With Anti-Lock Brake System (ABS) Control Module	4WD control module	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test C .
U0122	Lost Communication With Vehicle Dynamics Control Module	Instrument cluster	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, Go To Pinpoint Test F .

• The parking aid module does not respond to the scan tool	• Fuse • Circuitry • Parking aid module	• Go To Pinpoint Test S .
• The power liftgate module does not respond to the scan tool	• Fuse • Circuitry • Power liftgate module	• Go To Pinpoint Test T .
• No medium speed controller area network (MS-CAN) communication, all modules are not responding	• Circuitry • Audio unit • SJB • Instrument cluster • THX® amplifier (if equipped) • Satellite radio receiver (if equipped) • Climate controlled seat module (if equipped) • Auxiliary audio module (if equipped) • DVD player (if equipped) • DSM (if equipped) • Electronic manual temperature control module (if equipped) • EATC module (if equipped) • Parking aid module (if equipped) • Power running board module (if equipped) • Power liftgate module (if equipped)	• Go To Pinpoint Test U .
• No high speed controller area network (HS-CAN) communication, all modules are not responding	• Circuitry • PCM • ABS module • RCM • Instrument cluster • TCM • Air suspension module (if equipped) • 4WD control module (if equipped)	• Go To Pinpoint Test V .
• No power to the scan tool	• Fuse • Circuitry	• Go To Pinpoint Test W .

	• Scan tool	

Pinpoint Tests

Pinpoint Test A: The Powertrain Control Module (PCM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 25 , Electronic Engine Controls - 5.4L for schematic and connector information.

Normal Operation

The PCM communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the PCM. The PCM shares the HS-CAN network with the transmission control module (TCM), the anti-lock brake system (ABS) module, the restraints control module (RCM), the four wheel drive (4WD) control module (if equipped), the air suspension module (if equipped) and the instrument cluster.

DTC U0100 — sets in a module which had attempted to communicate with the PCM and failed.

Possible Causes

- Circuit VDB04 (WH/BU) open (HS-CAN +)
- Circuit VDB05 (WH) open (HS-CAN -)
- PCM

PINPOINT TEST A: THE POWERTRAIN CONTROL MODULE (PCM) DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
A1 POWERTRAIN CONTROL/EMISSIONS DIAGNOSIS (PC/ED) MANUAL PINPOINT TEST QA VERIFICATION CHECK	
• Verify that pinpoint test QA has been performed. • **Has pinpoint test QA been performed?**	**Yes** GO to A2 . **No** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual, Section 5, pinpoint test QA to diagnose no communication with the PCM.
A2 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Key in OFF position. • **NOTE:** Failure to disconnect the battery will result in false resistance readings. • Disconnect the battery ground cable.	**Yes** GO to A4 . **No**

• Measure the resistance between the data link connector (DLC) C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 54 and 66 ohms?**	GO to A3 .
A3 CHECK THE HS-CAN CIRCUITS BETWEEN THE DLC AND THE PCM FOR AN OPEN	
• Measure the resistance between the PCM C175b-2, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0026577 • Measure the resistance between the PCM C175b-3, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026578 • **Are the resistances less than 5 ohms?**	**Yes** GO to A4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
A4 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or

	corroded connector. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test B: The Transmission Control Module (TCM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 30 , Transmission Controls - 6HP26 for schematic and connector information.

Normal Operation

The TCM communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the TCM. The TCM shares the HS-CAN network with the powertrain control module (PCM), the anti-lock brake system (ABS) module, the restraints control module (RCM), the four wheel drive (4WD) control module (if equipped), the air suspension module (if equipped) and the instrument cluster. Voltage for the TCM is provided by circuits CBB73 (WH/BN) and SBB37 (GY/RD). Circuit GD113 (BK/YE) provides ground.

DTC U0101 — sets in a module which had attempted to communicate with the TCM and failed.

Possible Causes

- Fuse
- Circuit CBB73 (WH/BN) open
- Circuit GD113 (BK/YE) open
- Circuit SBB37 (GY/RD) open
- Circuit VDB04 (WH/BU) open (HS-CAN +)
- Circuit VDB05 (WH) open (HS-CAN -)
- TCM

PINPOINT TEST B: THE TRANSMISSION CONTROL MODULE (TCM) DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>B1 CHECK THE TCM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN</td><td></td></tr>
<tr><td>

Key in OFF position.
Disconnect: TCM C1548 (Expedition) or C1473 (Navigator).
Key in ON position.
Measure the voltage between the TCM, harness side and ground as follows:

<table>
<tr><th>Vehicle</th><th>TCM Connector-Pin</th><th>Circuit</th></tr>
<tr><td>Navigator</td><td>C1473-14</td><td>SBB37 (GY/RD)</td></tr>
<tr><td>Expedition</td><td>C1548-14</td><td>SBB37 (GY/RD)</td></tr>
</table>
</td><td>Yes
GO to B2 .

No
VERIFY that the battery junction box (BJB) fuse 37 (15A) or fuse 73 (5A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.</td></tr>
</table>

Navigator	C1473-9	CBB73 (WH/BN)
Expedition	C1548-9	CBB73 (WH/BN)

- **Are the voltages greater than 10 volts?**

B2 CHECK THE TCM GROUND CIRCUITS FOR AN OPEN

- Key in OFF position.
- Measure the resistance between the TCM, harness side and ground as follows:

Vehicle	TCM Connector-Pin	Circuit
Navigator	C1473-13	GD113 (BK/YE)
Expedition	C1548-13	GD113 (BK/YE)
Navigator	C1473-16	GD113 (BK/YE)
Expedition	C1548-16	GD113 (BK/YE)

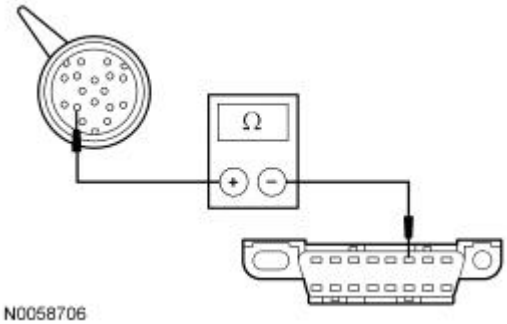
- **Are the resistances less than 5 ohms?**

Yes
GO to B3 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

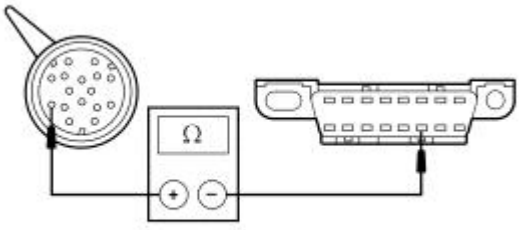
B3 CHECK THE HS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE TCM FOR AN OPEN

- Measure the resistance between the TCM C1473-6 (Navigator) or C1548-6 (Expedition), circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.



N0058706

- Measure the resistance between the TCM C1473-2 (Navigator) or C1548-2 (Expedition), circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.



N0058707

- **Are the resistances less than 5 ohms?**

Yes
GO to B4 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

B4 CHECK FOR CORRECT TCM OPERATION

- Disconnect the TCM connector.
- Check for:
  - corrosion
  - damaged pins

Yes
INSTALL a new TCM. REFER to Section 307-01A for the 6HP26 transmission or

▪ pushed-out pins • Connect the TCM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	Section 307-01B for the 6R75. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test C: The Anti-Lock Brake System (ABS) Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The ABS module communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the ABS module. The ABS module shares the HS-CAN network with the powertrain control module (PCM), the transmission control module (TCM), the restraints control module (RCM), the four wheel drive (4WD) control module (if equipped), the air suspension module (if equipped) and the instrument cluster. Voltage for the ABS module is provided by circuit CBB77 (WH), and ground is provided by circuit GD120 (BK/GN).

DTC U0121 — sets in a module which had attempted to communicate with the ABS control module and failed.

Possible Causes

- Fuse
- Circuit CBB77 (WH) open
- Circuit GD120 (BK/GN) open
- Circuit VDB04 (WH/BU) open (HS-CAN +)
- Circuit VDB05 (WH) open (HS-CAN -)
- ABS module

PINPOINT TEST C: THE ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
C1 CHECK THE ABS VOLTAGE SUPPLY CIRCUIT CBB77 (WH) FOR AN OPEN	
• Key in OFF position. • Disconnect: ABS Module C135.	**Yes** GO to C2 .

• Key in ON position. • Measure the voltage between the ABS module C135-8, circuit CBB77 (WH), harness side and ground.  N0060069 • **Is the voltage greater than 10 volts?**	**No** VERIFY the battery junction box (BJB) fuse 77 (10A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
C2 CHECK THE ABS GROUND CIRCUIT GD120 (BK/GN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the ABS module C135-16, circuit GD120 (BK/GN), harness side and ground.  N0057122 • **Is the resistance less than 5 ohms?**	**Yes** GO to C3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
C3 CHECK THE HS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE ABS MODULE FOR AN OPEN	
• Measure the resistance between the ABS module C135-12, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0057123 • Measure the resistance between the ABS module C135-13, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** GO to C4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

 • **Are the resistances less than 5 ohms?**	
C4 CHECK FOR CORRECT ABS MODULE OPERATION	

• Disconnect the ABS module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the ABS module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test D: The Restraints Control Module (RCM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The RCM communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the RCM. The RCM shares the HS-CAN network with the powertrain control module (PCM), the transmission control module (TCM), the anti-lock brake system (ABS) module, the four wheel drive (4WD) control module (if equipped), the air suspension module (if equipped) and the instrument cluster. Voltage for the RCM is provided by circuit CBP32 (GN/VT), and the RCM is case grounded.

DTC U0151 — sets in a module which had attempted to communicate with the RCM and failed.

Possible Causes

- Fuse
- Circuit CBP32 (GN/VT) open
- Circuit VDB04 (WH/BU) open (HS-CAN +)
- Circuit VDB05 (WH) open (HS-CAN -)
- Case ground open
- RCM

PINPOINT TEST D: THE RESTRAINTS CONTROL MODULE (RCM) DOES NOT RESPOND TO THE SCAN TOOL

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

Test Step	Result / Action to Take
D1 CHECK THE RCM CONNECTION • Key in OFF position. • Depower the SRS. Refer to Section 501-20B . • Disconnect: RCM C310a. • Disconnect: RCM C310b. • **Are RCM C310a pin 24 and RCM C310b pins 17 and 18 OK?**	**Yes** GO to D2 . **No** REPAIR the RCM connector pins as necessary. REPOWER the SRS. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
D2 CHECK THE RCM VOLTAGE SUPPLY CIRCUIT CBP32 (GN/VT) FOR AN OPEN • Deactivate the SRS. Refer to Section 501-20B . • Repower the SRS. Refer to Section 501-20B . • Key in ON position. • Measure the voltage between the RCM C310a-24, circuit CBP32 (GN/VT), harness side and ground.  N0037003 • **Is the voltage greater than 10 volts?**	**Yes** GO to D3 . **No** VERIFY the smart junction box (SJB) fuse 32 (10A) is OK. If OK, REPAIR the circuit. REACTIVATE the SRS. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
D3 CHECK THE RCM CASE GROUND • Key in OFF position. • Measure the resistance between the RCM case and a good chassis ground. • **Is the resistance less than 5 ohms?**	**Yes** GO to D4 . **No** REPAIR the RCM case ground as necessary. REACTIVATE the SRS. REFER to Section 501-20B .

	CLEAR the DTCs. REPEAT the network test with the scan tool.
D4 CHECK THE HS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE RCM FOR AN OPEN	
• Measure the resistance between the RCM C310b-18, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0057252 • Measure the resistance between the RCM C310b-17, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0057253 • **Are the resistances less than 5 ohms?**	**Yes** GO to D5 . **No** REPAIR the circuit in question. REACTIVATE the SRS. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
D5 CHECK FOR CORRECT RCM OPERATION	
• Disconnect all the RCM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the RCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new RCM. REACTIVATE the SRS. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. REACTIVATE the SRS. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test E: The Four Wheel Drive (4WD) Control Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 34 , Four Wheel Drive Systems for schematic and connector information.

Normal Operation

The 4WD control module communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the 4WD control module. The 4WD control module shares the HS-CAN with powertrain control module (PCM), the transmission control module (TCM), the anti-lock brake system (ABS) module, the restraints control module (RCM), the air suspension module (if equipped) and the instrument cluster. Voltage is supplied by circuits CBP35 (YE/GY), SBB35 (BU/RD) and SBB43 (BU/RD). Ground is supplied by circuits GD123 (BK/GY) and GD133 (BK).

DTC U0102 or DTC U0114 — sets in a module which had attempted to communicate with the 4WD control module and failed.

Possible Causes

- Fuse
- Circuit CBP35 (YE/GY) open
- Circuit GD123 (BK/GY) open
- Circuit GD133 (BK) open
- Circuit SBB35 (BU/RD) open
- Circuit SBB43 (BU/RD) open
- Circuit VDB04 (WH/BU) open (HS-CAN +)
- Circuit VDB05 (WH) open (HS-CAN -)
- 4WD control module

PINPOINT TEST E: THE FOUR WHEEL DRIVE (4WD) CONTROL MODULE DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>E1 CHECK THE 4WD CONTROL MODULE VOLTAGE SUPPLY CIRCUITS FOR AN OPEN</td><td rowspan="2">Yes
GO to E2 .

No
VERIFY the battery junction box (BJB) fuse 35 (20A) or fuse 43 (20A) is OK and the SJB fuse 35 (10A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.</td></tr>
<tr><td>• Key in OFF position.

• Key in ON position.
• Measure the voltage between the 4WD control module, harness side and ground as follows:

<table><tr><th>Connector-Pin</th><th>Circuit</th></tr><tr><td>C281a-8</td><td>CBP35 (YE/GY)</td></tr><tr><td>C281b-6</td><td>SBB43 (BU/RD)</td></tr><tr><td>C281b-7</td><td>SBB35 (BU/RD)</td></tr></table>• Are the voltages greater than 10 volts?</td></tr>
<tr><td>E2 CHECK THE 4WD CONTROL MODULE GROUND CIRCUITS FOR AN OPEN</td><td rowspan="2">Yes
GO to E3 .

No</td></tr>
<tr><td>• Key in OFF position.
• Measure the resistance between the 4WD control module, harness side and ground as follows:</td></tr>
</table>

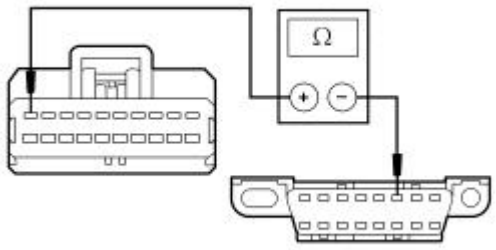
Connector-Pin	Circuit
C281b-3	GD133 (BK)
C281b-10	GD123 (BK/GY)

- **Are the resistances less than 5 ohms?**

REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

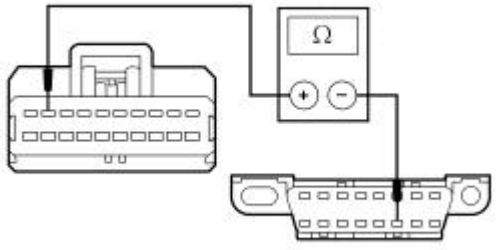
E3 CHECK THE HIGH SPEED CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE 4WD CONTROL MODULE FOR AN OPEN

- Measure the resistance between the 4WD control module C281a-10, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.



N0053241

- Measure the resistance between the 4WD control module C281a-9, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.



N0053242

- **Are the resistances less than 5 ohms?**

Yes
GO to E4 .

No
REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

E4 CHECK FOR CORRECT 4WD CONTROL MODULE OPERATION

- Disconnect all the 4WD control module connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the 4WD control module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a 4WD control module. REFER to Section 308-07A . CLEAR the DTCs. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test F: The Air Suspension Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 41 , Vehicle Dynamic Suspension for schematic and connector information.

Normal Operation

The air suspension module communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the air suspension module. The air suspension module shares the HS-CAN with powertrain control module (PCM), the transmission control module (TCM), the anti-lock brake system (ABS) module, the restraints control module (RCM), the four wheel drive (4WD) control module (if equipped) and the instrument cluster. Voltage for the air suspension module is provided by circuits CBB65 (WH/OG) and SBB47 (WH/RD). Circuits GD120 (BK/GN) and GD133 (BK) provide ground.

DTC U0122 — sets in a module which had attempted to communicate with the air suspension module and failed.

Possible Causes

- Fuse
- Circuit CBB65 (WH/OG) open
- Circuit SBB47 (WH/RD) open
- Circuit GD120 (BK/GN) open
- Circuit GD133 (BK) open
- Circuit VDB04 (WH/BU) open (HS-CAN +)
- Circuit VDB05 (WH) open (HS-CAN -)
- Air suspension module

PINPOINT TEST F: THE AIR SUSPENSION MODULE DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>

• Disconnect all the air suspension module connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the air suspension module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new air suspension module. REFER to Section 204-05 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test G: The Instrument Cluster Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The instrument cluster communicates with the scan tool through the high speed controller area network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the HS-CAN network connection to the instrument cluster and circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the MS-CAN network connection to the instrument cluster. The instrument cluster shares the HS-CAN network with the powertrain control module (PCM), the transmission control module (TCM), the anti-lock brake system (ABS) module, the restraints control module (RCM), the four wheel drive (4WD) control module (if equipped) and the air suspension module (if equipped). The instrument cluster shares the MS-CAN network with the smart junction box (SJB), the electronic manual temperature control module (if equipped), the electronic automatic temperature control (EATC) module (if equipped), the audio unit, the THX® amplifier (if equipped), the satellite radio receiver (if equipped), the driver seat module (DSM) (if equipped), the climate controlled seat module (if equipped), the power liftgate module (if equipped), the parking aid module (if equipped), the power running board module (if equipped), the auxiliary audio module and the digital versatile disc (DVD) player. Voltage for the instrument cluster is provided by circuits CBP29 (WH/VT) and SBP26 (YE/RD). Circuit GD133 (BK) provides ground.

DTC U0155 — sets in a module which had attempted to communicate with the instrument cluster and failed.

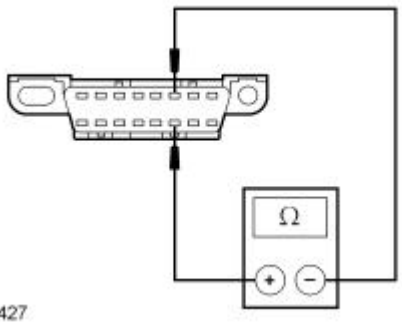
Possible Causes

- Fuse
- Circuit CBP29 (WH/VT) open
- Circuit GD133 (BK) open
- Circuit SBP26 (YE/RD) open
- Circuit VDB04 (WH/BU) open (HS-CAN +)
- Circuit VDB05 (WH) open (HS-CAN -)
- Instrument cluster

PINPOINT TEST G: THE INSTRUMENT CLUSTER DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
G1 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Key in OFF position. • **NOTE:** Failure to disconnect the battery will result in false resistance readings. • Disconnect the battery ground cable. • Disconnect the scan tool cable from the data link connector (DLC). • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** GO to G2 . **No** GO to G4 .



N0026427

- **Is the resistance between 54 and 66 ohms?**

G2 CHECK THE INSTRUMENT CLUSTER VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Disconnect: Instrument Cluster C220. • Connect the battery ground cable. • Key in ON position. • Measure the voltage between the instrument cluster, harness side and ground as follows: **Instrument Cluster Connector-Pin** / **Circuit** C220-1 / SBP26 (YE/RD) C220-14 / CBP29 (WH/VT) • **Are the voltages greater than 10 volts?**	**Yes** GO to G3. **No** VERIFY the smart junction box (SJB) fuse 26 (10A) or fuse 29 (5A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
G3 CHECK THE INSTRUMENT CLUSTER GROUND CIRCUIT GD133 (BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the instrument cluster C220-6, circuit GD133 (BK), harness side and ground.  N0057254 • **Is the resistance less than 5 ohms?**	**Yes** GO to G5. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
G4 CHECK THE HS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE INSTRUMENT CLUSTER FOR AN OPEN	
• Measure the resistance between the instrument cluster C220-7, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.	**Yes** GO to G5. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0009299 • Measure the resistance between the instrument cluster C220-8, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0057255 • **Are the resistances less than 5 ohms?**	
G5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test H: The Smart Junction Box (SJB) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 10 , Grounds for schematic and connector information.

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Normal Operation

The SJB communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the SJB. The SJB shares the MS-CAN network with the instrument cluster, the electronic

manual temperature control module (if equipped), the electronic automatic temperature control (EATC) module (if equipped), the audio unit, the THX® amplifier (if equipped), the satellite radio receiver (if equipped), the driver seat module (DSM) (if equipped), the climate controlled seat module (if equipped), the power liftgate module (if equipped), the parking aid module (if equipped), the power running board module (if equipped), the auxiliary audio module (if equipped) and the digital versatile disc (DVD) player (if equipped). Voltage for the SJB is provided by circuit CDC33 (VT/GN). Circuit GD133 (BK) provides ground.

DTC U0140 — sets in a module which had attempted to communicate with the SJB and failed.

Possible Causes

- Fuse
- Circuit CDC33 (VT/GN) open
- Circuit GD133 (BK) open
- Circuit VDB06 (GY/OG) open (MS-CAN +)
- Circuit VDB07 (VT/OG) open (MS-CAN -)
- SJB

PINPOINT TEST H: THE SMART JUNCTION BOX (SJB) DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
H1 CHECK THE SJB FUSE FOR VOLTAGE • Key in OFF position. • **NOTE:** Measurements are taken with the fuses installed. • Measure the voltage between the SJB fuse 5 (10A) and ground.  N0060055 • **Is the voltage greater than 10 volts?**	**Yes** GO to H2 . **No** VERIFY the smart junction box (SJB) fuse 5 (10A) is OK. If OK, GO to H4 .

H2 CHECK THE SJB GROUND CIRCUITS FOR AN OPEN • Key in OFF position. • Disconnect: SJB C2280e. • Measure the resistance between the SJB, harness side and ground as follows: **SJB Connector-Pin** / **Circuit** C2280e-8 / GD133 (BK) C2280e-12 / GD133 (BK) • **Are the resistances less than 5 ohms?**	**Yes** GO to H3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
H3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE SJB FOR AN OPEN • Disconnect: SJB C2280g. • Measure the resistance between the SJB C2280g-37, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0057258 • Measure the resistance between the SJB C2280g-38, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0057259 • **Are the resistances less than 5 ohms?**	**Yes** GO to H4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

H4 CHECK FOR CORRECT SJB OPERATION
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with

	the scan tool.

Pinpoint Test I: The Electronic Manual Temperature Control Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

The electronic manual temperature control module communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the electronic manual temperature control module. The electronic manual temperature control module shares the MS-CAN network with the instrument cluster, the smart junction box (SJB), the audio unit, the THX® amplifier (if equipped), the satellite radio receiver (if equipped), the auxiliary audio module, the digital versatile disc (DVD) player, the driver seat module (DSM) (if equipped), the power running board module, the parking aid module (if equipped), the power liftgate module and the climate controlled seat module (if equipped). Voltage for the electronic manual temperature control module is provided by circuits CBP37 (WH) and SBP15 (WH/RD). Circuit GD133 (BK) provides ground.

Possible Causes

- Fuse
- Circuit CBP37 (WH) open
- Circuit GD133 (BK) open
- Circuit SBP15 (WH/RD) open
- Circuit VDB06 (GY/OG) open (MS-CAN +)
- Circuit VDB07 (VT/OG) open (MS-CAN -)
- Electronic manual temperature control module

PINPOINT TEST I: THE ELECTRONIC MANUAL TEMPERATURE CONTROL MODULE DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
I1 CHECK THE ELECTRONIC MANUAL TEMPERATURE CONTROL MODULE VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Key in OFF position. • Disconnect: Electronic Manual Temperature Control Module C2357a. • Key in ON position. • Measure the voltage between the electronic manual temperature control module C2357a-12, circuit CBP37 (WH), and the electronic manual temperature control module C2357a-13, circuit SBP15 (WH/RD) and ground.	**Yes** GO to I2 . **No** VERIFY smart junction box (SJB) fuse 15 (10A) or 37 (10A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0057260 • **Is the voltage greater than 10 volts?**	
I2 CHECK THE ELECTRONIC MANUAL TEMPERATURE CONTROL MODULE GROUND CIRCUIT GD133 (BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the electronic manual temperature control module C2357a-23, circuit GD133 (BK) and ground.  N0057261 • **Is the resistance less than 5 ohms?**	**Yes** GO to I3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
I3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE ELECTRONIC MANUAL TEMPERATURE CONTROL MODULE FOR AN OPEN	
• Measure the resistance between the electronic manual temperature control module C2357a-25, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0060070 • Measure the resistance between the electronic manual temperature control module C2357a-26, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** GO to I4 . **No** REPAIR the circuit as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0060071 • **Are the resistances less than 5 ohms?**	
I4 CHECK FOR CORRECT ELECTRONIC MANUAL TEMPERATURE CONTROL MODULE OPERATION	

• Disconnect all the electronic manual temperature control module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the electronic manual temperature control module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new electronic manual temperature control module. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test J: The Electronic Automatic Temperature Control (EATC) Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

The EATC module communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the EATC module. The EATC module shares the MS-CAN network with the instrument cluster, the smart junction box (SJB), the audio unit, the THX® amplifier (if equipped), the satellite radio receiver (if equipped), the auxiliary audio module, the digital versatile disc (DVD) player, the driver seat module (DSM) (if equipped), the power running board module, the parking aid module (if equipped), the power liftgate module and the climate controlled seat module (if equipped). Voltage for the EATC module is provided by circuits CBP37 (WH) and SBP15 (WH/RD). Circuit GD133 (BK) provides ground.

DTC U0164 — sets in a module which had attempted to communicate with the EATC module and failed.

Possible Causes

- Fuse
- Circuit CBP37 (WH) open
- Circuit GD133 (BK) open

- Circuit SBP15 (WH/RD) open
- Circuit VDB06 (GY/OG) open (MS-CAN +)
- Circuit VDB07 (VT/OG) open (MS-CAN -)
- EATC module

PINPOINT TEST J: THE ELECTRONIC AUTOMATIC TEMPERATURE CONTROL (EATC) MODULE DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
J1 CHECK THE EATC VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Key in OFF position. • Disconnect: EATC Module C228a. • Key in ON position. • Measure the voltage between the EATC module C228a-13, circuit SBP15 (WH/RD), and between the EATC module C228a-12, circuit CBP37 (WH) and ground.  N0057260 • **Is the voltage greater than 10 volts?**	**Yes** GO to J2 . **No** VERIFY smart junction box (SJB) fuse 15 (10A) or 37 (10A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
J2 CHECK THE EATC GROUND CIRCUIT GD133 (BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the EATC module C228a-23, circuit GD133 (BK) and ground.  N0057261 • **Is the resistance less than 5 ohms?**	**Yes** GO to J3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
J3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE EATC MODULE FOR AN OPEN	
• Measure the resistance between the EATC module C228a-25, circuit VDB06 (GY/OG), harness side and the DLC	**Yes** GO to J4 .

C251-3, circuit VDB06 (GY/OG), harness side.  N0060070 • Measure the resistance between the EATC module C228a-26, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0060071 • **Are the resistances less than 5 ohms?**	**No** REPAIR the circuit as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
J4 CHECK FOR CORRECT EATC MODULE OPERATION	

• Disconnect all the EATC module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the EATC module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new EATC module. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test K: The Audio Unit Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

There are 2 types of audio units used on this vehicle, the base audio unit (Audiophile) and the THX® audio unit (if equipped). Both audio units communicate with the scan tool through the medium speed controller area network (CAN), circuits VDB06 (GY/OG) and VDB07 (VT/OG).

Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection

to the audio unit. The audio unit shares the MS-CAN network with the instrument cluster, the smart junction box (SJB), the electronic manual temperature control module (if equipped), the electronic automatic temperature control (EATC) module (if equipped), the audio unit, the THX® amplifier (if equipped), the satellite radio receiver (if equipped), the auxiliary audio module, the digital versatile disc (DVD) player, the driver seat module (DSM) (if equipped), the power running board module, the parking aid module (if equipped), the power liftgate module and the climate controlled seat module (if equipped). Voltage for the audio unit is provided by circuit SBP39 (WH/RD). Circuit GD114 (BK/BU) provides ground.

Possible Causes

- Fuse
- Circuit GD114 (BK/BU) open
- Circuit SBP39 (WH/RD) open
- Circuit VDB06 (GY/OG) open (MS-CAN +)
- Circuit VDB07 (VT/OG) open (MS-CAN -)
- THX® amplifier

PINPOINT TEST K: THE AUDIO UNIT DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
K1 CHECK THE AUDIO UNIT VOLTAGE SUPPLY CIRCUIT SBP39 (WH/RD) FOR AN OPEN	
• Key in OFF position. • Disconnect: Audio Unit C240a. • Key in ON position. • Measure the voltage between the audio unit C240a-1, circuit SBP39 (WH/RD), harness side and ground.  N0058708 • **Is the voltage greater than 10 volts?**	**Yes** GO to K2 . **No** VERIFY the smart junction box (SJB) fuse 39 (20A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
K2 CHECK THE AUDIO UNIT GROUND CIRCUIT GD114 (BK/BU) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the audio unit C240a-13, circuit GD114 (BK/BU), harness side and ground.	**Yes** GO to K3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

 A0073494 • **Is the resistance less than 5 ohms?**	
K3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE AUDIO UNIT FOR AN OPEN	
• Measure the resistance between the audio unit C240b-15, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0026687 • Measure the resistance between the base audio unit C240b-16, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0026688 • **Are the resistances less than 5 ohms?**	**Yes** GO to K4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
K4 CHECK FOR CORRECT AUDIO UNIT OPERATION	

• Disconnect all the audio unit connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the audio unit connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new audio unit. REFER to Section 415-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test L: The THX® Amplifier Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The THX® amplifier communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the THX® amplifier. The THX® amplifier shares the MS-CAN network with the instrument cluster, the smart junction box (SJB), the electronic manual temperature control module (if equipped), the electronic automatic temperature control (EATC) module (if equipped), the audio unit, the satellite radio receiver (if equipped), the auxiliary audio module, the digital versatile disc (DVD) player, the driver seat module (DSM) (if equipped), the power running board module (if equipped), the parking aid module (if equipped), the power liftgate module (if equipped) and the climate controlled seat module (if equipped). Voltage for the THX® amplifier is provided by circuits SBP38 (BN/RD) and SBP40 (VT/RD). Three circuits GD114 (BK/BU) provide ground.

Possible Causes

- Fuse
- Circuit GD114 (BK/BU) open
- Circuit SBP38 (BN/RD) open
- Circuit SBP40 (VT/RD) open
- Circuit VDB06 (GY/OG) open (MS-CAN +)
- Circuit VDB07 (VT/OG) open (MS-CAN -)
- Audio unit

PINPOINT TEST L: THE THX® AMPLIFIER DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>L1 CHECK THE THX® AMPLIFIER VOLTAGE SUPPLY CIRCUITS FOR AN OPEN</td><td rowspan="2">Yes
GO to L2 .

No
VERIFY the smart junction box (SJB) fuse 38 (20A) or fuse 40 (20A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.</td></tr>
<tr><td>• Key in OFF position.
• Disconnect: THX® Amplifier C2364a.

• Measure the voltage between the THX® amplifier, harness side and ground as follows:

<table><tr><th>Connector-Pin</th><th>Circuit</th></tr><tr><td>C2364a-9</td><td>SBP38 (BN/RD)</td></tr><tr><td>C2364a-10</td><td>SBP38 (BN/RD)</td></tr><tr><td>C2364a-11</td><td>SBP40 (VT/RD)</td></tr><tr><td>C2364a-12</td><td>SBP40 (VT/RD)</td></tr></table>
• Are the voltages greater than 10 volts?</td></tr>
<tr><td>L2 CHECK THE THX® AMPLIFIER GROUND CIRCUITS FOR AN OPEN</td><td></td></tr>
</table>

• Key in OFF position. • Measure the resistance between the THX® amplifier, harness side and ground as follows: **Connector-Pin** / **Circuit** C2364a-22 / GD114 (BK/BU) C2364a-23 / GD114 (BK/BU) C2364a-24 / GD114 (BK/BU) • **Are the resistances less than 5 ohms?**	**Yes** GO to L3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
L3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE THX® AMPLIFIER FOR AN OPEN	
• Disconnect: THX® Amplifier C2364c. • Measure the resistance between the THX® amplifier C2364c-11, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0056290 • Measure the resistance between the THX® amplifier C2364c-12, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0056291 • **Are the resistances less than 5 ohms?**	**Yes** GO to L4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
L4 CHECK FOR CORRECT THX® AMPLIFIER OPERATION	

• Disconnect all the THX® amplifier connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the THX® amplifier connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a THX® amplifier. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs.

	REPEAT the network test with the scan tool.

Pinpoint Test M: The Satellite Radio Receiver Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The satellite radio receiver communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the satellite radio receiver. The satellite radio receiver shares the MS-CAN network with the instrument cluster, the smart junction box (SJB), the electronic manual temperature control module (if equipped), the electronic automatic temperature control (EATC) module (if equipped), the audio unit, the THX® amplifier (if equipped), the auxiliary audio module (if equipped), the digital versatile disc (DVD) player (if equipped), the driver seat module (DSM) (if equipped), the power running board module (if equipped), the parking aid module (if equipped), the power liftgate module (if equipped) and the climate controlled seat module (if equipped). Voltage for the satellite radio receiver is provided by circuit SBP03 (BU/RD). Circuit GD114 (BK/BU) provides ground.

Possible Causes

- Fuse
- Circuit GD114 (BK/BU) open
- Circuit SBP03 (BU/RD) open
- Circuit VDB06 (GY/OG) open (MS-CAN +)
- Circuit VDB07 (VT/OG) open (MS-CAN -)
- Satellite radio receiver

PINPOINT TEST M: THE SATELLITE RADIO RECEIVER DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
M1 CHECK THE SATELLITE RADIO RECEIVER VOLTAGE SUPPLY CIRCUIT SBP03 (BU/RD) FOR AN OPEN	
• Key in OFF position. • Disconnect: Satellite Radio Receiver C3290. • Key in ON position. • Measure the voltage between the satellite radio receiver C3290-9, circuit SBP03 (BU/RD), harness side and ground.	**Yes** GO to M2 . **No** VERIFY the smart junction box (SJB) fuse 3 (15A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0053245 • **Is the voltage greater than 10 volts?**	
M2 CHECK THE SATELLITE RADIO RECEIVER GROUND CIRCUIT GD114 (BK/BU) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the satellite radio receiver C3290-3, circuit GD114 (BK/BU), harness side and ground.  N0053246 • **Is the resistance less than 5 ohms?**	**Yes** GO to M3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
M3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE SATELLITE RADIO RECEIVER FOR AN OPEN	
• Measure the resistance between the satellite radio receiver C3290-1, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0026834 • Measure the resistance between the satellite radio receiver C3290-7, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** GO to M4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0026835 • **Are the resistances less than 5 ohms?**	
M4 CHECK FOR CORRECT SATELLITE RADIO RECEIVER OPERATION	

• Disconnect the satellite radio receiver connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the satellite radio receiver connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new satellite radio receiver. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test N: The Auxiliary Audio Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the auxiliary audio module. The auxiliary audio module shares the MS-CAN network with the instrument cluster, the smart junction box (SJB), the electronic manual temperature control module (if equipped), the electronic automatic temperature control (EATC) module (if equipped), the audio unit, the THX® amplifier (if equipped), the satellite radio receiver (if equipped), the driver seat module (DSM) (if equipped), the power running board module (if equipped), the parking aid module (if equipped), the power liftgate module (if equipped) and the climate controlled seat module (if equipped). Voltage for the auxiliary audio module is provided by circuit SBP03 (BU/RD). Circuit GD114 (BK/BU) provides ground.

Possible Causes

- Fuse
- Circuit GD114 (BK/BU) open
- Circuit SBP03 (BU/RD) open
- Circuit VDB06 (GY/OG) open (MS-CAN +)
- Circuit VDB07 (VT/OG) open (MS-CAN -)
- Auxiliary audio module

PINPOINT TEST N: THE AUXILIARY AUDIO MODULE DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
N1 CHECK THE AUXILIARY AUDIO MODULE VOLTAGE SUPPLY CIRCUIT SBP03 (BU/RD) FOR AN OPEN	
• Key in OFF position. • Disconnect: Auxiliary Audio Module C3077. • Key in ON position. • Measure the voltage between the auxiliary audio unit C3077-16, circuit SBP03 (BU/RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to N2. **No** VERIFY the smart junction box (SJB) fuse 3 (15A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
N2 CHECK THE AUXILIARY AUDIO MODULE GROUND CIRCUIT GD114 (BK/BU) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the auxiliary audio module C3077-1, circuit GD114 (BK/BU), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to N3. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
N3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE AUDIO UNIT FOR AN OPEN	
• Measure the resistance between the auxiliary audio module C3077-8, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.	**Yes** GO to N4. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0057265 • Measure the resistance between the auxiliary audio module C3077-7, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0057266 • **Are the resistances less than 5 ohms?**	
N4 CHECK FOR CORRECT AUXILIARY AUDIO MODULE OPERATION • Disconnect the auxiliary audio module connector. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect the auxiliary audio module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new auxiliary audio module. REFER to Section 415-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test O: The Digital Versatile Disc (DVD) Player Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 132 , Video System for schematic and connector information.

Normal Operation

The DVD player communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the DVD player. The DVD player is only on vehicles equipped with rear seat entertainment. The DVD player shares the MS-CAN network with the instrument cluster, the smart junction box (SJB), the electronic manual temperature control module (if equipped), the electronic automatic temperature control (EATC) module (if equipped), the audio unit, the THX® amplifier (if

equipped), the satellite radio receiver (if equipped), the driver seat module (DSM) (if equipped), the power running board module (if equipped), the parking aid module (if equipped), the power liftgate module (if equipped) and the climate controlled seat module (if equipped). Voltage for the DVD player is provided by circuit SBP03 (BU/RD). Circuit GD114 (BK/BU) provides ground.

Possible Causes

- Fuse
- Circuit GD114 (BK/BU) open
- Circuit SBP03 (BU/RD) open
- Circuit VDB06 (GY/OG) open (MS-CAN +)
- Circuit VDB07 (VT/OG) open (MS-CAN -)
- DVD player

PINPOINT TEST O: THE DIGITAL VERSATILE DISC (DVD) PLAYER DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
O1 CHECK THE DVD PLAYER VOLTAGE SUPPLY CIRCUIT SBP03 (BU/RD) FOR AN OPEN	
• Key in OFF position. • Disconnect: DVD Player C949. • Key in ON position. • Measure the voltage between the DVD player C949-16, circuit SBP03 (BU/RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to O2 . **No** VERIFY the smart junction box (SJB) fuse 3 (15A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
O2 CHECK THE DVD PLAYER GROUND CIRCUIT GD114 (BK/BU) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the DVD player C949-1, circuit GD114 (BK/BU), harness side and ground.	**Yes** GO to O3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0057264 • **Is the resistance less than 5 ohms?**	
O3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE AUDIO UNIT FOR AN OPEN	
• Measure the resistance between the auxiliary audio module C949-8, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0057265 • Measure the resistance between the auxiliary audio module C949-7, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0057266 • **Are the resistances less than 5 ohms?**	**Yes** GO to O4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
O4 CHECK FOR CORRECT DVD PLAYER OPERATION	
• Disconnect the DVD player connector. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect the DVD player connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DVD player. REFER to Section 415-07 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test P: The Driver Seat Module (DSM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 123 , Memory Seats for schematic and connector information.

Normal Operation

The DSM communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the DSM. The DSM shares the MS-CAN network with the instrument cluster, the smart junction box (SJB), the electronic manual temperature control module (if equipped), the electronic automatic temperature control (EATC) module (if equipped), the audio unit, the THX® amplifier (if equipped), the satellite radio receiver (if equipped), the power running board module (if equipped), the parking aid module (if equipped), the power liftgate module (if equipped) and the climate controlled seat module (if equipped). Voltage for the DSM is provided by circuit SBB45 (GY/RD). Circuit GD143 (BK/VT) provides ground.

DTC U0208 — sets in a module which had attempted to communicate with the DSM and failed.

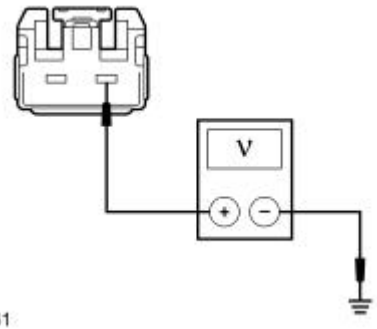
Possible Causes

- Fuse
- Circuit GD143 (BK/VT) open
- Circuit SBB45 (GY/RD) open
- Circuit VDB06 (GY/OG) open (MS-CAN +)
- Circuit VDB07 (VT/OG) open (MS-CAN -)
- DSM

PINPOINT TEST P: THE DRIVER SEAT MODULE (DSM) DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
P1 CHECK THE DSM VOLTAGE SUPPLY CIRCUIT SBB45 (GY/RD) FOR AN OPEN	
• Key in OFF position. • Disconnect: DSM C341a. • Key in ON position. • Measure the voltage between the DSM C341c-1, circuit SBB45 (GY/RD), harness side and ground.	**Yes** GO to P2 . **No** VERIFY the smart junction box (SJB) fuse 2 (15A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.



A0079061

- **Is the voltage greater than 10 volts?**

P2 CHECK THE DSM GROUND CIRCUIT GD143 (BK/VT) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the DSM C341a-2, circuit GD143 (BK/VT), harness side and ground.  A0079062 • **Is the resistance less than 5 ohms?**	**Yes** GO to P3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
P3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE DSM FOR AN OPEN	
• Disconnect: DSM C341e. • Measure the resistance between the DSM C341e-9, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0057267 • Measure the resistance between the DSM C341e-8, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** GO to P4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0057268 • **Are the resistances less than 5 ohms?**	
P4 CHECK FOR CORRECT DSM OPERATION	

• Disconnect all the DSM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the DSM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new DSM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test Q: The Climate Controlled Seat Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

The climate controlled seat module communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the climate controlled seat module. The climate controlled seat module shares the MS-CAN network with the instrument cluster, the smart junction box (SJB), the electronic manual temperature control module (if equipped), the electronic automatic temperature control (EATC) module (if equipped), the audio unit, the THX® amplifier (if equipped), the satellite radio receiver (if equipped), the power running board module (if equipped), the parking aid module (if equipped) and the power liftgate module (if equipped). Voltage for the climate controlled seat module is provided by circuit SBB08 (VT/RD). Circuit GD138 (BK/WH) provides ground.

Possible Causes

- Fuse
- Circuit GD138 (BK/WH) open
- Circuit SBB08 (VT/RD) open
- Circuit VDB06 (GY/OG) open (MS-CAN +)
- Circuit VDB07 (VT/OG) open (MS-CAN -)
- Climate controlled seat module

PINPOINT TEST Q: THE CLIMATE CONTROLLED SEAT MODULE DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>

N0058710 • **Are the resistances less than 5 ohms?**	**Yes** GO to Q6 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q6 CHECK FOR CORRECT CLIMATE CONTROLLED SEAT MODULE OPERATION	

• Disconnect all the climate controlled seat module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the climate controlled seat module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new climate controlled seat module. REFER to Section 501-10 . CLEAR the DTCs. REPEAT the network test with the scan tool.

	No The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test R: The Power Running Board Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Normal Operation

The power running board module communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the power running board module. The power running board module shares the MS-CAN network with the instrument cluster, the smart junction box (SJB), the electronic manual temperature control module (if equipped), the electronic automatic temperature control (EATC) module (if equipped), the audio unit, the THX® amplifier (if equipped), the satellite radio receiver (if equipped), the parking aid module (if equipped), the power liftgate module (if equipped) and the climate controlled seat module (if equipped). Voltage for the power running board module is provided by circuit SBB07 (WH/RD). Circuit GD143 (BK/VT) provides ground.

DTC U0244 — sets in a module which had attempted to communicate with the power running board module and failed.

Possible Causes

- Fuse
- Circuit GD143 (BK/VT) open
- Circuit SBB07 (WH/RD) open
- Circuit VDB06 (GY/OG) open (MS-CAN +)
- Circuit VDB07 (VT/OG) open (MS-CAN -)
- Power running board module

PINPOINT TEST R: THE POWER RUNNING BOARD MODULE DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
R1 CHECK THE POWER RUNNING BOARD MODULE VOLTAGE SUPPLY CIRCUIT SBB07 (WH/RD) FOR AN OPEN	
• Key in OFF position. • Disconnect: Power Running Board Module C3313b. • Key in ON position. • Measure the voltage between the power running board module C3313b-1, circuit SBB07 (WH/RD), harness side	**Yes** GO to R2 . **No** VERIFY the battery junction

and ground.  N0060072 • **Is the voltage greater than 10 volts?**	box (BJB) fuse 7 (40A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
R2 CHECK THE POWER RUNNING BOARD MODULE GROUND CIRCUIT GD143 (BK/VT) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the power running board module C3313b-4, circuit GD143 (BK/VT), harness side and ground.  N0060073 • **Is the resistance less than 5 ohms?**	**Yes** GO to R3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
R3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE POWER RUNNING BOARD MODULE FOR AN OPEN	
• Measure the resistance between the power running board module C3313b-8, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0060074 • Measure the resistance between the power running board module C3313b-7, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** GO to R4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0060134 • **Are the resistances less than 5 ohms?**	
R4 CHECK FOR CORRECT POWER RUNNING BOARD MODULE OPERATION	

• Disconnect all the power running board module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the power running board module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new power running board module. REFER to Section 501-08 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test S: The Parking Aid Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

Normal Operation

The parking aid module communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the parking aid module. The parking aid module shares the MS-CAN network with the instrument cluster, the smart junction box (SJB), the electronic manual temperature control module (if equipped), the electronic automatic temperature control (EATC) module (if equipped), the audio unit, the THX® amplifier (if equipped), the satellite radio receiver (if equipped), the power running board module (if equipped), the power liftgate module (if equipped) and the climate controlled seat module (if equipped). Voltage for the parking aid module is provided by circuit CBP35 (YE/GY). Circuit GD133 (BK) provides ground.

DTC U0159 — sets in a module which had attempted to communicate with the parking aid module and failed.

Possible Causes

- Fuse
- Circuit CBP35 (YE/GY) open
- Circuit GD133 (BK) open

- Circuit VDB06 (GY/OG) open (MS-CAN +)
- Circuit VDB07 (VT/OG) open (MS-CAN -)
- Parking aid module

PINPOINT TEST S: THE PARKING AID MODULE DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
S1 CHECK THE PARKING AID MODULE VOLTAGE SUPPLY CIRCUIT CBP35 (YE/GY) FOR AN OPEN	
• Key in OFF position. • Disconnect: Parking Aid Module C4226. • Key in ON position. • Measure the voltage between the parking aid module C4226-18, circuit CBP35 (YE/GY), harness side and ground.  N0060057 • **Is the voltage greater than 10 volts?**	**Yes** GO to S2. **No** VERIFY the smart junction box (SJB) fuse 35 (10A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
S2 CHECK THE PARKING AID MODULE GROUND CIRCUIT GD143 (BK/VT) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the parking aid module C4226-6, circuit GD133 (BK), harness side and ground.  N0060058 • **Is the resistance less than 5 ohms?**	**Yes** GO to S3. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
S3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE PARKING AID MODULE FOR AN OPEN	
• Measure the resistance between the parking aid module C4226-4, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.	**Yes** GO to S4. **No**

 N0057279 • Measure the resistance between the parking aid module C4226-5, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0057280 • **Are the resistances less than 5 ohms?**	REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
S4 CHECK FOR CORRECT PARKING AID MODULE OPERATION	

• Disconnect the parking aid module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the parking aid module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new parking aid module. REFER to Section 413-13 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test T: The Power Liftgate Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Retractable Running Boards for schematic and connector information.

Normal Operation

The power liftgate module communicates with the scan tool through the medium speed controller area network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the power liftgate module. The power liftgate module shares the MS-CAN network with the instrument cluster, the smart junction box (SJB), the electronic manual temperature control

module (if equipped), the electronic automatic temperature control (EATC) module (if equipped), the audio unit, the THX® amplifier (if equipped), the satellite radio receiver (if equipped), the power running board module (if equipped), the parking aid module (if equipped) and the climate controlled seat module (if equipped). Voltage for the power liftgate module is provided by circuits SBP14 (BN/RD) and SBB27 (BU/RD). Circuit GD149 (BK/GY) provides ground.

DTC U0230 — sets in a module which had attempted to communicate with the power liftgate module and failed.

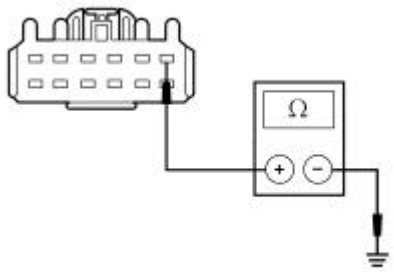
Possible Causes

- Fuse
- Circuit GD149 (BK/GY) open
- Circuit SBP14 (BN/RD) open
- Circuit SBB27 (BU/RD) open
- Circuit VDB06 (GY/OG) open (MS-CAN +)
- Circuit VDB07 (VT/OG) open (MS-CAN -)
- Power liftgate module

PINPOINT TEST T: THE POWER LIFTGATE MODULE DOES NOT RESPOND TO THE SCAN TOOL

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
T1 CHECK THE POWER LIFTGATE MODULE VOLTAGE SUPPLY CIRCUIT SBP14 (BN/RD) FOR AN OPEN	
• Key in OFF position. • Disconnect: Power Liftgate Module C4174a. • Key in ON position. • Measure the voltage between the power liftgate module C4174a-4, circuit SBB27 (BU/RD), harness side and ground and between the power liftgate module C4174a-9, circuit SBP14 (BN/RD), harness side and ground.  N0057281 • **Are the voltages greater than 10 volts?**	**Yes** GO to T2 . **No** VERIFY the smart junction box (SJB) fuse 14 (10A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
T2 CHECK THE POWER LIFTGATE MODULE GROUND CIRCUIT GD149 (BK/GY) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the power liftgate module C4174a-1, circuit GD149 (BK/GY), harness side and ground.	**Yes** GO to T3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.



N0057282

- **Is the resistance less than 5 ohms?**

T3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE POWER LIFTGATE MODULE FOR AN OPEN	
• Disconnect: Power Liftgate Module C4174b. • Measure the resistance between the power liftgate module C4174b-11, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0057283 • Measure the resistance between the power liftgate module C4174b-10, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0057284 • **Are the resistances less than 5 ohms?**	**Yes** GO to T4 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
T4 CHECK FOR CORRECT POWER LIFTGATE MODULE OPERATION	

• Disconnect all the power liftgate module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the power liftgate module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new power liftgate module. REFER to Section 501-03 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been

	caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test U: No Medium Speed Controller Area Network (MS-CAN) Communication, All Modules Are Not Responding

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Normal Operation

The MS-CAN network uses an unshielded twisted pair cable, circuits VDB06 (GY/OG) and VDB07 (VT/OG) provide the network connection to all modules on the network. The smart junction box (SJB), the instrument cluster, the electronic manual temperature control module (if equipped), the electronic automatic temperature control (EATC) module (if equipped), the audio unit, the THX® amplifier (if equipped), the satellite radio receiver (if equipped), the auxiliary audio module (if equipped), the digital versatile disc (DVD) (if equipped), the power running board module (if equipped), the parking aid module (if equipped), the power liftgate module, the driver seat module, and the climate controlled seat module (if equipped) all communicate with the scan tool using the MS-CAN network.

Possible Causes

- Circuit VDB06 (GY/OG) open, short to ground or voltage (MS-CAN +)
- Circuit VDB07 (VT/OG) open, short to ground or voltage (MS-CAN -)
- Circuit VDB06 (GY/OG) (MS-CAN +) and circuit VDB07 (VT/OG) (MS-CAN -) shorted together
- SJB
- Instrument cluster
- Audio unit
- THX® amplifier (if equipped)
- EATC module (if equipped)
- Electronic manual temperature control module (if equipped)
- Auxiliary audio module (if equipped)
- DVD player (if equipped)
- Driver seat module (DSM) (if equipped)
- Climate controlled seat module (if equipped)
- Satellite radio receiver (if equipped)
- Power running board module (if equipped)
- Parking aid module (if equipped)
- Power liftgate module (if equipped)

PINPOINT TEST U: NO MEDIUM SPEED CONTROLLER AREA NETWORK (MS-CAN) COMMUNICATION, ALL MODULES ARE NOT RESPONDING

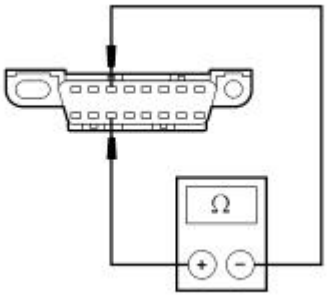
CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
U1 CHECK THE DATA LINK CONNECTOR (DLC) PINS FOR DAMAGE	
NOTE: Most faults are due to connector and/or wiring	**Yes**

concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test. • Key in OFF position. • Disconnect the scan tool cable from the DLC. • Inspect DLC pins 3 and 11 for damage.  N0053178 • **Are DLC pins 3 and 11 OK?**	GO to U2 . **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
U2 CHECK THE MS-CAN TERMINATION RESISTANCE	
• Key in OFF position. • **NOTE:** Failure to disconnect the battery will result in false resistance readings. • Disconnect the battery ground cable. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to U5 . **No** GO to U3 .
U3 CHECK THE MS-CAN TERMINATION RESISTOR	
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to U7 . **No** GO to U4 .
U4 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** GO to U8 .

 N0050701 • **Is the resistance less than 5 ohms?**	**No** GO to U7 .
U5 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to U6 . **No** GO to U33 .
U6 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect the battery ground cable. • Key in ON position. • Measure the voltage between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0050702 • **Is the voltage greater than 6 volts?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** VERIFY all module fuses are OK. If OK, REPEAT the network test with the scan tool.
U7 CHECK THE MS-CAN CIRCUITS BETWEEN THE DLC AND THE SJB FOR AN OPEN	
• Disconnect: SJB C2280h. • Measure the resistance between the SJB C2280h-37, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.	**Yes** VERIFY all module fuses are OK. If OK, CONNECT all modules. CONNECT the battery ground cable. REPEAT the network test with the scan

 N0057258 • Measure the resistance between the SJB C2280h-38, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0057259 • **Are the resistances less than 5 ohms?**	tool. **No** REPAIR the circuit in question. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
U8 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE SJB DISCONNECTED	
• Disconnect: SJB C2280h. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to U9 . **No** GO to U58 .
U9 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE INSTRUMENT CLUSTER DISCONNECTED	
• Disconnect: Instrument Cluster C220. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** GO to U10 . **No** GO to U59 .



N0050701

- **Is the resistance less than 5 ohms?**

U10 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE AUDIO UNIT DISCONNECTED	
• Disconnect: Audio Unit C240b. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to U11 . **No** GO to U60 .
U11 VERIFY VEHICLE EQUIPMENT — THX® AMPLIFIER	
• Inspect the vehicle for THX® amplifier. • **Is the vehicle equipped with THX® amplifier?**	**Yes** GO to U12 . **No** GO to U13 .
U12 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE THX® AMPLIFIER DISCONNECTED	
• Disconnect: THX® Amplifier C2364c. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to U13 . **No** GO to U61 .
U13 VERIFY VEHICLE EQUIPMENT — EATC MODULE	

• Inspect the vehicle for EATC. • **Is the vehicle equipped with EATC?**	**Yes** GO to U14 . **No** GO to U15 .
U14 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE EATC MODULE DISCONNECTED	
• Disconnect: EATC Module C228a. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to U15 . **No** GO to U62 .
U15 VERIFY VEHICLE EQUIPMENT — ELECTRONIC MANUAL TEMPERATURE CONTROL MODULE	
• Inspect the vehicle for an electronic manual temperature control module. • **Is the vehicle equipped with an electronic manual temperature control module?**	**Yes** GO to U16 . **No** GO to U17 .
U16 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE ELECTRONIC MANUAL TEMPERATURE CONTROL MODULE DISCONNECTED	
• Disconnect: Electronic Manual Temperature Control Module C2357a. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to U17 . **No** GO to U63 .
U17 VERIFY VEHICLE EQUIPMENT — AUXILIARY AUDIO MODULE	
• Inspect the vehicle for an auxiliary audio module. • **Is the vehicle equipped with an auxiliary audio module?**	**Yes** GO to U18 . **No**

	GO to U19 .
U18 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE AUXILIARY AUDIO MODULE DISCONNECTED	
• Disconnect: Auxiliary Audio Module C3077. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to U19 . **No** GO to U64 .
U19 VERIFY VEHICLE EQUIPMENT — DVD PLAYER	
• Inspect the vehicle for a DVD player. • **Is the vehicle equipped with a DVD player?**	**Yes** GO to U20 . **No** GO to U21 .
U20 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE DVD PLAYER DISCONNECTED	
• Disconnect: DVD Player C949. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to U21 . **No** GO to U65 .
U21 VERIFY VEHICLE EQUIPMENT — DSM	
• Inspect the vehicle for a DSM. • **Is the vehicle equipped with a DSM?**	**Yes** GO to U22 . **No** GO to U23 .
U22 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE DSM DISCONNECTED	
• Disconnect: Driver Seat Module C341e. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** GO to U23 . **No**

 N0050701 • **Is the resistance less than 5 ohms?**	GO to U66 .
U23 VERIFY VEHICLE EQUIPMENT — CLIMATE CONTROLLED SEAT MODULE • Inspect the vehicle for a climate controlled seat module. • **Is the vehicle equipped with a climate controlled seat module?**	**Yes** GO to U24 . **No** GO to U25 .
U24 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE CLIMATE CONTROLLED SEAT MODULE DISCONNECTED • Disconnect: Climate Controlled Seat Module C3265c. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to U25 . **No** GO to U67 .
U25 VERIFY VEHICLE EQUIPMENT — SATELLITE RADIO RECEIVER • Inspect the vehicle for a satellite radio receiver. • **Is the vehicle equipped with a satellite radio receiver?**	**Yes** GO to U26 . **No** GO to U27 .
U26 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE SATELLITE RADIO RECEIVER DISCONNECTED • Disconnect: Satellite Radio Receiver C3290. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** GO to U27 . **No** GO to U68 .

 N0050701 • **Is the resistance less than 5 ohms?**	
U27 VERIFY VEHICLE EQUIPMENT — POWER RUNNING BOARD MODULE	
• Inspect the vehicle for a power running board module. • **Is the vehicle equipped with a power running board module?**	**Yes** GO to U28 . **No** GO to U29 .
U28 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE POWER RUNNING BOARD MODULE DISCONNECTED	
• Disconnect: Power Running Board Module C3313b. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to U29 . **No** GO to U69 .
U29 VERIFY VEHICLE EQUIPMENT — PARKING AID MODULE	
• Inspect the vehicle for a parking aid module. • **Is the vehicle equipped with a parking aid module?**	**Yes** GO to U30 . **No** GO to U31 .
U30 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE PARKING AID MODULE DISCONNECTED	
• Disconnect: Parking Aid Module C4226. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** REPAIR the circuit. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** GO to U70 .

 N0050701 • **Is the resistance less than 5 ohms?**	
U31 VERIFY VEHICLE EQUIPMENT — POWER LIFTGATE MODULE • Inspect the vehicle for a power liftgate module. • **Is the vehicle equipped with a power liftgate module?**	**Yes** GO to U32 . **No** REPAIR the circuit. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
U32 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE POWER LIFTGATE MODULE DISCONNECTED • Disconnect: Power Liftgate Module C4174b. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** GO to U71 .
U33 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE SJB DISCONNECTED • Disconnect: SJB C2280h. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.	**Yes** GO to U58 . **No** GO to U34 .

 N0008947 • **Are the resistances greater than 5,000 ohms?**	
U34 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE INSTRUMENT CLUSTER DISCONNECTED	
• Disconnect: Instrument Cluster C220. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to U59 . **No** GO to U35 .
U35 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE AUDIO UNIT DISCONNECTED	
• Disconnect: Audio Unit C240b. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to U60 . **No** GO to U36 .
U36 VERIFY VEHICLE EQUIPMENT — THX® AMPLIFIER	
• Inspect the vehicle for a THX® amplifier. • **Is the vehicle equipped with a THX® amplifier?**	**Yes** GO to U37 . **No** GO to U38 .

U37 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE THX® AMPLIFIER DISCONNECTED	
• Disconnect: THX® Amplifier C2364c. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to U61 . **No** GO to U38 .
U38 VERIFY VEHICLE EQUIPMENT — EATC MODULE	
• Inspect the vehicle for an EATC module. • **Is the vehicle equipped with an EATC module?**	**Yes** GO to U39 . **No** GO to U40 .
U39 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE EATC MODULE DISCONNECTED	
• Disconnect: EATC Module C228a. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to U62 . **No** GO to U40 .
U40 VERIFY VEHICLE EQUIPMENT — ELECTRONIC MANUAL TEMPERATURE CONTROL MODULE	
• Inspect the vehicle for an electronic manual temperature control module. • **Is the vehicle equipped with an electronic manual temperature control module?**	**Yes** GO to U41 . **No** GO to U42 .
U41 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE ELECTRONIC MANUAL TEMPERATURE CONTROL MODULE DISCONNECTED	
• Disconnect: Electronic Manual Temperature Control	**Yes**

Module C2357a. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 5,000 ohms?**	GO to U63 . **No** GO to U42 .
U42 VERIFY VEHICLE EQUIPMENT — AUXILIARY AUDIO MODULE	
• Inspect the vehicle for an auxiliary audio module. • **Is the vehicle equipped with an auxiliary audio module?**	**Yes** GO to U43 . **No** GO to U44 .
U43 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE AUXILIARY AUDIO MODULE DISCONNECTED	
• Disconnect: Auxiliary Audio Module C3077. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to U64 . **No** GO to U44 .
U44 VERIFY VEHICLE EQUIPMENT — DVD PLAYER	
• Inspect the vehicle for a DVD player. • **Is the vehicle equipped with a DVD player?**	**Yes** GO to U45 . **No** GO to U46 .
U45 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE DVD PLAYER DISCONNECTED	
• Disconnect: DVD Player C949. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.	**Yes** GO to U65 . **No** GO to U46 .

 N0008947 • **Are the resistances greater than 5,000 ohms?**	
U46 VERIFY VEHICLE EQUIPMENT — DRIVER SEAT MODULE	
• Inspect the vehicle for a driver seat module. • **Is the vehicle equipped with a driver seat module?**	**Yes** GO to U47 . **No** GO to U48 .
U47 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE DRIVER SEAT MODULE DISCONNECTED	
• Disconnect: Driver Seat Module C341e. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to U66 . **No** GO to U48 .
U48 VERIFY VEHICLE EQUIPMENT — CLIMATE CONTROLLED SEAT MODULE	
• Inspect the vehicle for a climate controlled seat module. • **Is the vehicle equipped with a climate controlled seat module?**	**Yes** GO to U49 . **No** GO to U50 .
U49 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE CLIMATE CONTROLLED SEAT MODULE DISCONNECTED	
• Disconnect: Climate Controlled Seat Module C3265c. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.	**Yes** GO to U67 . **No** GO to U50 .

 N0008947 • **Are the resistances greater than 5,000 ohms?**	
U50 VERIFY VEHICLE EQUIPMENT — SATELLITE RADIO RECEIVER	
• Inspect the vehicle for a satellite radio receiver. • **Is the vehicle equipped with a satellite radio receiver?**	**Yes** GO to U51 . **No** GO to U52 .
U51 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE SATELLITE RADIO RECEIVER DISCONNECTED	
• Disconnect: Satellite Radio Receiver C3290. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to U68 . **No** GO to U52 .
U52 VERIFY VEHICLE EQUIPMENT — POWER RUNNING BOARD MODULE	
• Inspect the vehicle for a power running board module. • **Is the vehicle equipped with a power running board module?**	**Yes** GO to U53 . **No** GO to U54 .
U53 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE POWER RUNNING BOARD MODULE DISCONNECTED	
• Disconnect: Power running Board Module C3313b. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.	**Yes** GO to U69 . **No** GO to U54 .

 N0008947 • **Are the resistances greater than 5,000 ohms?**	
U54 VERIFY VEHICLE EQUIPMENT — PARKING AID MODULE	
• Inspect the vehicle for a parking aid module. • **Is the vehicle equipped with a parking aid module?**	**Yes** GO to U55 . **No** GO to U56 .
U55 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE PARKING AID MODULE DISCONNECTED	
• Disconnect: Parking Aid Module C4226. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to U70 . **No** GO to U56 .
U56 VERIFY VEHICLE EQUIPMENT — POWER LIFTGATE MODULE	
• Inspect the vehicle for a power liftgate module. • **Is the vehicle equipped with a power liftgate module?**	**Yes** GO to U57 . **No** REPAIR the circuit. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
U57 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE POWER LIFTGATE MODULE DISCONNECTED	
• Disconnect: Power Liftgate Module C4174b. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.	**Yes** GO to U71 . **No** REPAIR the circuit. CONNECT

 N0008947 • **Are the resistances greater than 5,000 ohms?**	all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

U58 CHECK FOR CORRECT SJB OPERATION
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

U59 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION
• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

U60 CHECK FOR CORRECT AUDIO UNIT OPERATION
• Disconnect all the audio unit connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the audio unit connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new audio unit. REFER to Section 415-01 . CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The

	concern may have been caused by a loose or corroded connector. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

U61 CHECK FOR CORRECT THX® AMPLIFIER OPERATION
• Disconnect all the THX® amplifier connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the THX® amplifier connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a THX® amplifier. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

U62 CHECK FOR CORRECT EATC MODULE OPERATION
• Disconnect all the EATC module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the EATC module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new EATC module. REFER to Section 412-01 . CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

U63 CHECK FOR CORRECT ELECTRONIC MANUAL TEMPERATURE CONTROL MODULE OPERATION
• Disconnect all the electronic manual temperature control module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the electronic manual temperature control module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new electronic manual temperature control module. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

U64 CHECK FOR CORRECT AUXILIARY AUDIO MODULE OPERATION	

• Disconnect the auxiliary audio module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the auxiliary audio module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new auxiliary audio module. REFER to Section 415-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

U65 CHECK FOR CORRECT DVD PLAYER OPERATION	

• Disconnect the DVD player connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the DVD player connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new DVD player. REFER to Section 415-07 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

U66 CHECK FOR CORRECT DSM OPERATION	

• Disconnect all the DSM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the DSM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new DSM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

U67 CHECK FOR CORRECT CLIMATE CONTROLLED SEAT MODULE OPERATION	

• Disconnect all the climate controlled seat module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the climate controlled seat module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new climate controlled seat module. REFER to Section 501-10 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with

	the scan tool.
U68 CHECK FOR CORRECT SATELLITE RADIO RECEIVER OPERATION	

• Disconnect the satellite radio receiver connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the satellite radio receiver connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new satellite radio receiver. REFER to Section 415-00 . CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

U69 CHECK FOR CORRECT POWER RUNNING BOARD MODULE OPERATION	

• Disconnect all the power running board module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the power running board module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new power running board module. REFER to Section 501-08 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

U70 CHECK FOR CORRECT PARKING AID MODULE OPERATION	

• Disconnect all the parking aid module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the parking aid module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new parking aid module. REFER to Section 413-13 . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

U71 CHECK FOR CORRECT POWER LIFTGATE MODULE OPERATION	
• Disconnect all the power liftgate module connectors. • Check for: ▪ corrosion	**Yes** INSTALL a new power liftgate module. REFER to Section

■ damaged pins ■ pushed-out pins • Connect all the power liftgate module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	501-03 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test V: No High Speed Controller Area Network (HS-CAN) Communication, All Modules Are Not Responding

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Normal Operation

The HS-CAN uses an unshielded twisted pair cable, circuits VDB04 (WH/BU) and VDB05 (WH). The powertrain control module (PCM), the transmission control module (TCM), the anti-lock brake system (ABS) module, the restraints control module (RCM), the four wheel drive (4WD) control module (if equipped), the air suspension module (if equipped) and the instrument cluster all communicate with the scan tool using the HS-CAN.

Possible Causes

- Circuit VDB04 (WH/BU) open, short to ground or voltage (HS-CAN +)
- Circuit VDB05 (WH) open, short to ground or voltage (HS-CAN -)
- Circuit VDB04 (WH/BU) (HS-CAN +) and circuit VDB05 (WH) (HS-CAN -) shorted together
- PCM
- RCM
- TCM
- ABS module
- Instrument cluster
- 4WD control module (if equipped)
- Air suspension module (if equipped)

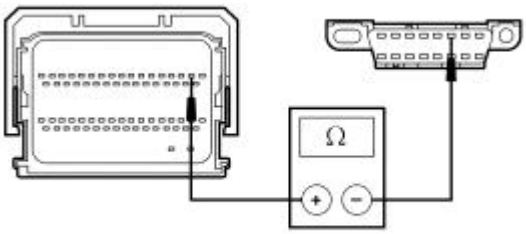
PINPOINT TEST V: NO HIGH SPEED CONTROLLER AREA NETWORK (HS-CAN) COMMUNICATION, ALL MODULES ARE NOT RESPONDING

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
V1 CHECK THE DATA LINK CONNECTOR (DLC) PINS FOR DAMAGE	
NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test. • Key in OFF position. • Disconnect the scan tool cable from the DLC.	**Yes** GO to V2 . **No** REPAIR the DLC as necessary.

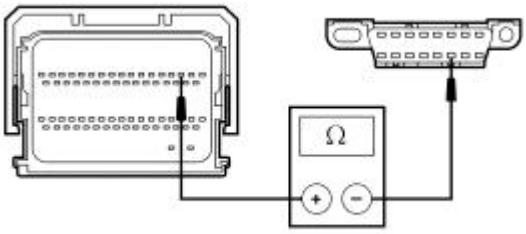
• Inspect DLC pins 6 and 14 for damage.  A0093867 • **Are DLC pins 6 and 14 OK?**	CLEAR the DTCs. REPEAT the network test with the scan tool.
V2 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Key in OFF position. • **NOTE:** Failure to disconnect the battery will result in false resistance readings. • Disconnect the battery ground cable. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to V3 . **No** GO to V5 .
V3 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to V4 . **No** GO to V20 .
V4 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect the battery ground cable. • Key in ON position. • Measure the voltage between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.

side and ground.  N0002964 • **Is the voltage greater than 6 volts?**	**No** The CAN network has tested within specifications. VERIFY the scan tool operation on a substitute vehicle and REPEAT the network test on the suspect vehicle.
V5 CHECK THE HS-CAN TERMINATION RESISTOR	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to V6 . **No** GO to V9 .
V6 CHECK THE HS-CAN TERMINATION RESISTOR WITH THE PCM DISCONNECTED	
• Disconnect: PCM C175b. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to V7 . **No** GO to V8 .
V7 CHECK THE HS-CAN CIRCUITS BETWEEN THE DLC AND THE PCM FOR AN OPEN	
• Measure the resistance between the PCM C175b-2, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.	**Yes** GO to V29 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.



N0026577

- Measure the resistance between the PCM C175b-3, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.

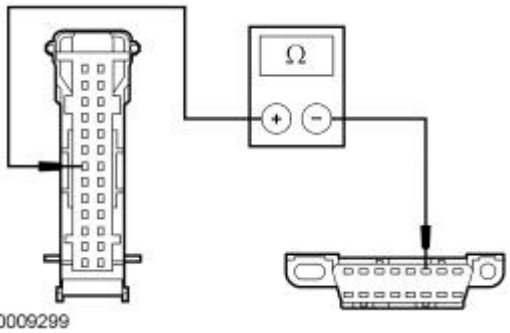


N0026578

- **Are the resistances less than 5 ohms?**

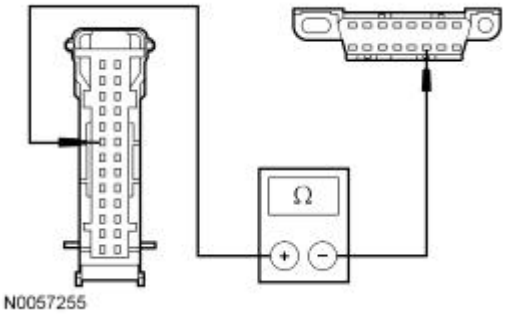
V8 CHECK THE HS-CAN CIRCUITS BETWEEN THE DLC AND THE INSTRUMENT CLUSTER FOR AN OPEN

- Measure the resistance between the instrument cluster C220-7, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.



N0009299

- Measure the resistance between the instrument cluster C220-8, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.



N0057255

- **Are the resistances less than 5 ohms?**

Yes
GO to V34 .

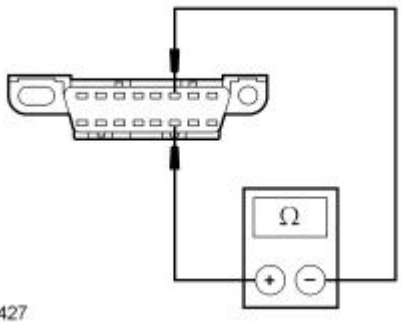
No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.

V9 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER

• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to V11 . **No** GO to V10 .
V10 CHECK THE HS-CAN CIRCUITS BETWEEN THE DLC AND THE PCM FOR AN OPEN	
• Measure the resistance between the PCM C175b-2, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0026577 • Measure the resistance between the PCM C175b-3, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026578 • **Are the resistances less than 5 ohms?**	**Yes** The CAN network has tested within specifications. Verify the scan tool operation on a substitute vehicle, and REPEAT the network test on the suspect vehicle. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
V11 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE PCM DISCONNECTED	
• Disconnect: PCM C175b. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** GO to V12 . **No** GO to V29 .

 N0026427 • **Is the resistance less than 5 ohms?**	
V12 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE ABS MODULE DISCONNECTED	
• Disconnect: ABS Module C135. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to V13 . **No** GO to V30 .
V13 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE TCM DISCONNECTED	
• Disconnect: TCM C1548 (Expedition) or C1473 (Navigator). • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to V14 . **No** GO to V31 .
V14 VERIFY VEHICLE EQUIPMENT — 4WD CONTROL MODULE	
• Inspect the vehicle for 4WD. • **Is the vehicle equipped with 4WD?**	**Yes** GO to V15 . **No** GO to V16 .

V15 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE 4WD CONTROL MODULE DISCONNECTED	
• Disconnect: 4WD Control Module C281a. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to V16 . **No** GO to V32 .
V16 VERIFY VEHICLE EQUIPMENT — AIR SUSPENSION MODULE	
• Inspect the vehicle for air suspension. • **Is the vehicle equipped with air suspension?**	**Yes** GO to V17 . **No** GO to V18 .
V17 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE AIR SUSPENSION MODULE DISCONNECTED	
• Disconnect: Air Suspension Module C2324b (Expedition) or C2131b (Navigator). • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to V18 . **No** GO to V33 .
V18 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE INSTRUMENT CLUSTER DISCONNECTED	
• Disconnect: Instrument Cluster C220. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** GO to V19 . **No** GO to V34 .



N0026427

- **Is the resistance less than 5 ohms?**

V19 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE RCM DISCONNECTED	
• Depower the supplemental restraint system (SRS). Refer to Section 501-20B . • Disconnect: RCM C310b. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuits. CONNECT all modules. REPOWER the SRS. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** GO to V35 .
V20 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE PCM DISCONNECTED	
• Disconnect: PCM C175b. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to V29 . **No** GO to V21 .
V21 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE ABS MODULE DISCONNECTED	
• Disconnect: ABS Module C135. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and	**Yes** GO to V30 .

between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 5,000 ohms?**	**No** GO to V22 .
V22 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE TCM DISCONNECTED	
• Disconnect: TCM C1548 (Expedition) or C1473 (Navigator). • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to V31 . **No** GO to V23 .
V23 VERIFY VEHICLE EQUIPMENT — 4WD CONTROL MODULE	
• Inspect the vehicle for 4WD. • **Is the vehicle equipped with 4WD?**	**Yes** GO to V24 . **No** GO to V25 .
V24 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE 4WD CONTROL MODULE DISCONNECTED	
• Disconnect: 4WD Control Module C281a. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.	**Yes** GO to V32 . **No** GO to V25 .

 N0002963 • **Are the resistances greater than 5,000 ohms?**	
V25 VERIFY VEHICLE EQUIPMENT — AIR SUSPENSION	
• Inspect the vehicle for air suspension. • **Is the vehicle equipped with air suspension?**	**Yes** GO to V26 . **No** GO to V27 .
V26 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE AIR SUSPENSION MODULE DISCONNECTED	
• Disconnect: Air Suspension Module C2324b (Expedition) or C2131b (Navigator). • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to V33 . **No** GO to V27 .
V27 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE INSTRUMENT CLUSTER DISCONNECTED	
• Disconnect: Instrument Cluster C220. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to V34 . **No** GO to V28 .

V28 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE RCM DISCONNECTED	
• Depower the SRS. Refer to Section 501-20B . • Disconnect: RCM C310b. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 5,000 ohms?**	**Yes** GO to V35 . **No** REPAIR the circuit. CONNECT all modules. REPOWER the SRS. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
V29 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

V30 CHECK FOR CORRECT ABS MODULE OPERATION	

• Disconnect the ABS module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the ABS module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Section 206-09 . CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

V31 CHECK FOR CORRECT TCM OPERATION	
• Disconnect the TCM connector. • Check for:	**Yes** INSTALL a new TCM. REFER to

■ corrosion ■ damaged pins ■ pushed-out pins • Connect the TCM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	Section 307-01A for the 6HP26 transmission or Section 307-01B for the 6R75. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
V32 CHECK FOR CORRECT 4WD CONTROL MODULE OPERATION	
• Disconnect the 4WD control module connector. • Check for: ■ corrosion ■ damaged pins ■ pushed-out pins • Connect the 4WD control module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4WD control module. REFER to Section 308-07A . CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
V33 CHECK FOR CORRECT AIR SUSPENSION MODULE OPERATION	
• Disconnect all the air suspension module connectors. • Check for: ■ corrosion ■ damaged pins ■ pushed-out pins • Connect all the air suspension module connectors and make sure they seat correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new air suspension module. REFER to Section 204-05 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
V34 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect the instrument cluster connector. • Check for: ■ corrosion ■ damaged pins ■ pushed-out pins • Connect the instrument cluster connector and make sure it seats correctly.	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . CONNECT all modules. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with

• Operate the system and verify the concern is still present. • **Is the concern still present?**	the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT the battery ground cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
V35 CHECK FOR CORRECT RCM OPERATION	

• Disconnect all the RCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the RCM connectors and make sure they seat correctly.
• Verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RCM. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. REPOWER the SRS. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test W: No Power To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Normal Operation

The scan tool is connected to the data link connector (DLC) to communicate with the high speed controller area network (HS-CAN) and the medium speed controller area network (MS-CAN) communications network. Voltage for the scan tool is provided by circuit SBP20 (GN/RD). Ground is provided by circuits GD113 (BK/YE) and GD138 (BK/WH).

Possible Causes

- Fuse
- Circuit SBP20 (GN/RD) open
- Circuit GD113 (BK/YE) open
- Circuit GD138 (BK/WH) open
- Scan tool

PINPOINT TEST W: NO POWER TO THE SCAN TOOL

Test Step	Result / Action to Take
W1 CHECK THE DLC PINS FOR DAMAGE	
NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test. • Disconnect the scan tool cable from the DLC. • Inspect DLC pins 4, 5 and 16 for damage.	**Yes** GO to W2 . **No** REPAIR the DLC as

 N0050767 • **Are DLC pins 4, 5 and 16 OK?**	necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
W2 CHECK THE DLC VOLTAGE SUPPLY CIRCUIT SBP20 (GN/RD) FOR AN OPEN	
• Measure the voltage between the DLC C251-16, circuit SBP20 (GN/RD), harness side and ground.  A0057467 • **Is the voltage greater than 10 volts?**	**Yes** GO to W3 . **No** VERIFY the smart junction box (SJB) fuse 20 (15A) is OK. If OK, REPAIR the circuit. REPEAT the network test with the scan tool.
W3 CHECK THE DLC GROUND CIRCUITS FOR AN OPEN	
• Measure the resistance between the DLC C251-4, circuit GD138 (BK/WH), harness side and ground; and between the DLC C251-5, circuit GD113 (BK/YE), harness side and ground.  A0060571 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the scan tool. REPEAT the network test with the scan tool. **No** REPAIR the circuit in question. REPEAT the network test with the scan tool.

Module Configuration

Printable View (103 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Configurable modules accommodate a variety of vehicle options, eliminating the need for many unique modules for one vehicle line. These modules must be configured when replaced as part of a repair procedure.

Configurable modules should not be exchanged between vehicles since the settings are unique to each vehicle. Failure to configure a new module may result in improper operation and/or any of the following DTCs setting:

- B2477 and/or B2141 — sets when a body/chassis module is not configured.
- B2900 — sets when there is a VIN mismatch between the module with the B2900 and the PCM. Either the PCM or the body module stored VIN may be incorrect.
- P0602, P0605 and/or P1639 — sets when the powertrain control module (PCM) vehicle identification (VID) block is not configured or is configured incorrectly.
- U0300 and/or U0301 — sets when the configuration between 2 or more modules do not match.
- U2050 and/or U2051 — sets when a valid strategy/calibration is not present.

The following are the 3 different methods of configuration:

- Programmable module installation (PMI)
- Module reprogramming ("flashing")
- Programmable parameters

Some modules do not support all 3 methods.

Definition of Terms

The following are definitions of configuration terms:

Programmable Module Installation (PMI)

PMI is a scan tool process which configures settings in a new module. Data used for the PMI process is automatically downloaded from the original module and stored when a scan tool session is started. If this data cannot be retrieved from the module being replaced, the scan tool may prompt for As-Built data entry or display a list of parameter values that need to be manually selected. Some modules are reprogrammed during PMI when a strategy/calibration update is available.

NOTE: A module must be able to communicate with the scan tool in order to carry out PMI. It is

important that the scan tool identifies the vehicle and obtains configuration data prior to removing any modules.

To carry out PMI, refer to Programmable Module Installation in this section.

Module Reprogramming

Module reprogramming (also referred to as "flashing") is a scan tool process which updates the strategy/calibration in a module. Module reprogramming is automatically carried out during PMI when a later strategy/calibration is available. Reprogramming a module with the same level of software will not improve module operation or repair a hardware failure.

NOTE: Module reprogramming should be limited to circumstances where a published Technical Service Bulletin (TSB) procedure recommends doing so.

NOTE: A module cannot communicate with other modules on the communication network while being reprogrammed. Clear any network communication DTCs which may have been set in other modules during reprogramming.

Programmable Parameters

Programmable parameters are customer preference items that may be modified by the dealer via scan tool or in some cases modified by the customer following a procedure listed in the vehicle Owner's Literature. While many configuration options may exist for a module, only a few of these options are programmable parameters.

Adaptive Learning and Calibration

Some modules require a separate learning procedure be carried out if replaced as part of a repair procedure. For adaptive learning and calibration instructions, refer to the specific module removal and installation procedures.

Vehicle Identification (VID) Block

Some PCMs contain a memory area called a vehicle identification (VID) block. The PCM VID block commonly stores powertrain configuration items such as VIN, tire size, axle ratio, and whether or not the vehicle is equipped with speed control.

As-Built Data

As-Built data is a VIN specific module configuration record. During vehicle build, the configuration from all modules is downloaded and stored in the As-Built database. As Built data will not reflect customer preference items that have been changed from the default state. These items will need to be changed using programmable parameters after the module is configured.

NOTE: It is not necessary to obtain As-Built data unless directed to do so by the scan tool. This data may be accessed from the technician service publication website.

The following chart lists body/chassis module As-Built data addresses:

Body/Chassis Module Addresses for As-Built Entry

Module Name	Module Address
Anti-lock brake system (ABS) module	760
Audio unit	727
Auxiliary audio module	774

Climate controlled seat module (CCSM)	776
Digital versatile disc (DVD) player	771
Driver seat module (DSM)	744
Instrument cluster	720
Parking aid module	736
Restraints control module (RCM)	737
Satellite radio receiver	782
Smart junction box (SJB)	726
THX® amplifier	783

The following chart describes specific module programming information:

Module Configuration and Parameter Index

Module Name	Reprogram/ Flash Capable	Requires PMI	Requires Adaptive Learning	Requires Calibration	Available Programmable Parameters
Air suspension module	No	No	No	No	• None
Anti-lock brake system (ABS) module	No	Yes	No	Yes (with stability assist)	• Tire size
Audio unit	Yes	Yes	No	No	• Analog clock enable/disable
Auxiliary audio module	Yes	Yes	No	No	• SDARS enable/disable
Climate controlled seat module (CCSM)	Yes	Yes	No	No	• None
Driver seat module (DSM)	Yes	Yes	No	No	• Easy entry/exit

Transmission control module (TCM)	Yes	No	Yes	No	• None
THX® amplifier	Yes	Yes	No	No	• None

Inspection and Verification

This section provides step-by-step module configuration procedures. Carry out the programmable module installation (PMI) procedure in this section when another workshop manual section directs to carry out configuration or when DTCs from the below list are present:

Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B2477	Module Configuration Failure	• Anti-lock brake system (ABS) module • Audio unit • Auxiliary audio module • Climate controlled seat module (CCSM) • Driver seat module (DSM) • DVD player • Instrument cluster • Parking aid module • Smart junction box (SJB) • Satellite radio receiver	CARRY OUT PMI. REFER to Programmable Module Installation in this section.

		• THX®amplifier	
B2477	Module Configuration Failure	• Air suspension module	INSTALL a new air suspension module. REFER to Section 204-05 .
B2900	VIN mismatch	• ABS module • RCM	CARRY OUT PMI. REFER to Programmable Module Installation in this section.
P0602	Powertrain Control Module Programming Error	• Powertrain control module (PCM)	CARRY OUT PMI. REFER to Programmable Module Installation in this section.
P0605	Internal Control Module Read Only Memory (ROM) Error	• PCM	CARRY OUT PMI. REFER to Programmable Module Installation in this section.
P0605	Internal Control Module Read Only Memory (ROM) Error	• Transmission control module (TCM)	INSTALL a new TCM. REFER to Section 307-01A or Section 307-01B .
P1639	Vehicle ID Block Corrupted, Not Programmed	• PCM	CARRY OUT PMI. REFER to Programmable Module Installation in this section.
U0300	Internal Control Module Software Incompatibility	• PCM • RCM	CARRY OUT PMI. REFER to Programmable Module Installation in this section.
U2050	No Application Present	• ABS module • Audio unit • Auxiliary audio module • CCSM • DSM • DVD player • Instrument cluster • Parking aid module • PCM • RCM • SJB • Satellite radio receiver • THX® amplifier • TCM	CARRY OUT PMI. REFER to Programmable Module Installation in this section.
U2050	No Application Present	• Air suspension module	INSTALL a new air suspension module. REFER to Section 204-05 .
U2050	No Application Present	• Electronic automatic temperature control (EATC) module	INSTALL a new EATC module. REFER to Section 412-01 .
U2050	No Application Present	• Power liftgate module	INSTALL a new power liftgate module. REFER to Section 501-03 .
U2050	No Application Present	• Power running board module	INSTALL a new power running board module. REFER to Section 501-08 .
U2050	No Application Present	• Four wheel drive (4WD) control module	INSTALL a new 4WD control module. REFER to Section 308-07A .
U2051	One or More Calibration Files Missing / Corrupt	• Audio unit • Instrument cluster • PCM • RCM • THX® amplifier	CARRY OUT PMI. REFER to Programmable Module Installation in this section.

		• Parking aid module	
U2051	One or More Calibration Files Missing / Corrupt	• Power liftgate module	INSTALL a new power liftgate module. REFER to Section 501-03 .

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is Available

NOTE: Following module installation, some modules require a separate learning procedure be carried out. For adaptive learning and calibration instructions, refer to the specific module removal and installation procedures.

1. Connect the IDS and identify the vehicle as normal.
2. From the Toolbox icon, select Module Programming and press the check mark.
3. Select Programmable Module Installation.
4. Select the module that is being replaced.
5. Follow the on-screen instructions, turn the ignition key to the OFF position, and press the check mark.
6. Install the new module and press the check mark.
7. Follow the on-screen instructions, turn the ignition key to the ON position, and press the check mark.
8. The IDS downloads the data into the new module and displays Module Configuration Complete.
9. Test module for correct operation.

Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is NOT Available

NOTE: Following module installation, some modules require a separate learning procedure be carried out. For adaptive learning and calibration instructions, refer to the specific module removal and installation procedures.

1. Install the new module.
2. Connect the IDS and identify the vehicle as normal.

3. From the Toolbox icon, select Module Programming and press the check mark.
4. Select Programmable Module Installation.
5. Select the module that was replaced.
6. Follow the on-screen instructions, turn the ignition key to the OFF position, and press the check mark.
7. Follow the on-screen instructions, turn the ignition key to the ON position, and press the check mark.
8. If the data is not available, the IDS displays a screen stating to contact the As-Built Data Center. Retrieve the data from the technician service publication website at this time and press the check mark.
9. Enter the module data and press the check mark.
10. The IDS downloads the data into the new module and displays Module Configuration Complete.
11. Test module for correct operation.

Anti-Theft

Printable View (82 KB)

NOTE: If the instrument cluster or the PCM (or both) is installed, the parameters MUST be re-set in both modules or the vehicle will experience a passive anti-theft system (PATS) no-start. For additional information, refer to Passive Anti-Theft System (PATS) Parameter Reset in this section.

PATS consists of the following components:

- Anti-theft indicator (located in the instrument cluster)
- Encoded (the key contains a transponder) ignition key
- PATS transceiver
- Instrument cluster

PATS uses radio frequency identification technology to deter a drive-away theft. Passive means that it does not require any activity by the user.

The vehicle is equipped with 2 PATS keys. A maximum of 8 PATS keys can be programmed to start the vehicle. If additional PATS keys are desired, refer to Spare Key Programming — Unlimited Key Mode in this section.

PATS Function

The PATS function is controlled by the instrument cluster. The PATS uses the instrument cluster to carry out all of the PATS functions such as receiving the identification code from the PATS key, issuing a signal to the powertrain control module (PCM) to control the starter and fuel injectors enable, and initiates the key interrogation sequence when the ignition key is turned to the ON or START position. Because of the interaction between the instrument cluster and the PCM, there are parameters that must be set if the instrument cluster or the PCM (or both) are replaced. For additional information, refer to Passive Anti-Theft System (PATS) Parameter Reset in this section. If the instrument cluster must be replaced for any reason (PATS concerns or driveability concerns), the PATS keys also must be programmed into the new instrument cluster. For additional information, refer to Key Programming Using Diagnostic Equipment in this section. All elements of PATS must be functional before the vehicle will start. If any of the components are not working correctly, the vehicle will not start.

PATS is active only for a few seconds when the vehicle is starting. It is not a PATS concern if the vehicle stalls after it has been running for a minimum of 3 seconds. PATS will not disable a running vehicle.

PATS is not compatible with aftermarket remote start systems, which allow the vehicle to be started from the exterior of the vehicle. These systems may reduce the security of the vehicle, and also may be the cause of no-start concerns. Remote start systems must be removed from the vehicle before any PATS-related no-start concerns are investigated.

Unlimited Key Mode

PATS contains a feature called unlimited key mode. This feature allows a customer to program more than 8 vehicle keys, if requested. Each vehicle in unlimited key mode is set up with a special unlimited transponder security key code. This allows all the customer vehicles to share the same mechanically cut keys. For an individual customer, any randomly selected security key is acceptable. For additional information, refer to Spare Key Programming — Unlimited Key Mode in this section.

Anti-Theft

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST1137-A	73III Automotive Meter 105-R0057
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

Anti-Theft Indicator

NOTE: Replacement of the passive anti-theft system (PATS) transceiver does not require the PATS keys to be programmed into the instrument cluster again.

NOTE: Make sure any aftermarket remote start systems have been removed from the vehicle before any PATS-related no-start concerns are investigated.

NOTE: A minimum of 2 PATS keys must be programmed into the instrument cluster before the vehicle will start.

NOTE: If the instrument cluster or the powertrain control module (PCM) is being replaced (or both), the parameters must be re-set in both modules or the vehicle will experience a PATS no-start. For additional information, refer to Passive Anti-Theft System (PATS) Parameter Reset in this section.

PATS uses a visual anti-theft indicator located in the instrument cluster. The indicator proves out for 3 seconds when the ignition key is in the ON or START position under normal operation. If there is a PATS concern, this indicator either flashes rapidly or glows steadily when the ignition key is turned to the ON or START position. PATS also flashes the anti-theft indicator every 2 seconds when the ignition key is in the OFF position to act as a visual theft deterrent. Refer to Section 413-01 for additional information on the PATS indicator.

Encoded PATS Keys

PATS uses a special ignition key that is larger than a conventional ignition key because it contains a

permanently installed electronic device called a transponder. Each transponder contains a unique encrypted identification code which is one of a very large number of combinations. The addition of this transponder to the key makes it an "encoded" key. The PATS key does not require batteries and should last the lifetime of the vehicle. Each PATS key must be programmed into the instrument cluster before it can be used to start the vehicle. Up to 8 PATS keys can be programmed into the instrument cluster. If additional PATS keys are desired, a standard PATS key can be used. There are special diagnostic procedures described in this section that must be carried out if a new PATS key is necessary. Refer to Key Programming Using Diagnostic Equipment in this section.

PATS Transceiver

The PATS transceiver is located under the steering column shroud and communicates with the encoded ignition key. During each vehicle start sequence, the PATS transceiver reads the encoded ignition key identification code and sends data to the instrument cluster. The instrument cluster validates the code, and if it is the correct code, will send a message to the powertrain control module (PCM) to ground the starter relay solenoid coil and to also allow the fuel injectors to operate. Refer to Passive Anti-Theft System (PATS) Transceiver in this section.

PATS Operation

The PATS function is controlled by the instrument cluster. When the PATS key is turned to the ON or START position, the instrument cluster initiates the key interrogation sequence by sending a voltage signal to the PATS transceiver. The transceiver then uses its antenna to bounce a signal off the transponder in the PATS key. This process "reads" the PATS key identification code and sends the key identification code back to the instrument cluster, which interprets it and determines if it matches one of the stored key codes. If it does match one of the stored key codes, the instrument cluster will send a message to the PCM to ground the starter relay solenoid coil and to also allow the fuel injectors to operate. If it does not match one of the stored key codes, or it is only a partial key read or no key read, the instrument cluster will send a message to the PCM to not ground the starter relay solenoid coil and not allow fuel injector operation. The anti-theft indicator in the instrument cluster will flash (or may glow steadily) and the instrument cluster will store one or more diagnostic trouble codes (DTCs). All elements of PATS must be functional before the vehicle will start. If any of the components are not working correctly, the vehicle will not start. If the instrument cluster must be replaced for any reason (PATS concerns or driveability concerns), the PATS keys must also be programmed into the new instrument cluster. Refer to Key Programming Using Diagnostic Equipment in this section.

PATS Parameter Identification (PIDs)

Monitoring the PATS PIDs can be very useful in determining which diagnostic steps to follow. Viewing the MASTERKEY (master key) PID (with both keys) will determine if the key is a programmed key and will also prove out the transceiver, circuitry and the instrument cluster. A master key is any key that is programmed into the instrument cluster.

Viewing the MIN_KEY (minimum number of keys) PID (this PID does not change) determines the minimum number of keys that must be programmed into the instrument cluster. There must be at least 2 keys programmed into the instrument cluster in this type of PATS before the vehicle will start.

Viewing the N_KEYCODE (number of keys programmed) PID will determine if the minimum number of keys have been programmed into the instrument cluster. If the N_KEYCODE PID reads 0 or 1, additional key(s) will need to be programmed into the instrument cluster in order to meet the minimum of 2 keys. If the N_KEYCODE PID reads 0 or 1, and the MASTERKEY PID reads NOTPREST, that particular key must be programmed into the instrument cluster. If the N_KEYCODE PID reads 1, and the MASTERKEY PID reads PRESNT, that particular key is already programmed into the instrument cluster.

If the instrument cluster was replaced, the parameters in the instrument cluster, then the parameters in the PCM will need to be reset. When the parameters in the instrument cluster are reset, that clears (erases) the PCM ID from the instrument cluster. A keep-alive memory (KAM) reset of the PCM (also termed a PCM parameter reset) will send a PCM ID to the instrument cluster that is necessary for the system to operate. Make sure to make 3-5 attempts to start the vehicle for 3-5 seconds each before attempting more procedures. The extra key cycles are necessary for the PCM ID to be sent (by the PCM) and then stored by the instrument cluster. If only a PCM parameter reset occurs, the instrument cluster may encounter 2 PCM IDs (the original one and the new one) and may cause a PATS-related

no-start. If a PCM parameter reset occurs first, then the instrument cluster parameter reset occurs, there will be no PCM ID stored in the instrument cluster, and a PATS-related no-start may occur. Carry out the instrument cluster parameter reset first, then the PCM parameter reset next. If the SERV_MOD reads STORED, the instrument cluster has a PCM ID stored. If it reads NOTSTRD, a KAM reset of the PCM may resolve this issue. If the PATSENABL reads NO, and the N_KEYCODE reads 2 or more and the MASTERKEY reads PRESNT, the instrument cluster, then the PCM will need to have their parameters reset.

If the PATSENABL reads NO, and the N_KEYCODE reads 1 and the MASTERKEY reads PRESNT, or if the N_KEYCODE reads 0 and the MASTERKEY reads NOTPRESNT, a minimum of 2 keys will need to be programmed into the instrument cluster. Refer to Key Programming Using Diagnostic Equipment in this section.

If the MASTERKEY continues to read NOTPRESNT after programming, this may indicate a defective key. The SPAREKEY (spare key) PID is defaulted to ENABLE. With the SPAREKEY PID displaying ENABLE, the instrument cluster will accept more than 2 keys (up to a maximum of 8) being programmed into the instrument cluster. Refer to Key Programming Using Two Programmed Keys in this section. It can be toggled to DISABL if the customer does not want any more than 2 keys programmed into the instrument cluster. Refer to Key Programming Switch State Control in this section. This switch state control does not affect the Key Programming Using Diagnostic Equipment procedure.

In summary for the PATS PIDs and their correct state in order for the vehicle to start:

- N_KEYCODE must read 2 or more
- MASTERKEY must read PRESNT
- SERV_MOD must read STORED
- PATSENABL must read YES

Unlimited Key Mode

PATS contains a feature called unlimited key mode and uses the PID UNL_KEY. This feature allows a customer to program more than 8 keys to their vehicle if they request it. Each vehicle in unlimited key mode is set up with a special unlimited transponder security key code. This allows all the customer vehicles to share the same keys, but no other keys from outside can be used to operate the vehicles. For an individual customer, any randomly selected security key is acceptable. Refer to Spare Key Programming — Unlimited Key Mode in this section.

PATS disables the vehicle from starting if there is:

- a damaged PATS key.
- a non-programmed PATS key.
- a non-PATS key (key has no electronics).
- damaged wiring.
- a damaged transceiver.
- a damaged instrument cluster.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Large metallic objects, a second passive anti-theft system (PATS) key on the same key ring as the PATS key, or electronic devices on the key ring that can be used to purchase gasoline or similar items • Ignition lock cylinder • PATS key • Use of a non-PATS key or incorrect PATS key • More than one PATS key on key ring • Remote start system installed	• Smart junction box (SJB) fuse(s): ▪ 26 (10A) ▪ 29 (5A) ▪ 36 (5A) • Circuitry • PATS transceiver • Ignition switch • Instrument cluster

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test:
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the instrument cluster.

9. If the DTCs retrieved are related to the concern, go to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Instrument Cluster Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1213	Anti-Theft Number of Programmed Keys is Below Minimum	If DTCs B1600, B1601, B1602, B1681 or B2103 are present, they must be addressed first. If DTC B1213 is the only DTC present, PROGRAM additional keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
B1342	ECU is Faulted	CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new instrument cluster.

		REFER to Section 413-01 . CYCLE the ignition. REPEAT the self-test.
B1600	PATS Ignition Key Transponder Signal is Not Received	No PATS key has been read by the instrument cluster. Go To Pinpoint Test B .
B1601	PATS Received Incorrect Key-Code From Ignition Key Transponder	There is an unprogrammed PATS key. Go To Pinpoint Test C .
B1602	PATS Received Invalid Format of Key-Code From Ignition Key Transponder	Only a partial PATS key was read. Go To Pinpoint Test D .
B1681	PATS Transceiver Module Signal is Not Received	The instrument cluster did not receive the PATS transceiver signal. Go To Pinpoint Test E .
B2103	Antenna Not Connected	There has been a PATS transceiver antenna failure. Go To Pinpoint Test A .
B2141	NVM Configuration Failure	There is no PCM ID stored in the instrument cluster. CARRY OUT a parameter reset of the instrument cluster and CYCLE the ignition 3-5 times, making an attempt to start the vehicle each key cycle.
B2431	Transponder Programming Failed	The ignition key was not programmed. PROGRAM the key. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
All other DTCs	—	REFER to Section 419-10 .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the instrument cluster	• Fuse(s) • Circuitry • Instrument cluster	• REFER to Section 418-00 .
• The anti-theft indicator is always/never on	• Anti-theft indicator • Instrument cluster	• Go To Pinpoint Test G .
• The vehicle does not start	• Circuitry • Passive anti-theft system (PATS) key • PATS transceiver • Powertrain control module (PCM)	• Go To Pinpoint Test H .

Pinpoint Tests

Pinpoint Test A: DTC B2103 — No Antenna Detected

Normal Operation

The passive anti-theft system (PATS) transceiver communicates with the PATS key. During each vehicle start sequence, the PATS transceiver reads the PATS key identification code and sends the data to the instrument cluster. The control functions are contained in the instrument cluster. The instrument cluster carries out all of the PATS functions such as receiving the identification code from the PATS key and controlling engine enable. The instrument cluster initiates the key interrogation sequence when the key is turned to the ON or START position.

DTC B2103 — sets when there has been a PATS transceiver antenna failure. The PATS transceiver may need to be replaced.

Possible Causes

- PATS transceiver

PINPOINT TEST A: DTC B2103 — ANTENNA NOT CONNECTED

Test Step	Result / Action to Take
A1 INSPECT THE PATS TRANSCEIVER FOR CORRECT INSTALLATION OR PHYSICAL DAMAGE	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the instrument cluster again. ● Key in OFF position. ● Verify the PATS transceiver is correctly installed. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. ● Enter the following diagnostic mode on the diagnostic tool: Clear Continuous DTCs. ● Key in OFF position. ● Key in ON position. ● Enter the following diagnostic mode on the diagnostic tool: Retrieve the Instrument Cluster DTCs. ● **Is DTC B2103 retrieved?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. REPEAT the self-test. TURN the ignition OFF then back to RUN. **No** The system is OK.

Pinpoint Test B: DTC B1600 — Passive Anti-Theft System (PATS) Ignition Key Transponder Signal Is Not Received

Normal Operation

The PATS transceiver communicates with the PATS key. During each vehicle start sequence, the PATS transceiver reads the PATS key identification code and sends the data to the instrument cluster. The control functions are contained in the instrument cluster. The instrument cluster carries out all of the PATS functions such as receiving the identification code from the PATS key and controlling engine enable. The instrument cluster initiates the key interrogation sequence when the key is turned to the ON or START position.

DTC B1600 — sets when no PATS key has been read by the instrument cluster.

Possible Causes

- PATS transceiver

- Instrument cluster
- Encoded PATS ignition key

PINPOINT TEST B: DTC B1600 — PATS IGNITION KEY TRANSPONDER SIGNAL IS NOT RECEIVED

NOTE: Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS ignition key may cause vehicle starting issues and record diagnostic trouble codes (DTCs) under certain conditions. If a fault cannot be identified, examine the customer's key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS ignition key while starting the engine. These objects and devices cannot damage the PATS ignition key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the ignition OFF and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the encoded ignition key used by the customer is a Ford approved PATS key. (PATS keys from Ford, Rotunda, Strattec, HUF are approved Ford PATS keys)

Test Step	Result / Action to Take
B1 CHECK THE DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Clear Continuous Instrument Cluster DTCs. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve the Instrument Cluster DTCs. • **Is DTC B1600 retrieved?**	**Yes** GO to B2 . **No** If other than PATS DTCs are retrieved, REFER to Section 413-01 . If other PATS DTCs are retrieved, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. If no PATS DTCs are retrieved, the system is OK.
B2 INSTALL A NEW ENCODED PATS IGNITION KEY	
NOTE: Check to make sure the customer and new encoded (contains a transponder) PATS ignition keys are Ford approved, encoded PATS ignition keys. Unapproved PATS keys do not always operate correctly over different temperature ranges. (Ford, Rotunda, Strattec and HUF are the only approved encoded PATS ignition key.) • Cut a new encoded ignition key. • Program the new encoded ignition key. Refer to Spare Key Programming — Using Diagnostic Equipment in this section. • Enter the following diagnostic mode on the diagnostic tool: Clear Instrument Cluster Continuous DTCs. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve the Instrument Cluster DTCs. • **Is DTC B1600 present?**	**Yes** GO to B3 . **No** If other than PATS DTCs are retrieved, REFER to Section 413-01 . If other PATS DTCs are retrieved, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. If no PATS DTCs are retrieved, one (or both) of the original PATS keys are defective. REPEAT the self-test with the original keys to determine if one (or both) keys are defective.
B3 INSTALL A NEW PATS TRANSCEIVER	
NOTE: Replacement of the PATS transceiver does	**Yes**

not require the PATS keys to be programmed into the instrument cluster again. **NOTE:** Do not use the PATS key that may have been programmed in Step B2. • Key in OFF position. • Install a new PATS transceiver. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Clear Instrument Cluster Continuous DTCs. • Key in OFF position. • Turn the key to the ON position using an existing customer PATS key. • Enter the following diagnostic mode on the diagnostic tool: Retrieve the Instrument Cluster DTCs. • **Is DTC B1600 retrieved?**	GO to B4 . **No** The system is OK.
B4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

NOTE: When a new instrument cluster is installed, the PATS keys must be programmed into the instrument cluster. **NOTE:** When a new instrument cluster is installed, the parameters must be reset in the instrument cluster and the powertrain control module (PCM).
• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . PROGRAM the PATS keys into the new instrument cluster. REFER to Key Programming Using Diagnostic Equipment in this section. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test C: DTC B1601 — The Passive Anti-Theft System (PATS) Received an Incorrect Key-Code From The Ignition Key Transponder

Normal Operation

The PATS transceiver communicates with the PATS key. During each vehicle start sequence, the PATS transceiver reads the PATS key identification code and sends the data to the instrument cluster. The instrument cluster will then send a message to the powertrain control module (PCM). The PCM will carry out the function of controlling engine enable. The instrument cluster initiates the key interrogation sequence when the key is turned to the ON or START position.

DTC B1601 — sets when there is an unprogrammed PATS key. The concern may not be with the PATS key itself, but possibly the key may need to be programmed into the PATS memory (unless the maximum number of keys are already programmed).

Possible Causes

- PATS key
- PATS transceiver
- Instrument cluster

PINPOINT TEST C: DTC B1601 — PATS RECEIVED INCORRECT KEY-CODE FROM IGNITION KEY TRANSPONDER

NOTE: The PCM disables the engine for 1 second every time DTC B1601 is set. The ignition must remain in the RUN position for at least 1 second before an attempt is made to start the vehicle with any encoded ignition key. Check the instrument cluster PID ANTISCAN for this unprogrammed key time-out status.

NOTE: Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key may cause vehicle starting concerns and record diagnostic trouble codes (DTCs) under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the ignition switch off and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the PATS key used by the customer is an approved Ford PATS key (PATS keys from Ford, Rotunda, Strattec, HUF are approved Ford PATS keys).

NOTE: Only 8 PATS keys can be programmed into the instrument cluster during normal programming procedures (unless the unlimited key mode is enabled). If the N_KEYCODE PID reads more than 2 and less than 8, the concern may be the PATS key being used is an unprogrammed key. Verify this by also viewing the MASTERKEY PID. It must read PRESNT for the key to be valid.

Test Step	Result / Action to Take
C1 RETRIEVE THE DTCs • Enter the following diagnostic mode on the diagnostic tool: Clear the Instrument Cluster Continuous DTCs. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve the Instrument Cluster DTCs . • **Is DTC B1601 retrieved?**	**Yes** GO to C2 . **No** The system is OK. CHECK all customer encoded PATS ignition keys by attempting to start the vehicle with each key to VERIFY all other encoded PATS ignition keys are programmed.
C2 CHECK FOR PROGRAMMED ENCODED IGNITION KEYS — MONITOR THE INSTRUMENT CLUSTER PID N_KEYCODE • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PIDs. • Monitor the instrument cluster PID N_KEYCODE. • **Does the instrument cluster PID N_KEYCODE display 8?**	**Yes** ERASE and REPROGRAM the keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to C3 .
C3 CHECK THE NUMBER OF PROGRAMMED ENCODED IGNITION KEYS AVAILABLE • Verify there are at least 2 currently programmed encoded PATS ignition keys available with the vehicle. • **Are at least 2 currently programmed encoded PATS ignition keys available with the vehicle?**	**Yes** GO to C4 . **No** CUT a new encoded PATS ignition key so that at least 2 encoded PATS ignition keys are available. PROGRAM the encoded PATS ignition keys. REFER to Key Programming Using Diagnostic Equipment in this section. GO to C5 .
C4 VERIFY THE INSTRUMENT CLUSTER PID	

SPAREKEY INDICATES YES	
• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Monitor the instrument cluster PID SPAREKEY. • **Does the instrument cluster PID SPAREKEY indicate ENABLE?**	**Yes** Spare key programming is enabled. REFER to Key Programming Using Two Programmed Keys in this section. CLEAR the DTCs. REPEAT the self-test. **No** ENABLE the instrument cluster PID SPAREKEY. REFER to Key Programming Switch State Control in this section. CLEAR the DTCs. REPEAT the self-test.
C5 CHECK THE ENCODED PATS IGNITION KEYS FOR CORRECT OPERATION	
• Key in OFF position. • Turn the key to ON for 3 seconds using the first encoded PATS ignition key. • Key in ON position. • Turn the key to ON for 3 seconds using the second PATS ignition key. • Start the vehicle using the second encoded PATS ignition key. • **Does the vehicle start?**	**Yes** The system is OK. If there are additional keys that need to be programmed, REFER to Key Programming Using Two Programmed Keys in this section. **No** GO to C6.
C6 RETRIEVE THE DTCs — CHECK FOR DTC B1601	
• Enter the following diagnostic mode on the diagnostic tool: Clear the Instrument Cluster Continuous DTCs. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve the Instrument Cluster DTCs. • **Is DTC B1601 retrieved?**	**Yes** GO to C7. **No** If other than PATS DTCs are retrieved, REFER to Section 413-01. If other PATS DTCs are retrieved, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. If no PATS DTCs are retrieved, the system is OK.
C7 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

NOTE: When a new instrument cluster is installed, the PATS keys must be programmed into the instrument cluster. **NOTE:** When a new instrument cluster is installed, the parameters must be reset in the instrument cluster and the powertrain control module (PCM).
• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01. PROGRAM the PATS keys into the new instrument cluster. REFER to Key Programming Using Diagnostic Equipment in this section. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test D: DTC B1602 — PATS Received Invalid Format Of Key-Code From Ignition Key

Transponder

Normal Operation

The PATS transceiver communicates with the PATS key. During each vehicle start sequence, the PATS transceiver reads the PATS key identification code and sends the data to the instrument cluster. The instrument cluster will then send a message to the powertrain control module (PCM) to control the engine enable. The instrument cluster initiates the key interrogation sequence when the key is turned to the ON or START position.

DTC B1602 — sets when only a partial PATS key was read. Remote starter equipment can also cause this diagnostic trouble code (DTC).

Possible Causes

- PATS key
- PATS transceiver
- Instrument cluster

PINPOINT TEST D: DTC B1602 — PATS RECEIVED INVALID FORMAT OF KEY-CODE FROM IGNITION KEY TRANSPONDER

NOTE: Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key may cause vehicle starting concern and record diagnostic trouble codes (DTCs) under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the ignition off and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the PATS key used by the customer is an approved Ford PATS key (PATS keys from Ford, Rotunda, Strattec, HUF are approved Ford PATS keys).

NOTE: Only 8 PATS keys can be programmed into the instrument cluster during normal programming procedures (unless the unlimited key mode is enabled). If the N_KEYCODE PID reads more than 2 and less than 8, the concern may be the PATS key being used is an unprogrammed key. Verify this by also viewing the MASTERKEY PID. It must read PRESNT for the key to be valid.

NOTE: Make sure any aftermarket remote start systems have been removed from the vehicle before any PATS-related no-start concerns are investigated.

Test Step	Result / Action to Take
D1 RETRIEVE THE DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Clear the Instrument Cluster Continuous DTCs . • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve the Instrument Cluster DTCs. • **Is DTC B1602 retrieved?**	**Yes** GO to D2 . **No** The system is OK. CHECK all the customer PATS keys by attempting to start the vehicle with each key to VERIFY all other PATS keys are programmed.
D2 INSTALL A NEW ENCODED PATS IGNITION KEY	
NOTE: Check to make sure the customer and new encoded PATS ignition keys are approved, encoded PATS ignition keys. Unapproved PATS keys do not always operate correctly over different	**Yes** GO to D3 . **No**

temperature ranges. (PATS keys from Ford, Rotunda, Strattec, HUF are approved Ford PATS keys) • Cut a new encoded PATS ignition key. • Program a new encoded PATS ignition key. Refer to Spare Key Programming — Using Diagnostic Equipment in this section. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve the Instrument Cluster DTCs. • **Is DTC B1602 retrieved?**	If other than PATS DTCs are retrieved, REFER to Section 413-01 . If other PATS DTCs are retrieved, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. If no PATS DTCs are retrieved, the system is OK.
D3 INSTALL A NEW PATS TRANSCEIVER	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the instrument cluster again. • Enter the following diagnostic mode on the diagnostic tool: Clear Instrument Cluster Continuous DTCs. • Key in OFF position. • Install a new PATS transceiver. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve the Instrument Cluster DTCs. • **Are any PATS DTCs retrieved?**	**Yes** GO to D4 . **No** The system is OK.
D4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

NOTE: When a new instrument cluster is installed, the PATS keys must be programmed into the new instrument cluster. **NOTE:** When a new instrument cluster is installed, the parameters must be reset in the instrument cluster and the powertrain control module (PCM).
• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . PROGRAM the PATS keys into the new instrument cluster. REFER to Key Programming Using Diagnostic Equipment in this section. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test E: DTC B1681 — PATS Transceiver Module Signal Is Not Received

Refer to Wiring Diagrams Cell 112 , Passive Anti-Theft System for schematic and connector information.

Normal Operation

The PATS transceiver receives voltage on circuit CBP36 (BU/BN) and ground on circuit GD133 (BK). The PATS transceiver communicates with the PATS key. During each vehicle start sequence, the PATS transceiver reads the PATS key identification code and sends the data to the instrument cluster. The instrument cluster and the PATS transceiver communicate on circuits VRT07 (VT/BN) and VPL56 (BU/GY). The instrument cluster then sends a message to the powertrain control module (PCM) to

control the engine enable. The instrument cluster initiates the key interrogation sequence when the key is turned to the ON or START position.

Possible Causes

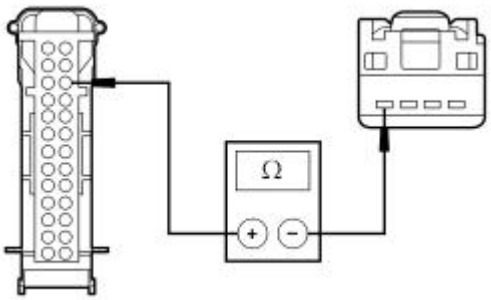
- Fuse
- Circuit GD133 (BK) open
- Circuit CBP36 (BU/BN) open
- Circuit VRT07 (VT/BN) open or short to voltage
- Circuit VPL56 (BU/GY) open or short to ground
- Encoded PATS ignition key
- PATS transceiver
- Instrument cluster

PINPOINT TEST E: DTC B1681 — PATS TRANSCEIVER MODULE SIGNAL IS NOT RECEIVED

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
E1 RETRIEVE THE DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Clear the Instrument Cluster Continuous DTCs. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve the Instrument Cluster DTCs. • **Is DTC B1681 retrieved?**	**Yes** GO to E2 . **No** The system is OK.
E2 CHECK THE PATS TRANSCEIVER CIRCUIT CBP36 (BU/BN) FOR VOLTAGE	
• Key in OFF position. • Disconnect: PATS Transceiver C2007. • Key in ON position. • Measure the voltage between the PATS transceiver C2007-1, circuit CBP36 (BU/BN), harness side and ground.  N0002393 • **Is the voltage greater than 10 volts?**	**Yes** GO to E3 . **No** VERIFY the smart junction box (SJB) fuse 36 (5A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
E3 CHECK THE PATS TRANSCEIVER GROUND CIRCUIT GD133 (BK)	
• Key in OFF position. • Measure the resistance between the PATS transceiver C2007-2, circuit GD133 (BK), harness side and ground.	**Yes** GO to E4 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system

 N0002394 • **Is the resistance less than 5 ohms?**	for normal operation.
E4 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT VPL56 (BU/GY) FOR VOLTAGE	
• Connect: PATS Transceiver C2007. • Key in ON position. • Measure the voltage by backprobing between the PATS transceiver C2007-4, circuit VPL56 (BU/GY), harness side and ground.  N0002398 • **Is the voltage greater than 9 volts?**	**Yes** GO to E6 . **No** GO to E5 .
E5 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT VPL56 (BU/GY) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: PATS Transceiver C2007. • Disconnect: Instrument Cluster C220. • Measure the resistance between the PATS transceiver C2007-4, circuit VPL56 (BU/GY), harness side and ground.  N0002400 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. If the DTC sets again, GO to E13 .
E6 CHECK CIRCUIT VPL56 (BU/GY) FOR AN OPEN	
• Key in OFF position. • Disconnect: PATS Transceiver C2007. • Disconnect: Instrument Cluster C220. • Measure the resistance between the instrument cluster C220-24, circuit VPL56 (BU/GY), harness side and the PATS transceiver C2007-4, circuit VPL56 (BU/GY), harness side.	**Yes** GO to E7 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.



N0027762

- **Is the resistance less than 5 ohms?**

E7 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT07 (VT/BN) FOR VOLTAGE	
• Key in OFF position. • Connect: PATS Transceiver C2007. • Connect: Instrument Cluster C220. • Key in ON position. • Measure the voltage by backprobing between the PATS transceiver C2007-3, circuit VRT07 (VT/BN), harness side and ground.  N0002395 • **Is the voltage greater than 9 volts?**	**Yes** GO to E11 . **No** GO to E8 .
E8 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT07 (VT/BN) FOR A SHORT TO GROUND WITH THE TRANSCEIVER CONNECTED	
• Key in OFF position. • Disconnect: Instrument Cluster C220. • Measure the resistance between the instrument cluster C220-25, circuit VRT07 (VT/BN), harness side and ground.  N0056313 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E10 . **No** GO to E9 .
E9 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT07 (VT/BN) FOR A SHORT TO GROUND WITH THE TRANSCEIVER DISCONNECTED	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the instrument cluster again.	**Yes** INSTALL a new PATS transceiver. REFER to

• Disconnect: PATS Transceiver C2007. • Measure the resistance between the PATS transceiver C2007-3, circuit VRT07 (VT/BN), harness side and ground.  N0002396 • **Is the resistance greater than 10,000 ohms?**	Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
E10 CHECK THE PATS TRANSMIT CIRCUIT VRT07 (VT/BN) FOR AN OPEN	
• Disconnect: PATS Transceiver C2007. • Measure the resistance between the instrument cluster C220-25, circuit VRT07 (VT/BN), harness side and the PATS transceiver C2007-3, circuit VRT07 (VT/BN), harness side.  N0027763 • **Is the resistance less than 5 ohms?**	**Yes** GO to E13 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
E11 CHECK THE TRANSCEIVER TRANSMIT CIRCUIT VRT07 (VT/BN) FOR VOLTAGE	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Active Command. • Select PCM active command TRANSMIT SIGNAL COMMAND. • Trigger TRANSMIT to ON. • While backprobing, measure the voltage between the PATS transceiver C2007-3, circuit VRT07 (VT/BN), harness side and ground.  N0002395 • **Is the voltage less than 5 volts?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. TEST the system for normal operation. **No** GO to E12 .
E12 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT07 (VT/BN) FOR A SHORT TO VOLTAGE	
• Key in OFF position.	**Yes**

• Disconnect: Instrument Cluster C220. • Disconnect: PATS Transceiver C2007. • Key in ON position. • Measure the voltage between the PATS transceiver C2007-3, circuit VRT07 (VT/BN), harness side and ground.  N0002835 • **Is voltage present?**	REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation. **No** GO to E13 .
E13 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

NOTE: When a new instrument cluster is installed, the PATS keys must be programmed into the new instrument cluster.
NOTE: When a new instrument cluster is installed, the parameters must be reset in the instrument cluster and the powertrain control module (PCM).
• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . PROGRAM the PATS keys into the new instrument cluster. REFER to Key Programming Using Diagnostic Equipment in this section. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test F: DTC B1213 — Anti-Theft Number Of Programmed Keys Is Below Minimum

Normal Operation

The passive anti-theft system (PATS) transceiver communicates with the PATS key. During each vehicle start sequence, the PATS transceiver reads the PATS key identification code and sends the data to the instrument cluster. The instrument cluster will then send a message to the powertrain control module (PCM) which will control the engine enable. The instrument cluster initiates the key interrogation sequence when the key is turned to the ON or START position.

DTC B1213 — sets when the number of programmed keys is below the minimum of 2 keys. If there is only 1 key or no keys programmed into the instrument cluster and the key is cycled to the ON position, DTC B1213 will set in the instrument cluster.

Possible Causes

- Encoded PATS ignition key

PINPOINT TEST F: DTC B1213 — ANTI-THEFT NUMBER OF PROGRAMMED KEYS IS BELOW MINIMUM

Test Step	Result / Action to Take
F1 RETRIEVE THE DTCs • Enter the following diagnostic mode on the diagnostic tool: Clear the Instrument Cluster Continuous DTCs . • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve the Instrument Cluster DTCs. • **Is DTC B1213 retrieved?**	**Yes** GO to F2 . **No** If other than PATS DTCs are retrieved, REFER to Section 413-01 . If other PATS DTCs are retrieved, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. If no PATS DTCs are retrieved, the system is OK.
F2 CHECK THE NUMBER OF KEYS PROGRAMMED — MONITOR THE INSTRUMENT CLUSTER PID N_KEYCODE • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Monitor the instrument cluster PID N_KEYCODE. • **Does the instrument cluster PID N_KEYCODE display less than the instrument cluster PID MIN_KEY?**	**Yes** GO to F3 . **No** The system is OK.
F3 PROGRAM THE PATS IGNITION KEYS • **NOTE:** Two programmed encoded PATS ignition keys must be available to start the vehicle. • Cut a new encoded PATS ignition lock cylinder key. • Program the new encoded PATS ignition key. Refer to Spare Key Programming — Using Diagnostic Equipment in this section. • **Does the theft LED illuminate for 3 seconds and then go out?**	**Yes** CLEAR the DTCs. CYCLE the ignition OFF then back to RUN to VERIFY all DTCs have been cleared. CLEAR the DTCs. REPEAT the self-test. **No** GO to F4 .
F4 CHECK FOR A REPAIR MODULE — MONITOR THE PCM PID SERV_MOD • Monitor the PCM PID SERV_MOD. • **Does the PCM PID SERV_MOD indicate YES?**	**Yes** PROGRAM the encoded PATS ignition keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. **No** If the LED is illuminated continuously, REPEAT Step F3 using a new encoded PATS ignition key, by cutting a new key and programming it. If the LED is flashing, RETRIEVE the instrument cluster DTC(s) stored for the new PATS fault. REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section.

Pinpoint Test G: The Anti-Theft Indicator Is Always/Never On

Normal Operation

The passive anti-theft system (PATS) uses a visual anti-theft indicator located in the instrument cluster. This indicator proves out for 3 seconds when the key is turned to ON or START under normal operation. If there is a PATS issue, this indicator either flashes rapidly or glows steadily (for more than 3 seconds) when the key is turned to ON or START. PATS also flashes the anti-theft indicator every 2 seconds at ignition OFF to act as a visual theft deterrent.

Possible Causes

- Anti-theft indicator
- Instrument cluster

PINPOINT TEST G: THE ANTI-THEFT INDICATOR IS ALWAYS/NEVER ON

Test Step	Result / Action to Take
G1 CHECK THE ANTI-THEFT INDICATOR FOR CORRECT OPERATION **NOTE:** When a new instrument cluster is installed, the PATS keys must be programmed into the new instrument cluster. **NOTE:** When a new instrument cluster is installed, the parameters must be reset in the instrument cluster and the powertrain control module (PCM). • Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Commands. • Operate the active command ALL LAMPS to ON, then OFF. • **Does the anti-theft indicator illuminate, then turn off?**	**Yes** GO to G2 . **No** INSTALL a new instrument cluster. REFER to Section 413-01 . PROGRAM the PATS keys into the new instrument cluster. REFER to Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test.

G2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION
NOTE: When a new instrument cluster is installed, the PATS keys must be programmed into the new instrument cluster. **NOTE:** When a new instrument cluster is installed, the parameters must be reset in the instrument cluster and the powertrain control module (PCM).
• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . PROGRAM the PATS keys into the new instrument cluster. REFER to Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test H: The Vehicle Does Not Start

Refer to Wiring Diagrams Cell 112 , Passive Anti-Theft System for schematic and connector information.

Normal Operation

During each vehicle start sequence, the passive anti-theft system (PATS) transceiver reads the PATS key identification code and sends the data to the instrument cluster, which then sends a message to the powertrain control module (PCM) to enable the injectors and the starter. The PCM grounds the starter relay solenoid coil on circuit CDC12 (YE).

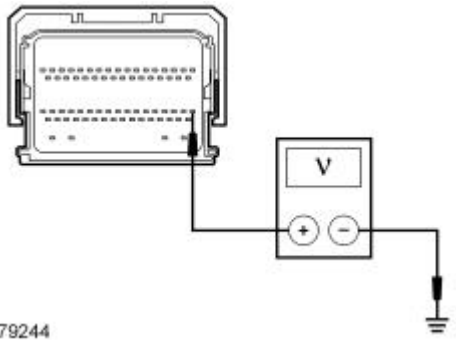
Possible Causes

- Circuit CDC12 (YE) open
- PATS transceiver
- PATS key
- PCM

PINPOINT TEST H: THE VEHICLE DOES NOT START

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
H1 CHECK THE STARTING SYSTEM FOR CORRECT VOLTAGE	
• Key in OFF position. • Disconnect: PCM C175B. • Key in START position. • With the key in the START position, measure the voltage between the PCM C175b-34, circuit CDC12 (YE), harness side and ground.  A0079244 • **Is the voltage less than 8 volts?**	**Yes** DIAGNOSE the starting system. REFER to Section 303-06 . **No** GO to H2 .
H2 CHECK THE STARTING SYSTEM GROUND	
• Measure the voltage between the PCM C175b-34, circuit CDC12 (YE), harness side and ground.	**Yes** DIAGNOSE the starting system. REFER to Section 303-06 . **No** GO to H3 .



- **Is the voltage less than 2 volts?**

H3 CHECK FOR CORRECT POWERTRAIN CONTROL MODULE (PCM) OPERATION	

NOTE: When a new PCM is installed, the parameters must be reset in the instrument cluster and the PCM.
• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . RESET the PATS parameters in the PCM and the instrument cluster. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Key Programming Using Two Programmed Keys

Printable View (81 KB)

NOTE: This procedure works only if 2 or more programmed ignition keys are available. If 2 programmed keys are not available, refer to Key Programming Using Diagnostic Equipment in this section.

NOTE: The PID SPAREKEY must be enabled for this procedure to operate. If this PID is not enabled, refer to Key Programming Switch State Control in this section, then select SPAREKEY programming switch; ENABLED. The PID SPAREKEY is set to ENABLE when the vehicle is built.

NOTE: If the programming procedure is successful, the new key(s) will start the vehicle and the anti-theft indicator will prove-out for approximately 3 seconds. If the programming procedure is not successful and the new key(s) does not start the engine, leave the key in the ON position for at least 3 seconds, then turn the key off. Repeat the key programming procedure from Step 1. If the failure repeats, refer to Anti-Theft in the Diagnosis and Testing portion of this section to review the DTCs and carry out the appropriate pinpoint tests.

NOTE: A maximum of 8 passive anti-theft system (PATS) keys can be programmed into the instrument cluster during this programming procedure, but only if the PID SPAREKEY is ENABLED.

NOTE: A minimum of 2 PATS keys must be programmed into the instrument cluster before the vehicle will start.

NOTE: If the vehicle is in unlimited key mode, this spare key programming procedure still functions. Any 2 keys that can start the vehicle can be used to program an additional unlimited key.

NOTE: If additional keys are to be programmed, and the remaining keys are with the customer, or are not available, instruct the customer to refer to the Owner's Literature for instructions on programming the remaining keys. In this case, the PID SPAREKEY must be enabled.

NOTE: If the steps are not carried out as outlined, the programming procedure will end.

NOTE: Ignition keys must have a correct mechanical key cut for the vehicle and must be PATS encoded keys (contain a transponder).

NOTE: This procedure is not necessary if only the PATS transceiver was replaced. Replacement of the transceiver does not erase the PATS key codes in the instrument cluster.

1. Insert the first programmed key into the ignition lock cylinder and turn the key from the OFF position to the ON position (maintain the key in the ON position for a minimum of 3 seconds and less than 10 seconds).

2. Turn the key to the OFF position and remove the first key from the ignition lock cylinder.

3. Within 5 seconds of turning the key to the OFF position, insert the second programmed key into the ignition lock cylinder and turn the key from the OFF position to the ON position (maintain the key in the ON position for a minimum of 3 seconds and less than 10 seconds).

4. Turn the key to the OFF position and remove the key from the ignition lock cylinder.

5. Within 10 seconds of turning the key to the OFF position, insert the unprogrammed key (the new key) into the ignition lock cylinder and turn the key from the OFF position to the ON position (maintain the key in the ON position for a minimum of 3 seconds and less than 10 seconds).

6. If it is desired to program additional key(s) (only up to 8 keys total can be programmed into the

instrument cluster), repeat Steps 1 - 5 for each additional key that needs to be programmed.

7. Start the vehicle with the new key(s).

Key Programming Using Diagnostic Equipment

Printable View (86 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: This procedure is used when a customer needs keys programmed into the system and does not have 2 programmed ignition keys available. This procedure is also useful when a programmed ignition key(s) is lost or the ignition lock cylinder is replaced, and it is desired to erase key code(s) from the passive anti-theft system (PATS) memory.

NOTE: This procedure erases all programmed ignition keys from the vehicle memory. The vehicle will not start until a minimum of 2 keys are programmed to the vehicle.

NOTE: A minimum of 2 PATS keys must be programmed into the instrument cluster before the vehicle will start.

NOTE: Two PATS encoded (contains a transponder) keys with the correct mechanical cut must be available to carry out this procedure. One or both of them may be the customer's original keys.

NOTE: If additional keys are to be programmed, refer to Key Programming Using Two Programmed Keys in this section. If the remaining keys are with the customer and are not available with the vehicle, instruct the customer to refer to the Owner's Literature for instructions on programming the remaining keys. In this case, the PID SPAREKEY must be enabled.

NOTE: This procedure is not necessary if only the PATS transceiver was replaced. Replacement of the transceiver does not erase the PATS key codes in the instrument cluster.

1. Turn the key from the OFF position to the ON position.
2. From the scan tool, follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.
3. From the scan tool menu select: "Ignition Key Code Erase" and press the tick mark.
4. Turn the key to the OFF position and disconnect the scan tool.
5. Insert the first PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds.
6. Turn the first PATS key to the OFF position and remove the key from the ignition lock cylinder.
7. Insert the next PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds.
8. The vehicle should now start with both PATS ignition keys.

9. If it is desired to program additional key(s) (only up to 8 keys total can be programmed into the instrument cluster), refer to Key Programming Using Two Programmed Keys in this section for each additional key that needs to be programmed.

Key Programming Switch State Control

Printable View (85 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: The spare key programming switch is a programmable switch which provides the capability to enable/disable the normal customer spare key programming procedure detailed in the Owner's Literature. It must read ENABLE if more than 2 keys need to be programmed into the instrument cluster. For additional information, refer to Key Programming Using Two Programmed Keys in this section. This programmable switch is provided as a convenience for rental company fleets or other fleet purchasers who may not want the spare key programming procedure available to the vehicle driver.

NOTE: The spare key programming switch state can be viewed with the instrument cluster PID SPAREKEY.

NOTE: If the SPAREKEY PID reads ENABLE, up to 8 keys total can be programmed into the instrument cluster. For additional information, refer to Key Programming Using Two Programmed Keys in this section. If the SPAREKEY PID reads DISABLED, the key programming using two programmed keys procedure will not function. This switch is set to ENABLE when the vehicle is built. This PID does not affect the key programming using diagnostic equipment procedure or the spare key programming — unlimited key mode procedure.

1. Insert a programmed passive anti-theft system (PATS) key into the ignition lock cylinder and turn the key from the OFF position to the ON position.

2. From the scan tool, follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

3. **NOTE:** The default setting on delivery of all new vehicles is ENABLE.

   From the scan tool menu select: "Customer Spare Key Programming Enable" (or "Customer Spare Key Programming Disable") and press the tick mark.
   - "Customer Spare Key Programming Enable" — spare key programming procedure is accessible.
   - "Customer Spare Key Programming Disable" — spare key programming procedure is not accessible.

Spare Key Programming — Using Diagnostic Equipment

Printable View (85 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: This procedure is used when a customer needs to have an additional key programmed into the vehicle without erasing stored key codes, but does not have 2 programmed keys available. This procedure is also useful when attempting to determine if an ignition key is damaged, as a new key can be installed without erasing keys or without having 2 programmed keys available.

NOTE: Before programming, the new key must have the correct mechanical cut for the ignition lock cylinder.

NOTE: If 8 keys are already programmed, this procedure does not allow any more ignition keys to be programmed. The number of keys that are programmed into the passive anti-theft system (PATS) can be determined by viewing the N_KEYCODE PID.

1. Turn the unprogrammed PATS key from the OFF position to the ON position.
2. From the scan tool, follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.
3. **NOTE:** Make sure the selection made is "PROGRAM". If the "ERASE" selection is made, all of the keys will be erased from the system.

   From the scan tool menu select: "Program additional ignition key" and press the tick mark.
4. Turn the key to the OFF position and disconnect the scan tool.
5. Start the vehicle with the new PATS key. The vehicle will now start with the new PATS key and also with the original PATS keys.

Spare Key Programming — Unlimited Key Mode

Printable View (90 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Enabling Unlimited Key Mode

NOTE: Unlimited key mode is intended for use by those customers who need more than 8 keys for their vehicle.

NOTE: Before programming, the new key(s) must have the correct mechanical cut for the ignition lock cylinder.

NOTE: The unlimited key mode is set up by creating a special, unique unlimited transponder security key code and programming this key code into all of the vehicle keys so they contain the same key code.

1. The customer must choose an 8-digit number (except for 00000000 or 00000001) to be programmed to all of their vehicles. All customer vehicles need to use the same number. Valid digits are 0-9 and the letters A-F.

2. **NOTE:** If the PID UNL_KEY is not available, unlimited key mode is turned on, and must be turned off before viewing the stored code. At this time, unlimited keys may be programmed to the vehicle. To view/change the stored code, follow the procedure for disabling the unlimited key mode below.

   Monitor the PID UNL_KEY and compare its value against the code chosen in Step 1. It should not be the same key code.

3. From the scan tool, follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

4. Once in security access, if the unlimited transponder security key PID is 00000000 or 00000001, select: "program unlimited key code" and press the tick mark. Enter the 8-digit code chosen by the customer in Step 1 of this procedure and press the tick mark.

5. Select: "unlimited key mode ON" and press the tick mark.

6. Select: "Ignition Key Code Erase" and press the tick mark.

7. Disconnect the scan tool and turn the ignition switch to OFF.

8. Insert the first PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds.

9. Remove the first PATS key from the ignition lock cylinder.

10. Insert the next PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds.

11. If it is desired to program additional key(s), refer to Key Programming Using Two Programmed Keys in this section for each additional key that needs to be programmed.

Disabling Unlimited Key Mode

NOTE: By disabling the unlimited key mode with a random 8-digit number, the previous access code no longer operates the vehicle.

1. From the scan tool, follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

2. Select: "unlimited key mode OFF" and press the tick mark.

3. Select: "Ignition Key Code Erase" and press the tick mark.

4. Disconnect the scan tool and turn the ignition switch to OFF.

5. Insert the first PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds.

6. Turn the first PATS key to the OFF position and remove the key from the ignition lock cylinder.

7. Insert the next PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds.

8. **NOTE:** With the unlimited key mode turned off, a maximum of 8 keys can be programmed into the instrument cluster using the Key Programming Using Two Programmed Keys procedure in this section. The PID SPAREKEY must be enabled.

   If it is desired to program additional key(s), refer to Key Programming Using Two Programmed Keys in this section for each additional key that needs to be programmed. The PID SPAREKEY must be enabled.

Passive Anti-Theft System (PATS) Parameter Reset

Printable View (85 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: When using the IDS, the instrument cluster and the powertrain control module (PCM) parameters are reset at the same time.

NOTE: Once security access has been granted, multiple security access commands should be executed (if necessary) prior to exiting the command menu. This avoids an additional security access procedure and the associated 10 minute time delay.

1. Turn the key from the OFF position to the ON position.
2. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.
3. From the scan tool, select: Parameter Reset and press the tick mark.
4. **NOTE:** If the instrument cluster was replaced, follow Steps 4-9. If the instrument cluster and the PCM were replaced, follow Steps 4-9. If only the PCM was replaced, go to Step 9.

   From the scan tool, select: Ignition Key Code Erase and press the tick mark.
5. Turn the key to the OFF position and disconnect the scan tool.
6. Turn the key to the ON position for a minimum of 3 seconds.
7. Turn the key to the OFF position and remove the key.
8. Insert the second key into the ignition lock cylinder and turn the key to the ON position for a minimum of 3 seconds.
9. Both keys will now start the vehicle.
10. If more keys are required to be programmed, refer to Key Programming Using Two Programmed Keys in this section.

Anti-Theft Security Access

Printable View (85 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: This procedure is used to obtain passive anti-theft system (PATS) security access. PATS security access must be granted to erase ignition key codes, program ignition key codes, enable/disable unlimited key mode, set unlimited transponder key ID, reset parameters and enable/disable the spare key programming switch (PID SPAREKEY). The anti-theft security access procedure invokes a 10-minute time delay prior to granting security access during which the scan tool must remain connected to the vehicle. Once security access is granted, a security access command menu is displayed which offers various command options.

NOTE: Once security access has been granted, multiple security access commands should be executed (if necessary) prior to exiting the command menu. This avoids an additional security access procedure and the associated 10 minute time delay.

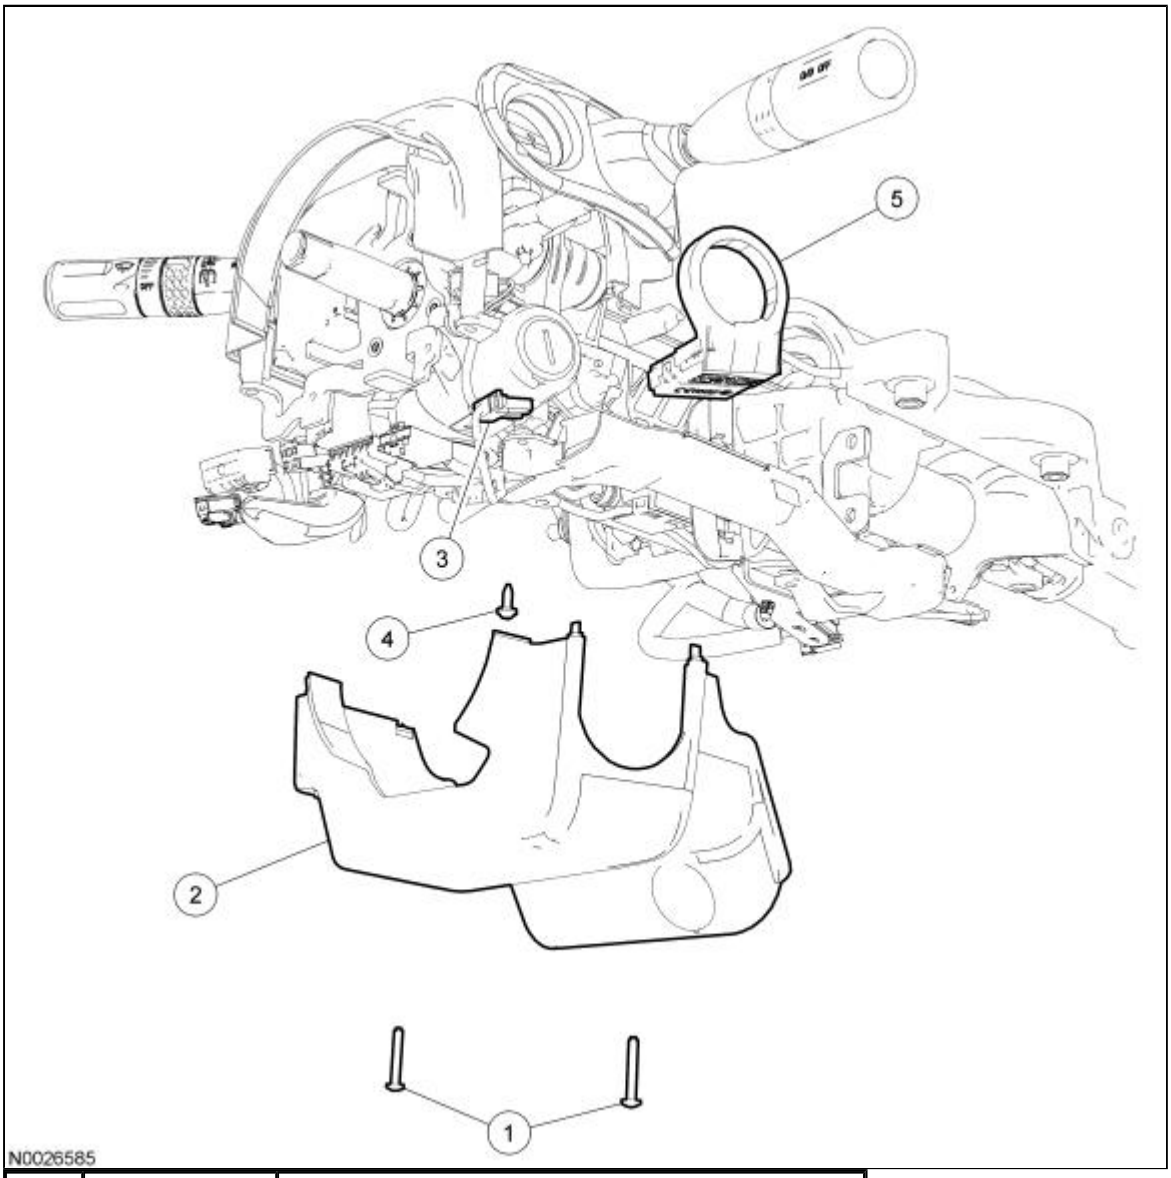
1. Turn the PATS key from the OFF position to the ON position.

2. From the scan tool, follow the on-screen instructions to ENTER SECURITY ACCESS. This procedure takes approximately 10 minutes to carry out, during which time the ignition switch must be in the ON position and the scan tool must be connected to the vehicle.

3. After the 10-minute security access procedure is completed, press the tick mark and a new menu is displayed with command options. Select only those functions required before exiting out of this menu. Do not select more functions than the procedure calls for. Once exited out of this menu, the security access procedure must be repeated again to carry out additional commands.

Passive Anti-Theft System (PATS) Transceiver

Printable View (199 KB)



Item	Part Number	Description
1	N805911-S	Steering column shroud screws (2 required)
2	3533	Lower steering column shroud
3	14401	PATS transceiver electrical connector
4	—	PATS transceiver screw
5	19A481	PATS transceiver

Removal and Installation

1. Remove the steering wheel. For additional information, refer to Section 211-04 .
2. Remove the 2 screws and the lower steering column shroud.

3. Remove the ignition lock cylinder cover.

4. Disconnect the PATS transceiver electrical connector.

5. Remove the screw and the PATS transceiver.

6. **NOTE:** Replacement of the PATS transceiver does not require the PATS keys to be programmed into the instrument cluster again.

   To install, reverse the removal procedure.

Universal Transmitter

Printable View (62 KB)

The universal transmitter is an integral part of the LH sun visor and provides a convenient way to substitute up to 3 hand-held transmitters with a single built-in device. The universal transmitter can learn the radio frequency codes of most current transmitters. The universal transmitter:

- operates garage doors, gates and home/office lighting and security systems.
- learns and transmits the radio frequency of up to 3 hand-held transmitters from any of the systems mentioned above.
- is powered by the vehicle battery and charging system.

Universal Transmitter

Printable View (68 KB)

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
• Universal transmitter • Receiver

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the fault is not visually evident, verify the symptom. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The universal transmitter is inoperative	• Universal transmitter • Receiver unit	• Go To Pinpoint Test A .

Pinpoint Tests

Pinpoint Test A: The Universal Transmitter is Inoperative

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The universal transmitter receives voltage on circuit CLN09 (YE/GN) and ground on circuit GD150 (BK/WH).

Possible Causes

- Receiver unit
- Universal transmitter

PINPOINT TEST A: THE UNIVERSAL TRANSMITTER IS INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK LEFT VANITY MIRROR OPERATION	
• Check the illumination of the left vanity mirror lamps. • **Do the left vanity mirror lamps illuminate?**	**Yes** GO to A2 . **No** REFER to Section 417-02 .
A2 PROGRAM A HAND-HELD TRANSMITTER INTO UNIVERSAL TRANSMITTER	
• **NOTE:** If the garage door is equipped with rolling codes, refer to Training a Garage Door Opener Equipped With "Rolling Codes" in this section. • Program the universal transmitter. Refer to Universal Transmitter Programming in this section. • **Did the universal transmitter program successfully?**	**Yes** The universal transmitter is OK. VERIFY the receiver operates correctly. **No** INSTALL a new LH sun visor assembly. REFER to Section 501-05 , Headliner. TEST the system for normal operation.

Universal Transmitter Programming

Printable View (82 KB)

WARNING: A garage door opening system that cannot stop or reverse itself after detecting an object in its path does not meet current federal safety standards. To decrease the risk of serious injury or death, do not use this universal transmitter with a door opening system that lacks stop and reverse features as required by federal standards. This includes any garage door opening system manufactured before April 1, 1982. Failure to follow these instructions may result in personal injury.

1. Verify the hand-held transmitter is operative.
2. Prepare for programming the universal transmitter by erasing all 3 channels by holding down the 2 outside buttons until the red light begins to flash (20-30 seconds). Release both buttons.
3. Select 1 of the 3 universal transmitter channels to be programmed by pressing the desired button.
4. Hold the end of the hand-held transmitter 25-51 mm (1-2 in) from the front surface of the universal transmitter so that the red light can still be seen.
5. **NOTE:** During programming, the hand-held transmitter may automatically stop transmitting after 2 seconds, which may not be long enough to program the universal transmitter. If programming this type of hand-held transmitter, continue to hold the button on the universal transmitter while pressing the hand-held transmitter button every 2 seconds.

   Use both hands to press the hand-held transmitter button and the desired button on the universal transmitter. Do not release either button.
6. Hold down both buttons until the red light on the universal transmitter flashes, first slowly and then rapidly. Release both buttons when the rapid flashing begins. The universal transmitter has successfully learned the new frequency signal and can be used in place of the hand-held transmitter(s).
7. To operate, press the appropriate button on the universal transmitter. The red light is on while the signal is being transmitted.
8. To program additional hand-held transmitters repeat Steps 3-6.

Training a Garage Door Opener Equipped With "Rolling Codes"

1. Program the hand-held transmitter to the universal transmitter.
2. Train the garage door opener receiver to recognize the universal transmitter.
   1. Remove the cover panel from the garage door opener receiver.
   2. Locate the training button on the garage door opener receiver. Location and color of the button may vary by garage door opener manufacturer. Refer to the garage door opener instruction manual.
   3. Press the training button on the garage door opener receiver for 1-2 seconds.
   4. Press the programmed universal transmitter button for as long as the universal transmitter red light flashes (1-2 seconds). Release the button and press the button to confirm the universal transmitter is trained to the receiver.
   5. The garage door opener should recognize the universal transmitter.

Erasing Channels

1. **NOTE:** Individual channels cannot be erased, but can be reprogrammed using the procedures for programming.

   To erase all 3 programmed channels, hold down the 2 outside buttons until the red light begins to flash (20-30 seconds). Release both buttons.

Navigation System

Printable View (62 KB)

The vehicle navigation system audibly and visually guides the user to a selected destination. The system uses a global positioning system (GPS) antenna, a vehicle speed input, and other sensor information to accurately establish the vehicle position. The audio unit provides the visual and audible instructions of the maneuvers required to arrive at the pre-entered destination.

Navigation System

Printable View (203 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C

Principles of Operation

Navigation System

The navigation module is integrated in the audio unit and controls the operation and the interface between the user, the vehicle subsystems, and the external components. The navigation audio unit is on the medium speed controller area network (MS-CAN) and can be diagnosed with a scan tool.

The vehicle navigation system guides the user to a pre-entered destination. A map digital versatile disc (DVD) stored in the navigation audio unit is used for calculating the vehicle course. The audio unit display audibly and visually instructs the user of the maneuvers required to arrive at the destination entered.

A voice recognition system allows the user to interface with the system without using the touch screen. A microphone located in the rear view mirror provides a direct input to the navigation module.

In order to calculate initial vehicle position, the global positioning system (GPS) antenna is used to track several available satellites simultaneously.

The vehicle speed signal (VSS) and transmission gear selected signal are received by the navigation audio unit through the MS-CAN. These signals are used to increase the accuracy of the displayed course.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Audio unit
• Global positioning system (GPS) antenna
• Navigation system digital versatile disc (DVD)
	• Smart junction box (SJB) fuse(s):
	  ▪ 28 (5A) (audio unit hot in START)
	  ▪ 39 (20A) (audio unit hot at all times)
	• Circuitry

3. If the fault is visually evident, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. **NOTE:** Do not press any buttons on the audio unit while the audio unit is carrying out the self-test.

   Carry out the network test:
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the audio unit.

9. If the DTCs retrieved are related to the concern, go to the Audio Unit Diagnostic Trouble Code (DTC) Chart.

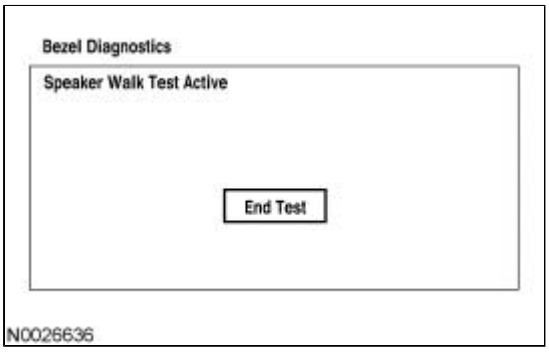
10. If no DTCs related to the concern are retrieved, go to the Navigation Audio Unit Self-Diagnostics.

Navigation Audio Unit Self-Diagnostics

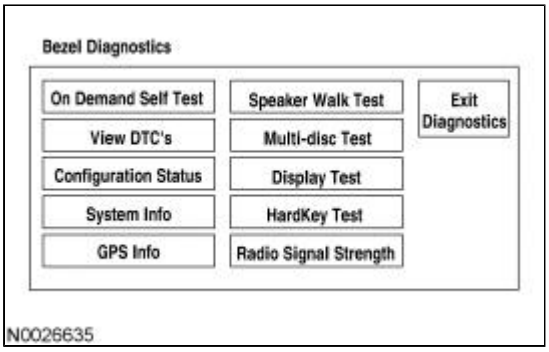
The navigation system provides on-board diagnostics to assist with diagnosing a concern. To carry out self-diagnostics, do the following:

Press and hold presets 3 and 6 simultaneously for 3 seconds.

Press the End Test button on the screen to exit the speaker walk-around test.



The following options are available using the on-screen buttons:



- On Demand Self Test: provides internal self-test diagnostics and displays all the diagnostic trouble codes (DTCs) resulting from the self-test.
- View DTC's: provides a list of all DTCs currently stored in memory.
- Configuration Status: displays the current navigation audio unit configuration.
- System Info: displays the navigation audio unit part number and software information.
- GPS Info: provides satellite and current vehicle information.
- Speaker Walk Test: performs the speaker walk-around test.
- Multi-disc Test: checks the status of the compact disc (CD) player mechanism.
- Display Test: allows checking of the screen colors, and allows checking individual sectors of the touch screen.
- Hardkey Test: provides the status (active/not active) of the audio unit buttons and touch screen.
- Radio Signal Strength: tests the antenna signal.
- Exit Diagnostics: exits diagnostics and returns to the main navigation screen.

Audio Unit Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1117	Audio Steering Wheel Button Stuck	REFER to Section 415-00 to diagnose the steering wheel controls.
B1119	Audio Disc DVD Player Thermal Shutdown	ALLOW the audio unit to cool. DISREGARD the DTC. REPEAT the self-test. CLEAR the DTCs.
B1136	Audio Steering Wheel Switch #2 Circuit Failure	REFER to Section 415-00 to diagnose the steering wheel controls.

B1140	Map Disk Invalid	INSERT a known good navigation map digital versatile disc (DVD). CLEAR the DTCs. REPEAT the self-test. If DTC B1140 is retrieved again, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
B1318	Battery Voltage Low	REPEAT the self-test. CLEAR the DTCs. If DTC B1318 is retrieved again, REFER to Section 414-00 to diagnose the low battery voltage condition.
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
B2103	Antenna Not Connected	REFER to Section 415-00 to diagnose the AM/FM antenna.
B2204	GPS Antenna Connection Open or Short	Go To Pinpoint Test A .
B2274	Phone Transceiver Active Circuit Failure	DTC is not applicable. The vehicle is not equipped with cellular phone functionality. DISREGARD the DTC. REPEAT the self-test. CLEAR the DTCs.
B2384	Audio Reverse Park Aid Mute Ckt Failure	VERIFY the audio unit is configured to receive the vehicle speed signal through the medium speed controller area network (MS-CAN). REFER to Section 418-01 .
B2404	Audio Steering Wheel Switch Circuit Fault	REFER to Section 415-00 to diagnose the steering wheel controls.
B2405	Audio Disc CD Player Thermal Shutdown Fault	ALLOW the unit to cool. DISREGARD the DTC. REPEAT the self-test. CLEAR the DTCs.
B2406	Audio Disc CD Player Internal Fault	REPEAT the self-test. CLEAR the DTCs. If DTC B2406 is retrieved again, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
B2477	Module Configuration Failure	REFER to Section 418-01 to diagnose the module configuration.
B2633	Driver-Front Microphone Circuit Failure	REFER to Section 415-00 to diagnose the voice recognition inoperative.
B2656	DVD (Digital Versatile Disk) Error	REPEAT the self-test. CLEAR the DTCs. If DTC B2656 is retrieved again, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
B2924	Audio Button Stuck	CARRY OUT the hardkey test. VERIFY no audio unit buttons are stuck and that no audio unit button is pressed during the self-test. REPEAT the self-test. CLEAR the DTCs. If DTC B2924 is retrieved again, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
B2965	Audio System Speaker Circuit Fault	REFER to Section 415-00 to diagnose the speakers.
C1992	Vehicle Speed Circuit Failure	VERIFY the audio unit is configured to receive the vehicle speed signal through the MS-CAN. REFER to Section 418-01 .
P0812	Reverse Input Circuit	VERIFY the audio unit is configured to receive the reverse input signal through the MS-CAN. REFER to Section 418-01 .
U0140	Lost Communication	**NOTE:** Diagnose DTC B1318 (if present) before diagnosing this

	With Body Control Module (GEM)	DTC. VERIFY the operation of the illumination system and the accessory delay. ■ If the illumination system or the accessory delay does not operate correctly, REFER to Section 413-00 (illumination) or Section 501-11 (accessory delay) to continue diagnosis. ■ If the illumination system and the accessory delay operate correctly, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	**NOTE:** Diagnose DTC B1318 (if present) before diagnosing this DTC. CARRY OUT the smart junction box (SJB) self-test. ■ If DTC U0155 is present in both the audio unit and the SJB, INSTALL a new instrument cluster. REFER to Section 413-01 . REPEAT the self-test. CLEAR the DTCs. ■ If DTC U0155 is only present in the audio unit, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
U0159	Lost Communication With Parking Assist Control Module (PAM)	DISREGARD the DTC. REPEAT the self-test. CLEAR the DTCs.
U0193	Lost Communication With Digital Audio Control Module (SDARS)	REFER to Section 415-00 .
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	REFER to Section 415-00 .
U0197	Lost Communication With Telephone Control Module	DISREGARD the DTC. REPEAT the self-test. CLEAR the DTCs.
U0238	Lost Communication With Digital Audio Control Module "D" (DSP)	REFER to Section 415-00 .
U0249	Lost Communication With Entertainment Control Module - Rear "B" (RCU)	REFER to Section 415-00 .
U2050	No Application Present	CONFIGURE the audio unit. REFER to Section 418-01 to carry out programmable module installation (PMI). REPEAT the self-test. If DTC U2050 is retrieved again, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
U2051	One or More Calibration Files Missing/Corrupt	CONFIGURE the audio unit. REFER to Section 418-01 to carry out PMI. REPEAT the self-test. If DTC U2051 is retrieved again, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
U2473	Unexpected Vehicle	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED)

	Speed (VSS)	manual to diagnose the vehicle speed sensor (VSS) signal.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the audio unit	• Fuse • Circuitry • Audio unit	• REFER to Section 418-00 .
• Navigation system does not operate correctly — no global positioning system (GPS) antenna signal	• GPS antenna • Audio unit	• Go To Pinpoint Test A .
• Navigation system does not operate correctly — navigation system is inaccurate	• GPS antenna • Audio unit	• Go To Pinpoint Test A .
• Navigation system does not operate correctly — the position cursor is inoperative	• Circuitry • Navigation module • Anti-lock brake system (ABS) module	• CHECK the ABS module for DTCs. ▪ If any ABS module DTCs are present, REFER to Section 206-09 . ▪ If no ABS module DTCs are present, DIAGNOSE any audio unit DTCs. If the symptom is present after all audio unit DTCs have been addressed, REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
• Navigation system does not operate correctly — the voice guidance is inoperative/does not operate correctly	• Circuitry • Audio unit • THX® amplifier	• Go To Pinpoint Test C .
• Navigation system does not operate correctly — the display screen is inoperative	• Audio unit	• VERIFY the operation of the AM/FM audio. ▪ If the AM/FM audio system does not operate correctly, REFER to Section 415-00 to continue diagnosis of the audio unit. ▪ If the AM/FM audio system operates correctly, REMOVE the audio unit

		and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
• Voice recognition is inoperative/does not operate correctly	• Circuitry • Steering wheel controls • Microphone (part of the interior rear view mirror) • Audio unit	• REFER to Section 415-00 to continue diagnosis of the voice recognition system.
• Navigation system does not operate correctly — the audible switch feedback is inoperative	• Audible switch feedback setting • Audio unit	• Go To Pinpoint Test B .

Pinpoint Tests

Pinpoint Test A: Navigation System Does Not Operate Correctly — No Global Positioning System (GPS) Antenna Signal

Normal Operation

The GPS antenna provides information from the GPS satellite system to the GPS receiver in the audio unit. This information is used to calculate vehicle position and direction of travel.

B2204 — sets when an open, short to ground, or short to voltage is detected in the GPS antenna circuit.

Possible Causes

- GPS antenna
- Audio unit

PINPOINT TEST A: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY — NO GLOBAL POSITIONING SYSTEM (GPS) ANTENNA SIGNAL

NOTE: The vehicle must be driven outside of any enclosed structure to an area that is unobstructed by trees, tall buildings, and bridges.

Test Step	Result / Action to Take
A1 CHECK THE OPERATION OF THE NAVIGATION SYSTEM	
• Move the vehicle outside of any enclosed structure to an area that is unobstructed by trees, tall buildings, and bridges. • Operate the audio unit in navigation mode.	**Yes** The system is operating correctly at this time. NOTIFY the customer that obstructions to the line of sight may affect the GPS

 N0026638 • **Does the GPS icon appear, then disappear?**	antenna. **No** GO to A2 .
A2 CHECK THE AUDIO UNIT RECORDED DTCs • Check the recorded DTCs from the audio unit self-test. • **Is DTC B2204 recorded?**	**Yes** GO to A4 . **No** GO to A3 .
A3 CHECK THE GPS ANTENNA MOUNTING • Verify the GPS antenna is installed properly and no aftermarket equipment is obstructing the antenna. • **Is the GPS antenna mounted properly?**	**Yes** GO to A4 . **No** Correctly INSTALL the GPS antenna. REFER to Global Positioning System (GPS) Antenna in this section. TEST the system for normal operation.
A4 SUBSTITUTE THE GPS ANTENNA • Install a known good GPS antenna. • Move the vehicle outside of any enclosed structure to an area that is unobstructed by trees, tall buildings, and bridges. • Operate the audio unit in navigation mode. N0026638 • **Does the GPS icon appear, then disappear?**	**Yes** INSTALL a new GPS antenna. REFER to Global Positioning System (GPS) Antenna in this section. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL the original GPS antenna. GO to A5 .

A5 CHECK THE AUDIO UNIT FOR CORRECT OPERATION
• Disconnect all the audio unit connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the audio unit connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
	
	No
	The system is operating correctly

	at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: Navigation System Does Not Operate Correctly — The Audible Switch Feedback Is Inoperative

Normal Operation

The audible switch feedback settings are controlled by the audio unit. The notification can be set to ALL, TOUCH SCREEN, or NONE, depending on user preference.

Possible Causes

- Audible switch feedback setting
- Audio unit

PINPOINT TEST B: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY — THE AUDIBLE SWITCH FEEDBACK IS INOPERATIVE

Test Step	Result / Action to Take
B1 CHECK THE SWITCH DISPLAY	
• Key in ON position. • Turn the audio unit on. • Press the MENU button. • Select the FEEDBACK tab.  N0026637 • **Is NONE highlighted on the audible feedback settings?**	**Yes** SELECT ALL BUTTONS. TEST the system for normal operation. **No** GO to B2 .
B2 CHECK THE AUDIO UNIT FOR CORRECT OPERATION	

• Disconnect all the audio unit connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the audio unit connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: Navigation System Does Not Operate Correctly — The Voice Guidance Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

For the Audiophile navigation system, the audio unit provides voice-assisted route guidance through the front speakers.

For the THX® navigation system, the audio unit sends voice guidance audio signals to the THX® amplifier through circuits RMN14 (GY/BN) and VMN14 (WH/VT). The voice-assisted route guidance is broadcast through the instrument panel speaker.

For all navigation audio systems, the volume of the voice guidance is controlled by the audio unit.

Possible Causes

- Circuit RMN14 (GY/BN) open, short to ground or voltage
- Circuit VMN14 (WH/VT) open, short to ground or voltage
- THX® amplifier
- Audio unit

PINPOINT TEST C: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY — THE VOICE GUIDANCE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
C1 CHECK THE VOICE GUIDANCE SETTING	
• Operate the audio unit in navigation mode. • Select the FEEDBACK tab.  N0026637 • Select DEFAULT SETTING. • Verify the operation of the voice guidance. • **Does the voice guidance operate correctly?**	**Yes** The system is operating correctly at this time. The concern was caused by a customer-selected setting. **No** GO to C2 .
C2 CHECK THE INSTRUMENT PANEL SPEAKER	
• Carry out the speaker walk-around test. • **Does the instrument panel speaker operate correctly?**	**Yes** GO to C3 . **No** REFER to Section 415-00 to diagnose a single speaker inoperative.

C3 CHECK THE NAVIGATION AUDIO SIGNAL TO THE THX® AMPLIFIER	
• Key in OFF position. • Disconnect: THX® Amplifier C2364c. • Operate the audio unit in navigation mode. • While pressing the REPEAT button on the audio unit, measure the AC voltage between the THX® amplifier C2364c-15, circuit VMN14 (WH/VT), harness side and the THX® amplifier C2364c-16, circuit RMN14 (GY/BN), harness side.  N0057244 • **Is a fluctuating AC voltage present?**	**Yes** GO to C7 . **No** GO to C4 .
C4 CHECK CIRCUITS RMN14 (GY/BN) AND VMN14 (WH/VT) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Audio Unit C240c. • Key in ON position. • Measure the voltage between the audio unit C240c-1, circuit VMN14 (WH/VT), harness side and ground; and between the audio unit C240c-2, circuit RMN14 (GY/BN), harness side and ground.  N0058905 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to C5 .
C5 CHECK CIRCUITS RMN14 (GY/BN) AND VMN14 (WH/VT) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the audio unit, harness side and the THX® amplifier, harness side; and between the audio unit, harness side and ground as follows: **Audio Unit Connector-Pin** / **THX® Amplifier Connector-Pin** / **Circuit** C240c-1 / C2364c-15 / VMN14 (WH/VT) C240c-2 / C2364c-16 / RMN14 (GY/BN) • **Is the resistance less than 5 ohms between the audio unit**	**Yes** GO to C6 . **No** REPAIR the circuit in question. TEST the system for normal operation.

and the THX® amplifier, and greater than 10,000 ohms between the audio unit and ground?	
C6 CHECK FOR CORRECT AUDIO UNIT OPERATION	

• Disconnect all the audio unit connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the audio unit connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Section 415-01 . TEST the system for normal operation after the repair.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

C7 CHECK FOR CORRECT THX® AMPLIFIER OPERATION	

• Disconnect all the THX® amplifier connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the THX® amplifier connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new THX® amplifier. REFER to Section 415-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Navigation System Calibration

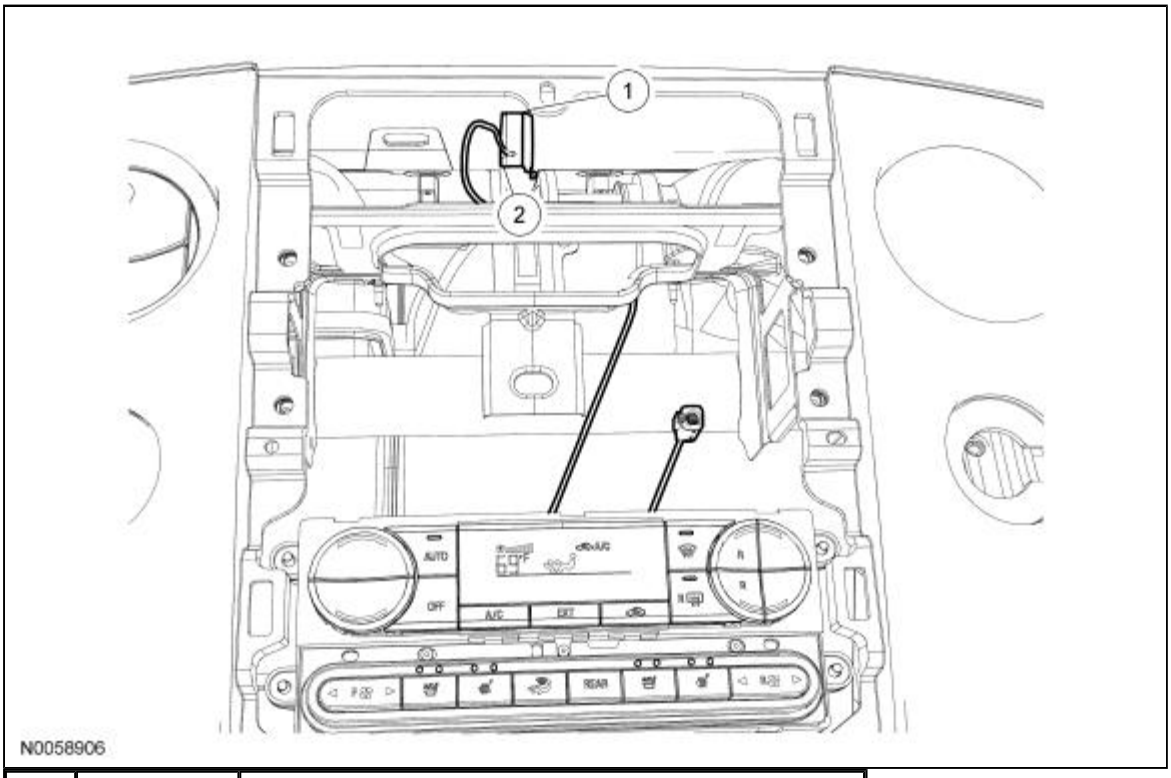
Printable View (62 KB)

1. Access the current set of regional map digital versatile discs (DVDs).
2. Start the vehicle.
3. Turn on the audio unit.
4. Insert the appropriate regional map DVD into the DVD slot in the audio unit.
5. Press the NAV button.
6. Press ACCEPT after reading the disclaimer.
7. Press the MAP button.
8. Road test the vehicle until the red compass heading indicator turns green/white.
9. Leave the map DVD in the audio unit.

Global Positioning System (GPS) Antenna

Printable View (190 KB)

NOTE: Expedition shown, Navigator similar.



Item	Part Number	Description
1	—	Global positioning system (GPS) antenna clip (part of 10E893)
2	10E893	GPS antenna

Removal and Installation

1. Remove the audio unit. For additional information, refer to Section 415-01 .
2. Unclip the GPS antenna from the instrument panel brace and remove the GPS antenna.
3. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
Smart junction box (SJB) bolts	2	18

Module Controlled Functions

Printable View (63 KB)

The 2 multifunction electronic modules on this vehicle are:

- Driver seat module (DSM)
- Smart junction box (SJB)

Driver Seat Module (DSM)

The DSM permits 2 automatic memory settings that can be recalled using the memory switches or the remote keyless entry (RKE) transmitter for the following systems:

- Adjustable brake pedal
- Driver seat
- Exterior mirrors

Smart Junction Box (SJB)

The SJB controls the following functions:

- Autolamps
- Battery saver
- Exterior lighting
- Interior lighting
- Perimeter anti-theft
- Power windows global open/close
- Power locks
- Remote keyless entry (RKE)
- Third row power-fold seat
- Tire pressure monitoring system (TPMS)
- Warning chimes and warning lamps

B1202	Fuel Sender Circuit Open	Instrument Cluster	REFER to Section 413-01 .
B1204	Fuel Sender Circuit Short to Ground	Instrument Cluster	REFER to Section 413-01 .
B1213	Anti-Theft Number of Programmed Keys Is Below Minimum	Instrument Cluster	REFER to Section 419-01 .
B1231	Event Threshold Exceeded	Restraints Control Module (RCM)	REFER to Section 501-20B .
B1251	Air Temperature Internal Sensor Circuit Open	EATC Module	REFER to Section 412-00 .
B1253	Air Temperature Internal Sensor Circuit Short to Ground	EATC Module	REFER to Section 412-00 .
B1255	Air Temperature External Sensor Circuit Open	EATC Module	REFER to Section 412-00 .
B1255	Air Temperature External Sensor Circuit Open	Instrument Cluster	REFER to Section 413-08 .
B1257	Air Temperature External Sensor Circuit Short to Ground	EATC Module	REFER to Section 412-00 .
B1257	Air Temperature External Sensor Circuit Short to Ground	Instrument Cluster	REFER to Section 413-08 .
B1302	Accessory Delay Relay Coil Circuit Failure	SJB	REFER to Section 501-11 .
B1304	Accessory Delay Relay Coil Circuit Short To Battery	SJB	REFER to Section 501-11 .
B1317	Battery Voltage High	Four Wheel Drive (4WD) Control Module	REFER to Section 414-00 .
B1317	Battery Voltage High	Air Suspension Module	REFER to Section 414-00 .
B1317	Battery Voltage High	DVD Player	REFER to Section 414-00 .
B1317	Battery Voltage High	Instrument Cluster	REFER to Section 414-00 .
B1317	Battery Voltage High	Parking Aid Module	REFER to Section 414-00 .

B1317	Battery Voltage High	Power Liftgate Module	REFER to Section 414-00 .
B1317	Battery Voltage High	Power Running Board Module	REFER to Section 414-00 .
B1317	Battery Voltage High	RCM	REFER to Section 414-00 .
B1317	Battery Voltage High	SJB	REFER to Section 414-00 .
B1317	Battery Voltage High	THX® Amplifier	REFER to Section 414-00 .
B1318	Battery Voltage Low	4WD Control Module	REFER to Section 414-00 .
B1318	Battery Voltage Low	Air Suspension Module	REFER to Section 414-00 .
B1318	Battery Voltage Low	Audio Unit	REFER to Section 414-00 .
B1318	Battery Voltage Low	Auxiliary Audio Module	REFER to Section 414-00 .
B1318	Battery Voltage Low	DVD Player	REFER to Section 414-00 .
B1318	Battery Voltage Low	Instrument Cluster	REFER to Section 414-00 .
B1318	Battery Voltage Low	Parking Aid Module	REFER to Section 413-13 .
B1318	Battery Voltage Low	Power Liftgate Module	REFER to Section 414-00 .
B1318	Battery Voltage Low	Power Running Board Module	REFER to Section 414-00 .
B1318	Battery Voltage Low	RCM	REFER to Section 414-00 .
B1318	Battery Voltage Low	Satellite Radio Receiver	REFER to Section 414-00 .
B1318	Battery Voltage Low	SJB	REFER to Section 414-00 .
B1318	Battery Voltage Low	THX® Amplifier	REFER to Section 414-00 .
B1320	Driver Door Ajar Circuit Open	SJB	REFER to Section 417-02 .
B1328	Passenger Door Ajar Circuit Open	SJB	REFER to Section 417-02 .
B1331	Decklid Ajar Rear Door Circuit Failure	SJB	REFER to Section 417-02 .
B1336	Door Ajar RR Circuit Open	SJB	REFER to Section 417-02 .
B1342	ECU Is Faulted	4WD Control Module	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new 4WD control module. REFER to Section 308-07A . REPEAT the self-test.
B1342	ECU Is Faulted	Air Suspension Module	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new air suspension module. REFER to Section 204-05 . REPEAT the self-test.
B1342	ECU Is Faulted	Anti-Lock Brake System (ABS) Module	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new ABS/TC module. REFER to Section 206-09 . REPEAT the self-test.
B1342	ECU Is Faulted	Audio Unit	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new audio unit. REFER to Section 415-01 .

			REPEAT the self-test.
B1342	ECU Is Faulted	Auxiliary Audio Module	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new auxiliary audio module. REFER to Section 415-01 . REPEAT the self-test.
B1342	ECU Is Faulted	Climate Controlled Seat Module	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new climate controlled seat module. REFER to Section 501-10 . REPEAT the self-test.
B1342	ECU Is Faulted	DSM	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new DSM. REFER to Driver Seat Module (DSM) in this section. REPEAT the self-test.
B1342	ECU Is Faulted	DVD Player	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new DVD player. REFER to Section 415-07 . REPEAT the self-test.
B1342	ECU Is Faulted	EATC Module	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new EATC module. REFER to Section 412-00 . REPEAT the self-test.
B1342	ECU Is Faulted	Instrument Cluster	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new instrument cluster. REFER to Section 413-01 . REPEAT the self-test.
B1342	ECU Is Faulted	Parking Aid Module	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new parking aid module. REFER to Section 413-13 . REPEAT the self-test.
B1342	ECU Is Faulted	Power Liftgate Module	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new power liftgate module. REFER to Section 501-03 . REPEAT the self-test.
B1342	ECU Is Faulted	Power Running Board Module	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new power running board module. REFER to Section 501-08 . REPEAT the self-test.
B1342	ECU Is Faulted	RCM	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new RCM. REFER to Section 501-20B . REPEAT the self-test.
B1342	ECU Is Faulted	Satellite Radio Receiver	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new satellite radio receiver. REFER to Section 415-01 . REPEAT the self-test.
B1342	ECU Is Faulted	SJB	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new SJB. REFER to Smart Junction Box (SJB) in this section. REPEAT the self-test.
B1342	ECU Is Faulted	THX® Amplifier	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new THX® amplifier. REFER to Section 415-01 . REPEAT the self-test.
B1352	Ignition Key-In Circuit Failure	SJB	REFER to Section 413-09 .

B1472	Lamp Headlamp Input Circuit Short To Ground	SJB	REFER to Section 417-01 .
B1483	Brake Pedal Input Circuit Failure	ABS Module	REFER to Section 206-09 .
B1485	Brake Pedal Input Short to Battery	SJB	REFER to Section 206-09 .
B1510	Flash To Pass Switch Circuit Short To Ground	SJB	REFER to Section 417-01 .
B1520	Hood Switch Circuit Open	SJB	DISREGARD the DTC. The vehicle is not equipped with a hood switch. CLEAR the DTCs. REPEAT the self-test. If the DTC B1520 is retrieved again, the SJB may be incorrectly configured. CARRY OUT the programmable module installation (PMI) procedure. REFER to Section 418-01 .
B1530	Memory Set Switch Circuit Short to Ground	DSM	REFER to Section 501-10 .
B1534	Memory 1 Switch Circuit Short to Ground	DSM	REFER to Section 501-10 .
B1538	Memory 2 Switch Circuit Short to Ground	DSM	REFER to Section 501-10 .
B1555	Ignition Run/Start Circuit Failure	4WD Control Module	REFER to Section 308-07A .
B1566	Door Ajar Circuit Short To Ground	Air Suspension Module	REFER to Section 417-02 .
B1572	Door Ajar LR Circuit Open	SJB	REFER to Section 417-02 .
B1578	Lamp Park Input Circuit Short To Ground	SJB	REFER to Section 417-01 .
B1600	PATS Ignition Key Transponder Signal Is Not Received	Instrument Cluster	REFER to Section 419-01 .
B1601	PATS Received Incorrect Key-Code From Ignition Key Transponder	Instrument Cluster	REFER to Section 419-01 .
B1602	PATS Received Invalid Format Of Key-Code From Ignition Key Transponder	Instrument Cluster	REFER to Section 419-01 .
B1624	Lamp Keypad Output Open Circuit	SJB	REFER to Section 501-14 .
B1632	Mirror Driver Left Circuit Open	DSM	REFER to Section 501-09 .
B1633	Mirror Driver Left Circuit Short To Battery	DSM	REFER to Section 501-09 .
B1634	Mirror Driver Left Circuit Short To Ground	DSM	REFER to Section 501-09 .
B1636	Mirror Driver Right Circuit Open	DSM	REFER to Section 501-09 .
B1637	Mirror Driver Right Circuit Short To Battery	DSM	REFER to Section 501-09 .
B1638	Mirror Driver Right Short To Ground	DSM	REFER to Section 501-09 .
B1640	Mirror Passenger Left	DSM	REFER to Section 501-09 .

	Circuit Open		
B1641	Mirror Passenger Left Circuit Short To Battery	DSM	REFER to Section 501-09 .
B1642	Mirror Passenger Left Circuit Short To Ground	DSM	REFER to Section 501-09 .
B1644	Mirror Passenger Right Circuit Open	DSM	REFER to Section 501-09 .
B1645	Mirror Passenger Right Circuit Short To Battery	DSM	REFER to Section 501-09 .
B1646	Mirror Passenger Right Circuit Short To Ground	DSM	REFER to Section 501-09 .
B1663	Seat Driver Front Up/Down Motor Stalled	DSM	REFER to Section 501-10 .
B1664	Seat Driver Rear Up/Down Motor Stalled	DSM	REFER to Section 501-10 .
B1665	Seat Driver Forward/Backward Motor Stalled	DSM	REFER to Section 501-10 .
B1666	Seat Recline Forward/Rearward Motor Stalled	DSM	REFER to Section 501-10 .
B1667	Mirror Driver Up/Down Motor Stalled	DSM	REFER to Section 501-09 .
B1668	Mirror Driver Right/Left Motor Stalled	DSM	REFER to Section 501-09 .
B1669	Mirror Passenger Up/Down Motor Stalled	DSM	REFER to Section 501-09 .
B1670	Mirror Passenger Right/Left Motor Stalled	DSM	REFER to Section 501-09 .
B1676	Battery Pack Voltage Out of Range	ABS Module	REFER to Section 206-09 .
B1676	Battery Voltage Out of Range	DSM	REFER to Section 414-00 .
B1676	Battery Voltage Out of Range	EATC Module	REFER to Section 414-00 .
B1681	PATS Transceiver Module Signal Is Not Received	Instrument Cluster	REFER to Section 419-01 .
B1685	Lamp Dome Input Circuit Failure	SJB	REFER to Section 417-02 .
B1688	Lamp Dome Input Circuit Short To Ground	SJB	REFER to Section 417-02 .
B1696	Autolamp On Circuit Short To Ground	SJB	REFER to Section 417-01 .
B1703	Seat Driver Recline Forward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1707	Seat Driver Recline Rearward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1711	Seat Driver Front Up Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .

B1715	Seat Driver Front Down Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1719	Seat Driver Forward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1723	Seat Driver Rearward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1727	Seat Driver Rear Up Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1731	Seat Driver Rear Down Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1735	Mirror Driver Vertical Switch Circuit Short to Battery	DSM	REFER to Section 501-09 .
B1739	Mirror Driver Horizontal Switch Circuit Short to Battery	DSM	REFER to Section 501-09 .
B1743	Mirror Passenger Vertical Switch Circuit Short to Battery	DSM	REFER to Section 501-09 .
B1747	Mirror Passenger Horizontal Switch Circuit Short to Battery	DSM	REFER to Section 501-09 .
B1774	Mirror Driver Up Circuit Open	DSM	REFER to Section 501-09 .
B1775	Mirror Driver Up Circuit Short To Battery	DSM	REFER to Section 501-09 .
B1776	Mirror Driver Up Circuit Short To Ground	DSM	REFER to Section 501-09 .
B1779	Mirror Driver Down Circuit Open	DSM	REFER to Section 501-09 .
B1780	Mirror Driver Down Circuit Short To Battery	DSM	REFER to Section 501-09 .
B1781	Mirror Driver Down Short To Ground	DSM	REFER to Section 501-09 .
B1783	Mirror Passenger Up Circuit Open	DSM	REFER to Section 501-09 .
B1784	Mirror Passenger Up Circuit Short To Battery	DSM	REFER to Section 501-09 .
B1785	Mirror Passenger Up Circuit Short To Ground	DSM	REFER to Section 501-09 .
B1787	Mirror Passenger Down Circuit Open	DSM	REFER to Section 501-09 .
B1788	Mirror Passenger Down Circuit Short To Battery	DSM	REFER to Section 501-09 .
B1789	Mirror Passenger Down Circuit Short To Ground	DSM	REFER to Section 501-09 .
B1791	Autolamp Sensor Input Circuit Open	SJB	REFER to Section 417-01 .
B1793	Autolamp Sensor Input Circuit Short to Ground	SJB	REFER to Section 417-01 .

B1868	Lamp Air Bag Warning Indicator Circuit Failure	Instrument Cluster	REFER to Section 413-01 .
B1915	Air Bag Driver Circuit Failure	Instrument Cluster	REFER to Section 413-01 .
B1946	Climate Control A/C Post Evaporator Sensor Circuit Failure	EATC Module	REFER to Section 412-00 .
B1947	Climate Control A/C Post Evaporator Sensor Circuit Short To Ground	EATC Module	REFER to Section 412-00 .
B1952	Seat Rear Up/Down Feedback Potentiometer Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1953	Seat Rear Up/Down Position Feedback Circuit Short To Ground	DSM	REFER to Section 501-10 .
B1956	Seat Front Up/Down Feedback Potentiometer Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1957	Seat Front Up/Down Position Feedback Circuit Short To Ground	DSM	REFER to Section 501-10 .
B1960	Seat Recline Forward/Backward Position Feedback Circuit Short To Battery	DSM	REFER to Section 501-10 .
B1961	Seat Recline Forward/Rearward Feedback Potentiometer Circuit Failure	DSM	REFER to Section 501-10 .
B1964	Seat Horizontal Forward/Rearward Feedback Potentiometer Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1965	Seat Horizontal Forward/Rearward Position Feedback Circuit Short To Ground	DSM	REFER to Section 501-10 .
B1987	Pedal Forward/Rearward Motor Stalled	DSM	REFER to Section 206-00 .
B1988	Pedal Position Forward Switch Circuit Short to Ground	DSM	REFER to Section 206-00 .
B1989	Pedal Position Rearward Switch Circuit Short to Ground	DSM	REFER to Section 206-00 .
B1990	Pedal Forward/Rearward Feedback Potentiometer Circuit Failure	DSM	REFER to Section 206-00 .
B1991	Pedal Forward/Rearward Feedback Potentiometer Circuit Short to Battery	DSM	REFER to Section 206-00 .
B19A1	Passenger Seat Cushion Blower Speed Short to	Climate Controlled Seat	REFER to Section 501-10 .

	Battery	Module	
B19A2	Passenger Seat Back Blower Speed Short to Battery	Climate Controlled Seat Module	REFER to Section 501-10 .
B19A3	Driver Seat Cushion Blower Speed Short to Battery	Climate Controlled Seat Module	REFER to Section 501-10 .
B19A4	Driver Seat Back Blower Speed Short to Battery	Climate Controlled Seat Module	REFER to Section 501-10 .
B19A5	Passenger Seat Cushion Blower Speed Short to Ground	Climate Controlled Seat Module	REFER to Section 501-10 .
B19A6	Passenger Seat Back Blower Speed Short to Ground	Climate Controlled Seat Module	REFER to Section 501-10 .
B19A7	Driver Seat Cushion Blower Speed Short to Ground	Climate Controlled Seat Module	REFER to Section 501-10 .
B19A8	Driver Seat Back Blower Speed Short to Ground	Climate Controlled Seat Module	REFER to Section 501-10 .
B2008	Wipers On Signal Circuit Short to Ground	SJB	DISREGARD the DTC. The vehicle is not equipped with a wipers on signal circuit. CLEAR the DTCs. REPEAT the self-test. If the DTC B2008 is retrieved again, the SJB may be incorrectly configured. CARRY OUT the PMI procedure. REFER to Section 418-01 .
B2019	Liftgate Exceeded Time Allowed to Cinch Door	Power Liftgate Module	REFER to Section 501-03 .
B201A	Power System Disabled Due to High Manual Closing Speed	Power Liftgate Module	REFER to Section 501-03 .
B2031	Left Corner Lamp Output Circuit Failure	SJB	DISREGARD the DTC. The vehicle is not equipped with a left corner lamp output circuit on the SJB C2280B-17. CLEAR the DTCs. REPEAT the self-test. If the DTC B2031 is retrieved again, the SJB may be incorrectly configured. CARRY OUT the PMI procedure. REFER to Section 418-01 .
B2032	Right Corner Lamp Output Circuit Failure	SJB	DISREGARD the DTC. The vehicle is not equipped with a right corner lamp output circuit on the SJB C2280B-19. CLEAR the DTCs. REPEAT the self-test. If the DTC B2032 is retrieved again, the SJB may be incorrectly configured. CARRY OUT the PMI procedure. REFER to Section 418-01 .
B2044	Left Rear Stop Lamp Circuit Short to Ground	SJB	REFER to Section 417-01 .
B2045	Left Rear Stop Lamp Circuit Open	SJB	REFER to Section 417-01 .
B2046	Right Rear Stop Lamp Circuit Short to Ground	SJB	REFER to Section 417-01 .
B2047	Right Rear Stop Lamp	SJB	REFER to Section 417-01 .

	Circuit Open		
B2048	Left Rear Turn Lamp Circuit Short to Ground	SJB	REFER to Smart Junction Box (SJB) in this section.
B2049	Left Rear Turn Lamp Circuit Open	SJB	DISREGARD the DTC. The vehicle is not equipped with a left rear turn lamp circuit on the SJB C2280E-21. CLEAR the DTCs. REPEAT the self-test. If the DTC B2049 is retrieved again, the SJB may be incorrectly configured. CARRY OUT the PMI procedure. REFER to Section 418-01 .
B2050	Right Rear Turn Lamp Circuit Short to Ground	SJB	REFER to Smart Junction Box (SJB) in this section.
B2051	Right Rear Turn Lamp Circuit Open	SJB	DISREGARD the DTC. The vehicle is not equipped with a right rear turn lamp circuit on the SJB C2280E-19. CLEAR the DTCs. REPEAT the self-test. If the DTC B2051 is retrieved again, the SJB may be incorrectly configured. CARRY OUT the PMI procedure. REFER to Section 418-01 .
B2071	Hazard Switch Signal Short to Ground	SJB	REFER to Section 417-01 .
B2077	Liftgate Ajar Sw Circuit Failure	SJB	REFER to Section 417-02 .
B2084	Memory Set Indicator Short to Ground	DSM	REFER to Section 501-10 .
B208A	Memory Set Indicator Short to Ground	DSM	REFER to Section 501-10 .
B2097	Compass Module Failure	Instrument Cluster	REFER to Section 413-08 .
B2A37	Floor Lamp Output Circuit Open	SJB	DISREGARD the DTC. The vehicle is not equipped with a floor lamp output circuit on the SJB C2280G-2. CLEAR the DTCs. REPEAT the self-test. If the DTC B2A37 is retrieved again, the SJB may be incorrectly configured. CARRY OUT the PMI procedure. REFER to Section 418-01 .
B2100	Door Driver Key Cylinder Switch Failure	SJB	DISREGARD the DTC. The vehicle is not equipped with a driver door key cylinder switch on the SJB C2280E-8, 9. CLEAR the DTCs. REPEAT the self-test. If the DTC B2100 is retrieved again, the SJB may be incorrectly configured. CARRY OUT the PMI procedure. REFER to Section 418-01 .
B2103	Antenna Not Connected	Audio Unit	REFER to Section 415-00 .
B2103	Antenna Not Connected	Instrument Cluster	REFER to Section 419-01 .
B2108	Trunk Key Cylinder Switch Failure	SJB	DISREGARD the DTC. The vehicle is not equipped with a trunk key cylinder switch. CLEAR the DTCs. REPEAT the self-test. If the DTC B2108 is retrieved again, the SJB may be incorrectly configured. CARRY OUT the PMI procedure. REFER to Section 418-01 .
B2139	Data Mismatch (Receive Data Does Not Match What	Power Running Board Module	REFER to Section 501-08 .

	Was Expected)		
B2141	NVM Configuration Failure	Instrument Cluster	REFER to Section 419-01 .
B2143	NVM Memory Failure	Instrument Cluster	CLEAR the DTCs. REPEAT the self-test. If DTC B2143 is retrieved again, INSTALL a new instrument cluster. REFER to Section 413-01 . REPEAT the self-test.
B2204	GPS Antenna Connection Open or Short	Audio Unit	REFER to Section 419-07 .
B2212	Panel Dim Switch Out of Range	SJB	REFER to Section 417-02 .
B2254	Front Fog Lamp Switch Failure	SJB	REFER to Section 417-01 .
B2266	Driver Blend Door/Lower Actuator Circuit Failure	EATC Module	REFER to Section 412-00 .
B2267	Passenger Blend Door/Lower Actuator Circuit Failure	EATC Module	REFER to Section 412-00 .
B2268	Steering Wheel Climate Control Circuit Open	EATC Module	REFER to Section 412-00 .
B2269	Steering Wheel Climate Control Circuit Short to Ground	EATC Module	REFER to Section 412-00 .
B2274	Phone Transceiver Active Circuit Failure	Audio Unit	DISREGARD the DTC. CLEAR the DTCs. REPEAT the self-test.
B2276	Less Than Two Transmitters Programmed	SJB	REFER to Section 501-14 .
B2281	Right Turn Switch Short to Ground	SJB	REFER to Section 417-01 .
B2282	Left Turn Switch Short to Ground	SJB	REFER to Section 417-01 .
B2292	Restraint System - Seatbelt Pretensioner Fault	RCM	REFER to Section 501-20B .
B2293	Restraint System - Airbag Fault	RCM	REFER to Section 501-20B .
B2294	Restraint System - Curtain Fault	RCM	REFER to Section 501-20B .
B2295	Restraint System - Side Airbag Fault	RCM	REFER to Section 501-20B .
B2296	Restraint System - Impact Sensor Fault	RCM	REFER to Section 501-20B .
B2300	Seat Driver Memory Position Error	DSM	REFER to Section 501-10 .
B2312	Mirror Passenger Horizontal Feedback Potentiometer Circuit Failure	DSM	REFER to Section 501-09 .
B2314	Mirror Passenger Horizontal Feedback Potentiometer Circuit Short to Battery	DSM	REFER to Section 501-09 .
B2316	Mirror Passenger Vertical Feedback Potentiometer Circuit Failure	DSM	REFER to Section 501-09 .

B2318	Mirror Passenger Vertical Feedback Potentiometer Circuit Short to Battery	DSM	REFER to Section 501-09 .
B2320	Mirror Driver Horizontal Feedback Potentiometer Circuit Failure	DSM	REFER to Section 501-09 .
B2322	Mirror Driver Horizontal Feedback Potentiometer Circuit Short to Battery	DSM	REFER to Section 501-09 .
B2324	Mirror Driver Vertical Feedback Potentiometer Circuit Failure	DSM	REFER to Section 501-09 .
B2326	Mirror Driver Vertical Feedback Potentiometer Circuit Short to Battery	DSM	REFER to Section 501-09 .
B2334	Column Tilt Feedback Potentiometer Circuit Short to Battery	DSM	REFER to Section 211-00 .
B2335	Column Tilt Feedback Potentiometer Circuit Short to Ground	DSM	REFER to Section 211-00 .
B2341	Column Tilt Motor Stalled	DSM	REFER to Section 211-00 .
B236A	Chime Output Circuit Open	Power Liftgate Module	REFER to Section 501-03 .
B2384	Audio Reverse Aid Mute Input Ckt. Failure	Audio Unit	REFER to Section 415-00 .
B2401	Audio Tape Deck Mechanism Fault	Audio Unit	REFER to Section 415-00 .
B2404	Audio Steering Wheel Switch Circuit Fault	Audio Unit	REFER to Section 415-00 .
B2405	Audio Disc CD Player Thermal Shutdown Fault	Audio Unit	REFER to Section 415-00 .
B2406	Audio Disc CD Player Internal Fault	Audio Unit	REFER to Section 415-00 .
B2411	Humidity Sensor Open	EATC Module	REFER to Section 412-00 .
B2412	Humidity Sensor Short	EATC Module	REFER to Section 412-00 .
B2418	Sensor Power Short to Ground	Power Liftgate Module	REFER to Section 501-03 .
B2419	Sensor 1 Invalid	Power Liftgate Module	REFER to Section 501-03 .
B2420	Sensor 2 Invalid	Power Liftgate Module	REFER to Section 501-03 .
B2425	Remote Keyless Entry Out of Synchronization	SJB	REFER to Section 501-14 .
B2426	Passenger Solar Radiation Sensor Circuit Open	EATC Module	REFER to Section 412-00 .
B2427	Passenger Solar Radiation Sensor Circuit Short to Ground	EATC Module	REFER to Section 412-00 .
B2431	Transponder Programming Failed	Instrument Cluster	REFER to Section 419-01 .

B2434	Drivers Seat Belt Buckle Switch Circuit Short to Ground	RCM	REFER to Section 501-20B .
B2435	Drivers Seat Belt Buckle Switch Resistance Out of Range	RCM	REFER to Section 501-20B .
B2438	Passengers Seat Belt Buckle Switch Circuit Short to Ground	RCM	REFER to Section 501-20B .
B2439	Passengers Seat Belt Buckle Switch Resistance Out of Range	RCM	REFER to Section 501-20B .
B2477	Module Configuration Failure	ABS Module	REFER to Section 418-01 .
B2477	Module Configuration Failure	Air Suspension Module	REFER to Section 418-01 .
B2477	Module Configuration Failure	Audio Unit	REFER to Section 418-01 .
B2477	Module Configuration Failure	Auxiliary Audio Module	REFER to Section 418-01 .
B2477	Module Configuration Failure	Climate Controlled Seat Module	REFER to Section 418-01 .
B2477	Module Configuration Failure	DSM	REFER to Section 418-01 .

Smart Junction Box (SJB)

Printable View (116 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

The smart junction box (SJB) communicates via the medium speed controller area network (MS-CAN).

The SJB controls the power door lock system. The module monitors the door lock/unlock switch inputs from the interior door lock switches. When the module receives an unlock/lock command from any door lock control switch, the module activates the door lock actuators. For additional information, refer to Section 501-14 .

The module also controls the following remote lock/unlock features:

- Remote keyless entry (RKE) transmitter lock/unlock
- Panic alarm
- Keyless entry keypad

The SJB controls the autolamp subsystem. The autolamp subsystem provides light-sensitive automatic on/off control of the headlamps and parking lamps. For additional information, refer to Section 417-01 .

The third row power-fold seat relays are also controlled by the SJB. This allows the seats to be adjusted by pressing one of the third row power-fold seat switches. For additional information, refer to Section 501-10 .

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Battery junction box (BJB) fuse 69 (30A)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.

9. If the DTCs retrieved are related to the concern, go to the Diagnostic Trouble Code Chart in this section.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Index

DTC	Description	Action
B106E	Solid State Driver Disabled Due to Short Circuit	Go To Pinpoint Test A .
B106F	Module Disabled Due to External Fault	Go To Pinpoint Test A .
B2048	Left Rear Turn Lamp Circuit Short to Ground	Go To Pinpoint Test B .

B2050	Right Rear Turn Lamp Circuit Short to Ground	Go To Pinpoint Test B .
B2477	Module Configuration Failure	REFER to Section 418-01 .
B2949	Global Opening/Closing Circuit Short to Battery	Go To Pinpoint Test B .
B2A2B	Left Corner Lamp Output Circuit Short to Ground	Go To Pinpoint Test B .
B2A2C	Right Corner Lamp Output Circuit Short to Ground	Go To Pinpoint Test B .
B2A38	Floor Lamp Output Circuit Short to Ground	Go To Pinpoint Test B .
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	**NOTE:** Diagnose SJB or instrument cluster DTC B1318 (if present) before diagnosing this DTC. CARRY OUT the audio unit self-test using the scan tool. ● If DTC U0155 is present in both the audio unit and the SJB, INSTALL a new instrument cluster. REFER to Section 413-01 . CLEAR the DTCs. REPEAT the self-test. ● If DTC U0155 is not present in the audio unit, INSTALL a new SJB. REFER to Smart Junction Box (SJB) in this section. REPEAT the self-test.
U2050	No Application Present	CONFIGURE the SJB. REFER to Section 418-01 . CLEAR the DTCs. REPEAT the self-test. If DTC U2050 is retrieved again, INSTALL a new SJB. REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation.
All other DTCs	—	REFER to Diagnostic Trouble Code Chart in this section.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
● No communication with the smart junction box (SJB)	● Fuse(s) ● Circuitry ● SJB	● REFER to Section 418-00 .

Pinpoint Tests

Pinpoint Test A: DTC B106E — Solid State Driver Disabled Due To Short Circuit

Normal Operation

The smart junction box (SJB) controls the output of several vehicle systems. When a repetitive fault causing a circuit overload is detected on any of the output circuits, the SJB disables the circuit by removing voltage, or ground, to the affected circuit. The circuit remains disabled until the fault is

corrected and an on-demand self-test is run. After the on-demand self-test has been run, any DTCs related to the fault will be cleared.

DTC B106E — sets when the SJB has disabled a circuit due to a repetitive fault causing a circuit overload. A corresponding DTC for the circuit in question will also set.

DTC B106F — sets when one or more output functions are permanently disabled due to a repetitive circuit overload fault. DTC B106F will be set with DTC B106E. When DTC B106F is present, a new SJB must be installed after the fault condition has been corrected.

Possible Causes

- Output circuit short to ground or voltage
- SJB

PINPOINT TEST A: DTC B106E — SOLID STATE DRIVER DISABLED DUE TO SHORT CIRCUIT

CAUTION: If DTC B106F is present and a new SJB is to be installed, the fault condition must be corrected first. Failure to correct the fault condition first may cause damage to the new SJB, resulting in a repeat repair.

Test Step	Result / Action to Take
A1 REVIEW THE DTCs	
• Review the DTCs from the SJB self-test. • **Are only DTCs B106E and B106F present?**	**Yes** INSTALL a new SJB. REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation. **No** CORRECT any DTCs present other than DTCs B106E and B106F. REFER to Diagnostic Trouble Code Chart in this section. After the repair, GO to A2 .
A2 CARRY OUT THE SJB SELF-TEST	
• Carry out the SJB self-test. • **Is DTC B106F present?**	**Yes** INSTALL a new SJB. REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern was caused by a fault in one of the output circuits.

Pinpoint Test B: DTCs B2048, B2050, B2949, B2A2B, B2A2C, B2A38 — Possible Smart Junction Box (SJB) Internal Errors

Normal Operation

If the SJB is not configured correctly, these DTCs may appear in error. The SJB will need to be configured correctly, possibly using the As-Built data, in order to correct this issue and clear the DTCs. If not, then the following pinpoint test will need to be carried out to determine if the SJB is at fault.

DTC B2048 — sets when the LR turn lamp circuit (on SJB C2280D-21) is shorted to ground.

DTC B2050 — sets when the RR turn lamp circuit (on SJB C2280D-19) is shorted to ground.

DTC B2949 — sets when the global opening/closing circuit (on SJB C2280D-10) is shorted to battery.

DTC B2A2B — sets when the left corner lamp output circuit (on SJB C2280B-17) is shorted to ground.

DTC B2A2C — sets when the right corner lamp output circuit (on SJB C2280B-19) is shorted to ground.

DTC B2A38 — sets when the floor lamp output circuit (on SJB C2280G-2) is shorted to ground.

NOTE: The pins mentioned above are not populated.

Possible Causes

- SJB

PINPOINT TEST B: DTCs B2048, B2050, B2949, B2A2B, B2A2C, B2A38 — POSSIBLE SMART JUNCTION BOX (SJB) INTERNAL ERRORS

Test Step	Result / Action to Take

B1 CHECK FOR CORRECT SJB OPERATION
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Enter the following diagnostic mode on the diagnostic tool: Clear the DTCs.
• Enter the following diagnostic mode on the diagnostic tool: Repeat the Self-Test.
• **Is DTC B2048, B2050, B2949, B2A2B, B2A2C, or B2A38 retrieved (or any combination of the previously mentioned DTCs)?**
	Yes
	INSTALL a new SJB. REFER to Smart Junction Box (SJB) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Driver Seat Module (DSM)

Printable View (105 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

The driver seat module (DSM) is on the controller area network (CAN) communication network.

The DSM controls the memory power exterior mirrors. This feature allows the driver to program personalized mirror positions. Once the driver has stored a mirror position, the driver can recall the setting by pressing the corresponding memory switch or by using a programmed remote keyless entry (RKE) transmitter. Refer to Section 501-09 .

The memory driver seat feature allows the driver to program a personalized seat position that can be recalled using the memory switches or the RKE transmitter. Refer to Section 501-10 .

The memory adjustable pedals and memory powertilt column are also controlled by the DSM. These systems permit the adjustment of the brake, the accelerator pedals and the tilt column by pressing the desired memory set switch or by using a programmed RKE transmitter. Refer to Section 206-00 .

The power fold mirrors are also controlled by the DSM. This system permits the mirrors to be folded in or out using the power mirror switch.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Battery junction box (BJB) fuse 45 (30A) • Smart junction box (SJB) fuse 2 (15A)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the DSM.

9. If the DTCs retrieved are related to the concern, go to the Diagnostic Trouble Code Chart in this section.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

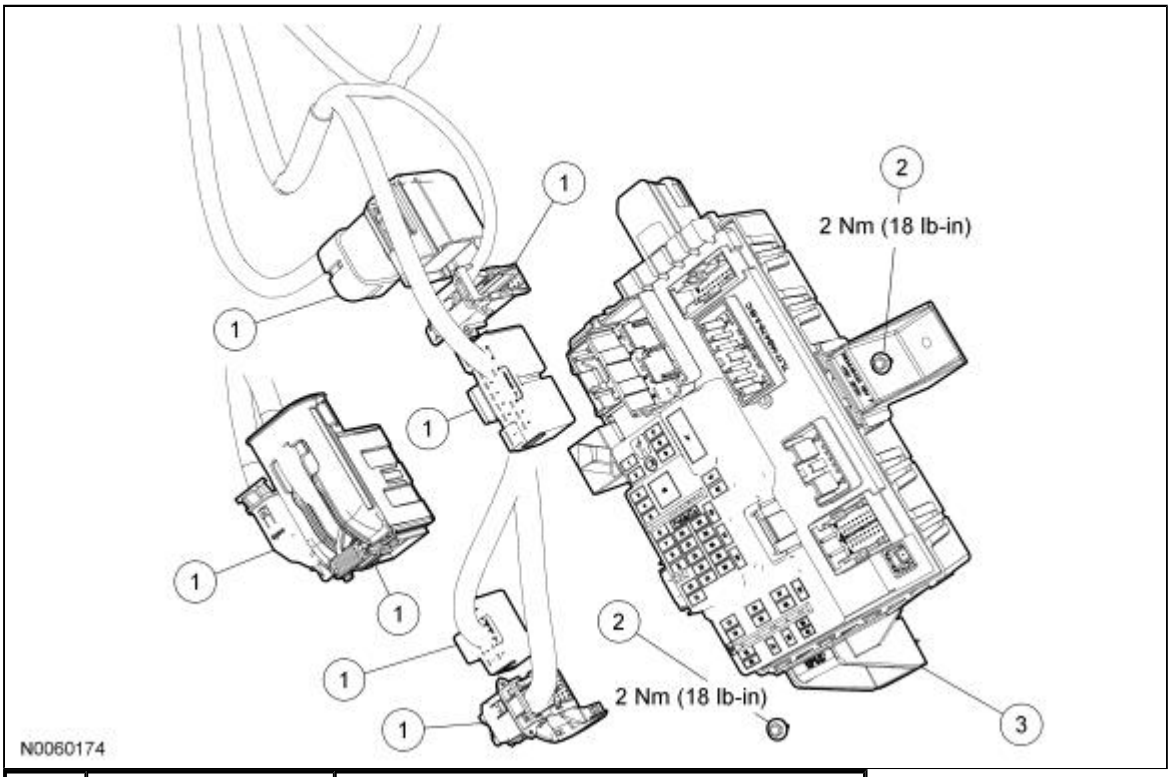
Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the driver seat module (DSM)	• Fuse(s) • Circuitry • DSM	• REFER to Section 418-00 .

Smart Junction Box (SJB)

Printable View (210 KB)



Item	Part Number	Description
1	—	Electrical connectors (part of 14A005)
2	W706287 - S901	SJB bolts (2 required)
3	14B207	SJB

Removal

CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

NOTE: Prior to the removal of the module, it is necessary to upload the module configuration information to a scan tool. This information must be downloaded into the new SJB after installation. For additional information, refer to Section 418-01 .

1. **NOTE:** The tire pressure monitoring system (TPMS) functionality is integral to the SJB.

   NOTE: A new SJB is delivered in "manufacturing mode" with 7 pre-set DTCs. These 7 manufacturing mode DTCs require that a successful configuration of the SJB occurs, then a successful TPMS sensor training occurs, then a successful self-test occurs, including the clearing of all DTCs. All of this is required in order to clear the 7 manufacturing mode DTCs. The 7 manufacturing mode DTCs are as follows:
   - B2477 (Module Configuration Failure)
   - B106D (Tire Pressure Monitor System [TPMS] Initiators Not Configured) This DTC is present when the SJB is not configured, even on applications that are not equipped with initiators.

- B2868 (Left Front Tire Pressure Sensor Fault)
- B2869 (Right Front Tire Pressure Sensor Fault)
- B2870 (Right Rear Tire Pressure Sensor Fault)
- B2871 (Left Rear Tire Pressure Sensor Fault)
- C2780 (ECU in Manufacturer Sub-state)

Upload the module configuration information from the SJB into the scan tool. For additional information, refer to Section 418-01 .

2. Disconnect the battery. For additional information, refer to Section 414-01 .
3. Remove the pin-type retainer and the RH A-pillar lower trim panel.
4. Remove the glove compartment. For additional information, refer to Section 501-12 .
5. Disconnect the 7 electrical connectors.
6. Remove the 2 bolts and the SJB.

Installation

1. Position the SJB and install the 2 bolts.
   - Tighten the screws to 2 Nm (18 lb-in).
2. Connect the 7 electrical connectors.
3. Position the RH A-pillar lower trim panel and install the pin-type retainer.
4. Install the glove compartment. For additional information, refer to Section 501-12 .
5. Connect the battery. For additional information, refer to Section 414-01 .
6. **NOTE:** When successful, this step provides the calibration necessary for the SJB operation and clears DTCs B2477 and B106D. The clearing of these DTCs indicate the calibration data has been successfully downloaded to the SJB.

   Download the SJB configuration information from the scan tool to the SJB. For additional information, refer to Section 418-01 .
7. **NOTE:** When successful, this step clears DTCs B2868, B2869, B2870 and B2871. The clearing of these DTCs indicates the SJB has recognized the tire pressure sensors during the training procedure.

   Train the tire pressure sensors. For additional information, refer to Section 204-04 .
8. **NOTE:** DTC C2780 will not clear if any other DTCs are present in the SJB.

   Carry out the SJB on-demand self-test by clearing DTCs and then retrieving DTCs to confirm all DTCs have been cleared.

Driver Seat Module (DSM)

Printable View (80 KB)

Removal and Installation

CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

NOTE: Prior to the removal of the module, it is necessary to upload the module configuration information to a scan tool. This information must be downloaded into the new DSM after installation. For additional information, refer to Section 418-01 .

1. Upload the module configuration information from the DSM into the scan tool. For additional information, refer to Section 418-01 .
2. **NOTE:** The module is accessed with the seat fully in the UP position.

   Position the DSM forward to remove it from the bracket.
3. Disconnect the battery. For additional information, refer to Section 414-01 .
4. Disconnect the electrical connectors and remove the DSM.
5. **NOTE:** Once the module is installed it is necessary to download the module configuration information from the scan tool into the new module. For additional information, refer to Section 418-01 .

   To install, reverse the removal procedure.

General Specifications

Item	Specification
Adhesives	
Trim and Weatherstrip Adhesive TA-14	—
Lubricants	
Silicone Spray Lubricant XL-6	ESR-M13P4-A
Sealants	
Clear Silicone Rubber TA-32	ESB-M4G92-A
3M Strip-Caulk — Black 051135-08578	WSB-M4G32-C
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Body

Printable View (62 KB)

The body:

- is a cab-forward design.
- is constructed of lightweight, all steel welded material, with bolted removable front fenders and hinged doors.
- has an aluminum liftgate and hood with gas lift cylinders (Expedition).
- has steel fenders and a SMC hood with gas lift cylinders (Navigator).
- has roof and body side panels that are separate pieces.
- is supported by a full frame.

Insulation

Printable View (62 KB)

Insulation is installed:

- under the roof.
- above and below the instrument panel.
- at the cowl sides.
- over the transmission tunnel.
- over the floorpan areas.
- inside the quarter panels.

And has heat-bondable mastic deadeners for improved NVH characteristics (Navigator).

Body Sealer Types And Applications

Printable View (64 KB)

Clear Silicone Rubber

Clear silicone rubber TA-32 or equivalent meeting Ford specification ESB-M4G92-A:

- does not run.
- is fast-drying.
- remains semi-elastic.
- can be used for sealing water leaks and wind noise.

Caulking Cord

3M Strip-Caulk — Black 051135-08578 or equivalent commercially available product meeting Ford specification WSB-M4G32-C:

- has a plastic base with a filler.
- is heavy-bodied.
- is commonly known as perma-gum.
- is used on spot-weld holes, around mounting clips and between surfaces not sealed by a gasket.

Weatherstrip Adhesive

Trim and Weatherstrip Adhesive TA-14 or equivalent:

- is a quick-drying, strong adhesive designed to hold or repair weatherstripping on doors, bodies and the surrounding metal.

Silicone Spray Lubricant

Silicone Spray Lubricant XL-6 meeting Ford specification ESR-M13P4-A:

- is used on the door and window weatherstrip.
- should be applied to weatherstrip at every lubrication period.
- makes doors easier to close.
- avoids weatherstrip squeaks.
- retards weatherstrip wear.
- helps retain door window alignment by reducing friction between the glass frame and rubber weatherstrip.
- should not be used prior to painting.

Body System

Printable View (84 KB)

Inspection and Verification

Leaks

NOTE: Trim will reveal the location of most leaks. Use spray chalk and hose if necessary.

1. Remove any trim or carpet in the general area of the leak.
2. Road test or water hose test the vehicle.
3. Inspect for a dust pattern around the area in question. Inspect for water paths near and above the area in question.
4. Some leaks can be located by placing bright light under the vehicle, removing any necessary trim or carpet, and inspecting the interior of the body at joints and weld lines.

Noise

Wind noise, rattles and their sources are detected by driving the vehicle at highway speeds. The vehicle should be driven in 4 different directions, with all windows closed, radio off, blower motor off and all ventilation ducts open.

Most wind noise leaks will occur at the door and window seals or at the sheet metal joints in the door or the door opening.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Dust and water leaks	• Body sealer missing • Opening in welding or body joints • Components not fully installed • Components missing • Components damaged	• REMOVE trim. CHECK for leaks and SEAL with appropriate sealer. ROAD TEST or WATER TEST for leaks. RECHECK trim for leaks; USE light under vehicle with trim removed. CHECK interior of body at joints and weld lines.
• Dust/water leaks at floor pan and grommets	• Missing or damaged plugs and/or grommets	• CHECK plugs for correct installation. INSTALL new if necessary.
• Door drain holes collecting water	• Holes clogged with mud or road tar	• CLEAN drain holes of dirt and foreign material with a punch or screwdriver. CHECK drain holes regularly.

• Wind noise	• Leaks at door and window seals or sheet metal joints in doors or door openings	• SEAL leaks with Silicone Gasket and Sealant TA-30 or equivalent meeting Ford specification WSE-M2G323-A4.
	• Loose/misaligned weatherstrip	• REATTACH weatherstrip. INSTALL new pin-type retainers if damaged. Use Trim and Weatherstrip Adhesive TA-14 or equivalent as necessary.
	• Poor door fit	• ADJUST the striker or hinges as necessary. For hinge adjustment, refer to Section 501-03 . CHECK for acceptable door efforts after repair.
• Rattles	• Loose objects in door wells, pillars and quarter panels	• CHECK doors by carefully STRIKING underside of door with a rubber mallet. LISTEN for loose objects in door. REPAIR. TIGHTEN body bolts and screws.
	• Misalignment (if tightening bolts does not eliminate rattle)	• REFER to Section 501-03 .
	• Loose weatherstripping and/or anti-squeak material	• APPLY additional sealer. INSTALL in proper location to eliminate rattle.

Vehicles with power running boards

1. Lower the running board.

All vehicles

2. Remove the lower pin-type retainer from the fender.
3. Remove the 8 fender splash shield screws.
4. Remove the 2 inner pin-type retainers from the fender splash shield.
5. Remove the fender splash shield.
6. To install, reverse the removal procedure.

Fender

Printable View (63 KB)

Removal and Installation

1. Remove the fender splash shield. For additional information, refer to Fender Splash Shield in this section.

2. Remove the 2 front bumper cover-to-fender bolts.
   - To install, tighten to 11 Nm (8 lb-ft).

3. Remove the fender-to-radiator support bolt.
   - To install, tighten to 12 Nm (9 lb-ft).

4. Remove the 2 lower fender bolts.
   - To install, tighten to 12 Nm (9 lb-ft).

5. Remove the headlamp.
   - Remove the 2 headlamp bolts.
   - Disconnect the electrical connectors.

6. Remove the cowl panel grille. For additional information, refer to Cowl Panel Grille in this section.

7. Remove the 4 upper fender bolts and remove the fender.
   - To install, tighten to 12 Nm (9 lb-ft).

8. To install, reverse the removal procedure.

Body Closures

Printable View (68 KB)

The power liftgate (PLG) feature allows the customer to automatically open or close the liftgate by: activating the instrument panel control button, activating the remote keyless entry transmitter, lifting the exterior handle (open only) or activating the rear quarter trim-mounted switch. The PLG uses a power cinching system to latch the liftgate.

PLG operation requires the vehicle to be in PARK and the vehicle speed to be less than 5 Km/H (3 mph).

The PLG feature suspends a power open or power close when the ignition key is moved to the START position. The clutch will remain active to hold the liftgate in place during a start operation. Once the ignition key is no longer in the START position, the liftgate power open or power close will resume.

The PLG feature can be enabled/disabled from the message center. When the PLG feature is disabled (OFF), operation from the liftgate handle and liftgate rear control switch are disabled.

The PLG system consists of the following components:

- PLG control switch (located in the instrument panel)
- PLG rear control switch (located in the LH rear quarter trim panel)
- Exterior handle switch
- PLG motor (located behind the LH rear quarter trim panel)
- PLG rod (attached to the PLG motor assembly and liftgate mounting stud)
- Position sensor (located in the PLG motor assembly)
- Pinch strip switches (located on the body above the left and right taillamps)
- PLG latch (located in the middle lower portion of the liftgate)
- Forkbolt switches (located in the PLG latch)
- Sector gear switches (located in the PLG latch)
- Detent switch (located in the PLG latch)
- Unlatch/cinching motor (located in the PLG latch)
- PLG module (located behind the left rear quarter trim panel)

The PLG is controlled by the PLG module.

The PLG module receives inputs from the following:

- Forkbolt switch — primary (determines the position of the latch)
- Forkbolt switch — secondary (determines the position of the latch)
- Sector gear open switch — open (determines the sector gear position)
- Sector gear close switch — close (determines the sector gear position)
- Smart junction box (SJB) (exterior handle)
- Detent switch (determines the position of the latch)
- PLG control switch (located in the instrument panel)
- PLG rear control switch (located in the LH rear quarter trim panel)
- Pinch strip switches (determines if an obstacle is between the pinch strip and liftgate)
- Position sensor (determines the direction, travel speed and obstacle detection of the liftgate)
- Controller area network (CAN) serial communication link

The PLG module sends outputs to the following:

- Liftgate motor
- Liftgate clutch
- Unlatch/cinching motor
- Liftgate chime
- SJB (ajar status)

The liftgate chime sounds an audible chime (located on the PLG motor assembly) for 3 seconds whenever a powered closing operation is initiated or if conditions are not correct for closing. The chime sound serves as a warning to alert the vehicle occupants and any bystanders that the liftgate is being moved in a closing direction by a powered operation. The gate will not be moved for the first second, as a pre-warning of impending gate movement.

The PLG may not operate under the following conditions:

- Low voltage or dead battery
- Disconnected battery
- PLG that has been manually closed and left ajar

If any of these conditions have occurred, the PLG must be reset before carrying out any pinpoint tests. Refer to Power Liftgate Initialization in this section.

Power Liftgate

Printable View (570 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles Of Operation

Power and Ground Requirements

The smart junction box (SJB) fuse 14 (10A) supplies battery logic power required for the software, clutch and internal switching operations. Power is supplied to the motor by bussed electric center (BEC) fuse 27 (30A).

Ground for the PLG module is a separate single connection. Some of the continuous inputs which are at a ground state when ON are also used for logic switching.

PLG Detent Switch, Forkbolt Primary Switch and Forkbolt Secondary Switch

The PLG detent switch, forkbolt primary switch and forkbolt secondary switch provide inputs to the PLG module in order to determine liftgate latch position. The PLG module receives inputs from the PLG detent switch, forkbolt primary switch and forkbolt secondary switch in the following manner:

Latch Switch States

Latch Position	Detent Switch	Forkbolt Secondary Switch	Forkbolt Primary Switch
Fully Unlatched	Open [a]	Grounded	Grounded
In Secondary	Grounded [a]	Open	Grounded
In Primary	Grounded	Open	Open

[a] The detent switch may be in open or grounded state depending on forkbolt position. The detent switch state changes as the forkbolt rotates.

Unlatch/Cinching Motor

The latch uses a bi-directional motor to accomplish both release and cinch operations. The motor is driven in one direction to cinch and driven in the opposite direction to release.

During a cinch operation, power is supplied to the unlatch/cinching motor by the PLG module when the secondary latch position is reached during a power close operation. When the motor activates, it pulls the liftgate into the primary latch position. The PLG module removes power from the unlatch/cinching motor when the primary latch position is reached.

During an unlatch operation, power is supplied to the unlatch/cinching motor by the PLG module when a valid open command is received.

Sector Gear Switches

The sector gear open switch and sector gear close switch provide input to the PLG module in order to determine the position of the sector gear. The sector gear is part of the latch assembly. It is driven by the latch motor and in turn drives the latch mechanism. During a release operation, the PLG module deactivates the unlatch/cinching motor once the end of travel is reached. After a release operation, the PLG module keeps the latch released until the gate moves away from the vehicle. The PLG module then reverses the direction of the unlatch/cinching motor until the sector gear switches indicate the sector gear has returned to the neutral position. Refer to the following table for sector gear switch states:

Sector Gear Switch States

Sector Gear Position	Sector Gear Open Switch	Sector Gear Close Switch
End of Travel	Grounded	Grounded
Release	Open	Grounded
Cinch	Grounded	Open
Neutral	Open	Open

The drive assembly consists of the following:

Position Sensor

When awake, the PLG module supplies a 5-volt reference voltage to the position sensor on a valid open command or anytime the liftgate is in the open position (up to 6 hours). The PLG module constantly supplies the ground. The position sensor has 2 data lines that the PLG module monitors to determine the liftgate movement and position. The PLG module uses the liftgate position information to determine which direction to power the liftgate (open or close) when a valid operation command is received. The movement is monitored to identify obstructions.

Actuator Clutch

The drive assembly actuator clutch separates the drive assembly actuator motor from the liftgate drive gear. This allows manual opening and closing of the liftgate without driving the motor. The PLG module supplies power to the drive assembly actuator clutch for any valid open/close operation. The clutch connects the drive assembly actuator motor to the drive actuator, allowing the motor to turn the actuator and open or close the liftgate.

Actuator Motor

The drive assembly actuator motor is a reversible motor. Upon a valid activation, the PLG module supplies power and ground to the motor circuits depending on the liftgate position and the direction the liftgate needs to be moved.

PLG Control Switch — Instrument Panel

Pressing the instrument panel PLG control switch supplies a momentary ground signal to the PLG module which will open or close the liftgate depending on the conditions.

PLG Rear Control Switch — Quarter Trim Panel

Pressing the PLG rear control switch (located on the LH quarter trim panel) supplies a momentary ground signal to the PLG module which will operate the liftgate depending on the conditions.

Exterior Handle Switch

When the exterior handle switch is activated, the SJB sends a signal to the PLG module which will open the liftgate depending on the conditions.

Remote Keyless Entry (RKE) Operation

The SJB receives a PLG activation command (double press) from the remote keyless entry (RKE) transmitter. The SJB will send a signal on the CAN network to the PLG. The signal transmitted between the SJB and the PLG module is not specific to open or close operation. The PLG module will determine which operation to carry out depending on the liftgate position when the signal is received.

PLG Interface

PLG open operation requires the vehicle to be in PARK and the vehicle speed to be less than 5 km/h (3 mph). The PLG receives information over the CAN network from the powertrain control module (PCM) for the PRNDL position and from the instrument cluster (gateway) for the vehicle speed. These inputs have network diagnostic trouble codes (DTCs). If any vehicle speed sensor (VSS) or transmission range switch DTCs are retrieved and the PLG is not operating, repair these DTCs first.

PLG Operation

The following is a brief explanation of a normal power open cycle of the PLG.

- The power open operation will begin with one of the following methods:
  - The PLG receives a momentary ground signal from the PLG control switch
  - The SJB receives a signal from the remote transmitter key FOB (double button press)
  - The PLG module receives a signal from the SJB indicating the exterior liftgate handle has been activated.
- The PLG module checks the PARK and VSS status from the CAN communication link.
- The PLG module supplies power to the unlatch/cinching motor until the sector gear switches indicate end of travel which releases the PLG latch.
- The PLG detent switch, primary forkbolt switch and secondary forkbolt switch circuits are monitored for correct latch release signals.
- Power is supplied to the drive assembly actuator clutch and motor, opening the PLG.
- The PLG supplies power to the unlatch/cinching motor while monitoring the sector gear switches to return the sector gear to the neutral position.
- When the PLG is opening, the position sensor is monitored for liftgate position and velocity. If an obstruction is detected, the liftgate will stop.
- The PLG full open position is learned by the PLG module during the PLG initialization. When the PLG reaches the full open position, the PLG module removes the power from the drive assembly actuator motor and clutch.

The following is a brief explanation of a normal power close cycle of the PLG.

- The power close operation will begin with one of the following methods:
  - The PLG module receives a momentary ground signal from the PLG control switch
  - The PLG module receives a momentary ground signal from the PLG rear control switch (LH rear quarter panel)
  - The SJB receives a signal from the remote transmitter key FOB (double press)
- The PLG module checks the PARK and vehicle speed status from the CAN communication link.
- The PLG module will start an audible chime.

- After one second of audible chime, power is supplied to the drive assembly actuator clutch and motor as the audible chime continues 3 seconds total.
- As the PLG is powered closed, the position sensor is monitored for liftgate position and velocity. The PLG will reverse if an obstruction is detected.
- Also, as the PLG is powered closed, the pinch strips are monitored for a pinch condition. The PLG will reverse if an obstruction is detected by either pinch strip.
- The PLG detent switch, forkbolt primary switch and forkbolt secondary switch circuits are monitored for correct latch signals.
- When the PLG module receives switch signals indicating the secondary latch position is reached, power is supplied to the unlatch/cinching motor to pull the liftgate into the primary latch position. When primary latch position is reached, power is removed from the drive motor and clutch.
- When the PLG module receives switch signals indicating the primary latch position has been reached (liftgate is fully closed), the PLG module reverses the direction of the unlatch/cinching motor until the sector gear switches indicate the neutral position.

PLG Chime

The PLG module requests a chime to sound for 3 seconds when:

- the PLG module receives a request to power close.
- the liftgate reverses when closing due to an obstacle.
- the liftgate stops opening due to an obstacle.

The PLG module requests a chime to sound for one second when an open or close input is received when:

- the vehicle speed is greater than or equal to 5 km/h (3 mph).
- the ignition key is in the RUN position and the transmission is not in the PARK position.
- the battery voltage is between 8 and 9.5 volts.

The chime will sound continuously for up to 5 minutes when the transmission is shifted out of the PARK position or the vehicle speed exceeds 5 km/h (3 mph) while the liftgate is closing. The chime will stop sounding when the liftgate reaches the latch, 5 minutes has elapsed or the transmission is shifted into the PARK position and the vehicle speed is less than 5 km/h (3 mph).

The chime will sound continuously for up to 5 minutes when the liftgate fails to close to the primary latch position after 20 seconds of powering in the close direction. The chime will stop if the liftgate reaches the primary latch position or 5 minutes has elapsed.

PLG Initialization Procedure

If the PLG module loses the logic battery supply for any reason, such as battery disconnect, module disconnect or if left open for more than 6 hours, the PLG module will lose the PLG position stored in memory and will attempt to open when the liftgate switch is pressed the first time.

The PLG normal operation will not be restored until the PLG position is once again stored into memory. The initialization procedure is the learning process the PLG module uses to restore the PLG position in memory. The PLG module monitors the position sensor data received during the initial power open-and-close operation to learn the position.

Refer to Power Liftgate Initialization in this section.

PLG Awake/Sleep Status

- The PLG module is in the awake state whenever the ignition is in the RUN position.
- The PLG module is in the awake state while carrying out a close or an open operation, including cinch.

- The PLG module is in the sleep state when all of the following conditions exist:
  - The latch is not in the fully unlatched position
  - The ignition is in the OFF position
  - No power operation is active
  - No wakeup inputs have changed state for more than 20 seconds
- The PLG module is also in the sleep state when all of the following conditions exist:
  - The latch is in the unlatched position
  - The ignition is in the OFF position
  - No power operation is active
  - No wakeup inputs have changed state for more than 6 hours

The wakeup inputs for the PLG are:

- PLG open/close switch request signal
- Forkbolt primary signal
- Forkbolt secondary signal
- Detent switch signal
- Rear control switch
- Exterior handle switch
- Glass ajar switch
- CAN

Inspection and Verification

1. Verify the customer concern.

2. The battery voltage must be at normal operating levels in order for the PLG to open and close correctly. Make sure the battery and charging systems are operating correctly before proceeding with the PLG diagnosis.

3. Visually inspect for obvious signs of mechanical and electrical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical	Electrical

• Power liftgate (PLG) drive assembly
• PLG rod assembly
• PLG cinching latch
• PLG pinch strip switches
• Liftgate and liftgate hinges
• Liftgate assist cylinders
• Liftgate strikers
• Exterior release handle
• Liftgate weatherstrip
• Liftgate alignment to body and striker
• Wedges

	• SJB

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible)

before proceeding to the next step.

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

6. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the power liftgate module (PLG) or smart junction box (SJB).

8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

9. Clear the continuous DTCs and carry out the self-test diagnostics for the PLG or SJB.

10. If the DTCs retrieved are related to the concern, go to the PLG Module Diagnostic Trouble Code (DTC) Chart or the SJB Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

11. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

SJB Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1331	Decklid Ajar Rear Door Circuit Failure	REFER to Section 501-14 to diagnose the decklid ajar circuit.
B2666	Liftgate Release Switch Circuit Failure	REFER to Section 501-14 to diagnose the liftgate handle release switch.
B273A	Liftgate Release Output Circuit Short to Ground	Go To Pinpoint Test B .
B273B	Liftgate Release Output Circuit Open or Short to Battery	Go To Pinpoint Test B .

PLG Module Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B106E	Solid State Driver Disabled Due to Short Circuit	Go To Pinpoint Test A .

B106F	Module Disabled Due to External Fault	VERIFY there is no short to ground in circuit CPR57 (GN/WH) or CPR58 (GN/OG). REPAIR circuit(s) as necessary. INSTALL a new PLG module. REFER to Power Liftgate Module in this section. TEST for normal operation.
B107D	Obstacle Detected While Closing	VERIFY obstacle is not present. CLEAR the DTCs. TEST for normal operation. If DTC B107D returns, Go To Pinpoint Test D .
B1105	Rear Open/Close Switch Active During Self-Test	Go To Pinpoint Test B .
B1179	Latch Motor Circuit Short to Battery	Go To Pinpoint Test A .
B117A	Latch Motor Circuit Short to Ground	Go To Pinpoint Test A .
B117B	Latch Motor Circuit Open	Go To Pinpoint Test A .
B117C	Latch Centering Switch Invalid	If any other PLG related DTCs are present, diagnose those first. If no other PLG DTCs are present, Go To Pinpoint Test I .
B1317	Battery Voltage High	REFER to Section 414-00 to diagnose the charging system.
B1318	Battery Voltage Low	REFER to Section 414-00 to diagnose the charging system.
B1342	ECU is Defective	INSTALL a new PLG module. REFER to Power Liftgate Module in this section.
B2019	Liftgate Exceeded Time Allowed to Cinch Door	Go To Pinpoint Test C .
B201A	Power System Disabled Due to High Manual Closing Speed	INSTALL new liftgate assist cylinders. CLEAR the DTCs. TEST for normal operation. If DTC B201A returns, INSTALL a new PLG module. REFER to Power Liftgate Module in this section.
B236A	Chime Output Circuit Open	Go To Pinpoint Test E .
B2418	Sensor Power Short to Ground	Go To Pinpoint Test A .
B2419	Sensor 1 Invalid	Go To Pinpoint Test A .
B2420	Sensor 2 Invalid	Go To Pinpoint Test A .
B2552	Vbatt 2 Circuit Open	Go To Pinpoint Test A .
B2699	Left Pinch Strip Open or Short to Battery	Go To Pinpoint Test F .
B2700	Right Pinch Strip Open or Short to Battery	Go To Pinpoint Test F .
B2701	Left Pinch Strip Stuck Active	Go To Pinpoint Test G .
B2702	Right Pinch Strip Stuck Active	Go To Pinpoint Test G .
B2703	Open/Close Switch Stuck Active	Go To Pinpoint Test B .
B2718	Liftgate/Decklid Ajar Output Short to Battery	REFER to Section 417-02 to diagnose the liftgate/decklid ajar switch circuit.
B2721	Liftgate/Decklid Ajar Output Short to	REFER to Section 417-02 to diagnose the liftgate/decklid ajar switch circuit.

	Ground or Open	
B2723	Glass Position Switch Active During Self-Test	REFER to Section 417-02 to diagnose the liftgate glass ajar switch.
B2819	Gate Motor Circuit Short to Battery	Go To Pinpoint Test A .
B2903	Chime Output Circuit Short to Battery	Go To Pinpoint Test E .
B2908	Latch Switch Invalid	For an inoperative PLG, Go To Pinpoint Test A . For a PLG that stops in SECONDARY LATCH position, Go To Pinpoint Test C .
B2935	Drive Unit Failure	Go To Pinpoint Test A .
B2936	Gate Motor Open	Go To Pinpoint Test A .
B2937	Gate Motor Short to Ground	Go To Pinpoint Test A .
B2939	Gate Clutch Short to Ground or Open	Go To Pinpoint Test A .
B2940	Chime Output Circuit Short to Ground	Go To Pinpoint Test E .
U0140	Lost Communication With Body Control Module (GEM)	REFER to Section 418-00 to diagnose the lost communication with the GEM.
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	REFER to Section 418-00 to diagnose the lost communication with the IC.
U2050	No Application Present	REFER to Section 418-01 to carry out Programmable Module Installation (PMI). CLEAR the DTCs. RETRIEVE the DTCs and VERIFY successful module configuration. If DTC U2050 is retrieved again, INSTALL a new PLG module. REFER to Section 419-10 . REPEAT the self-test.
U2051	One or More Calibration Files Missing/Corrupt	REFER to Section 418-01 to carry out Programmable Module Installation (PMI). CLEAR the DTCs. RETRIEVE the DTCs and VERIFY successful module configuration. If DTC U2051 is retrieved again, INSTALL a new PLG module. REFER to Section 419-10 . REPEAT the self-test.
U2471	Unexpected PRNDL State	VERIFY the transmission gear selector (PRNDL) is in PARK. CLEAR the DTCs. REPEAT the self-test. If DTC U2471 is retrieved again, RETRIEVE and FOLLOW non-network DTCs from the transmission control module (TCM) (if equipped) or powertrain control module (PCM) and instrument cluster module. REFER to Section 413-01 and Section 307-01A or Section 307-01B . If no DTCs are present, INSTALL a new PLG module. REFER to Power Liftgate Module in this section.
U2472	Unexpected Ignition State	VERIFY the ignition key is in the ON position. CLEAR the DTCs. REPEAT the self-test. If DTC U2472 is retrieved again, RETRIEVE and FOLLOW non-network DTCs from the generic electronic module (GEM). REFER to Section 211-05 . If no DTCs are present, INSTALL a new PLG module. REFER to Power Liftgate Module in this section.
U2473	Unexpected Vehicle Speed (VSS)	CLEAR the DTCs. REPEAT the self-test. If DTC U2473 is retrieved again, RETRIEVE and FOLLOW non-network DTCs from the instrument cluster. REFER to Section 413-01 to diagnose the vehicle speed sensor (VSS). If no related DTCs or symptoms are present, INSTALL a new PLG module. REFER to Power Liftgate Module in this section.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The power liftgate is inoperative — does not open or close	• Liftgate assist cylinders • Fuse(s) • Circuitry • Liftgate motor/clutch assembly • Liftgate position sensor • PLG latch • PLG module • PLG rod	• If DTC B201A is present, INSTALL new liftgate assist cylinders. CLEAR the DTCs. TEST for normal operation. If DTC B201A returns, INSTALL a new PLG module. REFER to Power Liftgate Module in this section. • Go To Pinpoint Test A .
• The power liftgate is inoperative from an individual switch	• Circuitry • PLG control switch (instrument panel) • PLG close switch (quarter trim panel) • Exterior handle switch • PLG module	• Go To Pinpoint Test B .
• The power liftgate does not operate from the remote transmitter	• Batteries • Remote transmitter programming • Remote transmitter • SJB	• PROGRAM the remote transmitter. REFER to Section 501-14 . INSTALL a new remote transmitter. TEST system for normal operation.
• The power liftgate does not operate correctly — stops in secondary latch position (does not pull into primary latch position)	• Circuitry • PLG latch • PLG module • Mechanical binding • PLG rod	• TURN the PLG OFF (disable) from the message center and manually operate the liftgate. If no mechanical binding exists, Go To Pinpoint Test C . If mechanical binding does exist, REFER to Liftgate in this section.
• The power liftgate stops during power open operation	• The vehicle was started or taken out of PARK during a power open operation • Mechanical binding	• Manually CLOSE the liftgate to the primary latch position and OPEN the liftgate, using the exterior handle or liftgate control switch with the vehicle in PARK and the ignition in the ON position. If mechanical binding does exist, REFER to Liftgate in this section.
• The power liftgate does not operate correctly — reverses during the power close operation	• Circuitry • PLG latch • Position sensor • PLG module • PLG rod	• Go To Pinpoint Test D .

	• Mechanical binding	
• The power liftgate chime is inoperative	• Circuitry • PLG chime • PLG module	• Go To Pinpoint Test E .
• The power liftgate has excessive noise during operation	• Alignment • Mechanical binding	• CHECK the liftgate alignment. REFER to Liftgate in this section. • TURN the PLG OFF (disable) from the message center and manually operate the liftgate. If mechanical binding does exist, REFER to Liftgate in this section.
• The power liftgate does not operate correctly — pinch strip does not stop/reverse the liftgate	• Circuitry • Pinch strip • PLG module	• Go To Pinpoint Test F .
• The power liftgate does not power close (power open OK)	• Initialization • Circuitry • Pinch strip • PLG latch • PLG module • Mechanical binding	• INITIALIZE the PLG. REFER to Power Liftgate Initialization in this section. • TURN the PLG OFF (disable) from the message center and manually operate the liftgate. If no mechanical binding exists, Go To Pinpoint Test G . If mechanical binding does exist, REFER to Liftgate in this section.
• The power liftgate does not power open (power close OK)	• Circuitry • PLG latch • Mechanical binding • PLG module	• Go To Pinpoint Test H .

Pinpoint Tests

Pinpoint Test A: The Power Liftgate is Inoperative — Does Not Open or Close

Refer to Wiring Diagrams Cell 109 , Power Liftgate for schematic and connector information.

Normal Operation

If the power liftgate (PLG) is operated from the PLG control switch (instrument panel), circuit CPR63 (GY/YE) is grounded by the open/close switch, which signals the PLG module of the open/close request.

If the PLG is in the closed position and the conditions are correct, the PLG module supplies 12 volts to the unlatch/cinching motor on circuit CPR62 (WH/BU), 12 volts to the clutch on circuit CPR69 (BN/BU) and 12 volts to the motor on circuit CPR57 (GN/WH). As the liftgate is moving in the open direction, the PLG module monitors the position sensor for door speed to detect obstacles.

If the PLG is in the open position and the conditions are correct, the PLG module supplies 12 volts to the

clutch on circuit CPR69 (BN/BU) and 12 volts to the motor on circuit CPR58 (GN/OG). As the liftgate is moving in the close direction, the PLG module monitors the position sensor for door speed to detect obstacles.

Possible Causes

- PLG module diagnostic trouble code (DTC) B106E solid state driver disabled due to short circuit
- PLG module DTC B106F module disabled due to external fault
- PLG module DTC B117A latch motor circuit short to ground
- PLG module DTC B117B latch motor circuit open
- PLG module DTC B1179 latch motor circuit short to battery
- PLG module DTC B2418 sensor power short to ground
- PLG module DTC B2419 sensor 1 invalid
- PLG module DTC B2420 sensor 2 invalid
- PLG module DTC B2552 vbatt 2 circuit open
- PLG module DTC B2819 gate motor circuit short to battery
- PLG module DTC B2908 latch switch invalid
- PLG module DTC B2935 drive unit failure
- PLG module DTC B2936 gate motor open
- PLG module DTC B2937 gate motor short to ground
- PLG module DTC B2939 gate clutch short to ground or open
- Open in circuit SBB27 (BU/RD), SBP14 (BN/RD), GD149 (BK/GY) or RPR55 (WH/BU)
- Open or short to ground in circuit CPR64 (VT/OG), CPR65 (BU/GN), CPR66 (GY/YE) or CPR55 (GN/BU)
- Open, short to voltage or short to ground in circuit VPR53 (BU/WH), VPR54 (BU/BN), CPR61 (BN), CPR62 (WH/BU), CPR57 (GN/WH), CPR58 (GN/OG) or CPR69 (BN/BU)
- Fuse(s)
- PLG latch
- Motor/clutch assembly
- Optical sensor
- PLG module
- PLG rod

PINPOINT TEST A: THE POWER LIFTGATE IS INOPERATIVE — DOES NOT OPEN OR CLOSE

Test Step	Result / Action to Take
A1 RETRIEVE THE DTCs FROM THE PLG MODULE	
• Use the recorded PLG module DTCs from the continuous and PLG module self-tests. • **Are any PLG module DTCs recorded?**	**Yes** For DTC B106F, REFER to the PLG Module Diagnostic Trouble Code (DTC) Chart. For DTC B2908, GO to A5 . For DTC B2418, B2419 or B2420 GO to A17 . For DTC B2935, GO to A10 . For DTC B2552, GO to A13 .

	For DTC B2936, B2819, B2937 or B2939, GO to A14 . For DTC B106E, GO to A16 . For DTC B1179, B117A, or B117B, GO to A27 . **No** GO to A2 .
A2 CHECK THE OPERATION OF THE PLG SWITCHES • Vehicle in PARK. • **NOTE:** Make sure the PLG is enabled (ON) in the vehicle message center. • Close the liftgate to the full closed position (manually if necessary). • Activate the PLG from the PLG control switch (instrument panel). • Activate the PLG from the remote transmitter. • Activate the PLG from the liftgate exterior handle. • **Does the PLG power open from any switch?**	**Yes** Go To Pinpoint Test B . **No** GO to A3 .
A3 CHECK CIRCUIT SBP14 (BN/RD) FOR AN OPEN • Disconnect PLG Module C4174A. • Measure the voltage between PLG module C4174A-9, circuit SBP14 (BN/RD), harness side and ground.  N0059376 • **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** VERIFY the smart junction box (SJB) fuse 14 (10A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.
A4 CHECK CIRCUIT GD149 (BK/GY) FOR AN OPEN • Key in OFF position. • Measure the resistance between PLG module C4174A-1, circuit GD149 (BK/GY), harness side and ground.  N0059377 • **Is the resistance less than 5 ohms?**	**Yes** RECONNECT PLG system electrical connectors and GO to A4 . **No** REPAIR the circuit. TEST the system for normal operation.
A5 CHECK THE DETENT AND FORKBOLT SWITCH PID • Enter the following diagnostic mode on the diagnostic tool: Primary Forkbolt, Secondary Forkbolt and Detent Switch PIDs.	**Yes** GO to A10 .

- **NOTE:** The liftgate is in the primary position when the liftgate is in the full closed position. The liftgate is in the UNLATCH position when the liftgate is open and completely out of the striker. The liftgate can be placed in the unlatched position by lifting up on the liftgate handle.
- Begin with the liftgate in the open position, then slowly close the liftgate into each of the latch positions specified by the table below.

Liftgate Latch Position	Detent Switch PID	Secondary Forkbolt Switch PID	Primary Forkbolt Switch PID
Fully Unlatched	Not active [a]	Active	Active
In primary	Active	Not active	Not active

[a] If detent switch is active in the fully unlatched position, manually attempt to rotate the forkbolt towards the latched position.

- **Do the switch states agree with the table?**

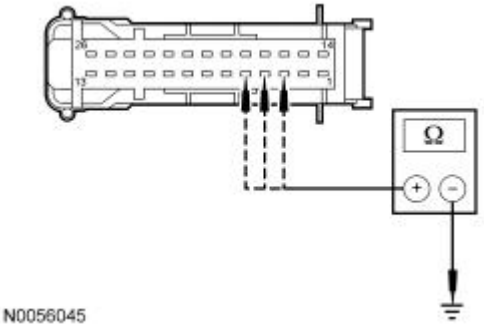
No
GO to A6 .

A6 CHECK THE OPERATION OF THE DETENT AND FORKBOLT SWITCHES

- Key in OFF position.
- Disconnect: PLG Module C4174B.
- Measure the resistance between PLG module C4174B, harness side and ground at each of the connector pins and each latch position specified by the table below.

Liftgate Latch Position	C4174B Circuit	Resistance
Fully Unlatched	Pin 3, circuit CPR66 (GY/YE)	Greater than 10,000 ohms [a]
Fully Unlatched	Pin 5, circuit CPR64 (VT/OG)	Less than 5 ohms
Fully Unlatched	Pin 4, circuit CPR65 (BU/GN)	Less than 5 ohms
Primary	Pin 3, circuit CPR66 (GY/YE)	Less than 5 ohms
Primary	Pin 5, circuit CPR64 (VT/OG)	Greater than 10,000 ohms
Primary	Pin 4, circuit CPR65 (BU/GN)	Greater than 10,000 ohms

[a] If resistance measured is less than 5 ohms, manually rotate the forkbolt to the latched position and re-test.



- **Do the resistance values agree with the table?**

Yes
GO to A31 .

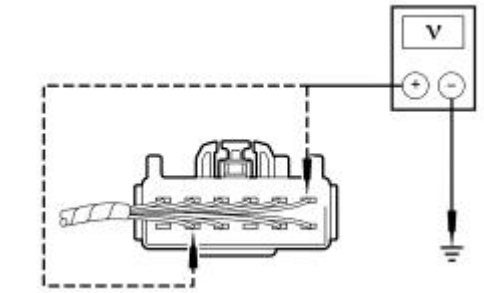
No
GO to A7 .

A7 CHECK THE DETENT AND FORKBOLT SWITCH GROUND CIRCUIT	
• Disconnect: Liftgate Latch/Unlatch Assembly C4339. • Measure the resistance between PLG latch/unlatch assembly C4339-8, circuit GD149 (BK/GY), harness side and ground.  N0056046 • **Is the resistance less than 5 ohms?**	**Yes** GO to A8 . **No** REPAIR the circuit. TEST the system for normal operation.
A8 CHECK THE DETENT AND FORKBOLT SWITCH CIRCUITS FOR AN OPEN	
• Measure the resistance between PLG latch/unlatch assembly C4339, harness side and PLG module C4174B, harness side using the following table: **C4339 Pin** / **Circuit** / **C4174B Pin** 1 / CPR64 (VT/OG) / 5 3 / CPR65 (BU/GN) / 4 2 / CPR66 (GY/YE) / 3  N0056047 • **Is the resistance less than 5 ohms on all circuits?**	**Yes** GO to A9 . **No** REPAIR the circuit. TEST the system for normal operation.
A9 CHECK THE DETENT AND FORKBOLT SWITCH CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between PLG module C4174B-5, circuit CPR64 (VT/OG), harness side and ground; between PLG module C4174B-4, circuit CPR65 (BU/GN), harness side and ground; then between PLG module C4174B-3, circuit CPR66 (GY/YE), harness side and ground.	**Yes** CHECK the PLG latch connector for bent or corroded connections on the component side and harness side. REPAIR as necessary. INSTALL a new PLG latch. REFER to Section 501-14 . TEST the system for normal operation.

 N0056045 • **Are the resistances greater than 10,000 ohms on all circuits?**	**No** REPAIR the circuit. TEST the system for normal operation.
A10 CHECK PLG ROD OPERATION	

• Check for correct function of PLG rod and cable.
  ▪ Properly attached to motor and liftgate.
  ▪ Cable turns with actuator.
• **Is the PLG rod operating correctly?**
	Yes
	GO to A11 .
	
	No
	REPAIR as necessary. If installing a new PLG rod, REFER to Power Liftgate Rod in this section. TEST the system for normal operation.

A11 CHECK FOR VOLTAGE AT THE PLG MOTOR AND CLUTCH	
• Key in ON position. • Liftgate in the fully closed position. • With the motor/clutch connected and while activating the PLG control switch, measure the voltage between PLG motor/clutch C4332-1, circuit CPR57 (GN/WH) backprobe and ground; then between PLG motor/clutch C4332-2, circuit CPR69 (BN/BU), backprobe and PLG motor/clutch C4332-7, circuit GD149 (BK/GY), backprobe.  N0059379 • **Are both of the voltages greater than 10 volts while activating the PLG switch?**	**Yes** If no DTCs were present, GO to A18 . If DTC(s) were present, INSTALL a new PLG motor. REFER to Power Liftgate Motor in this section. TEST the system for normal operation. **No** GO to A12 .
A12 CHECK THE MOTOR AND CLUTCH VOLTAGE OUTPUTS AT THE PLG MODULE	
• With the PLG module connected, measure the voltage between PLG module C4174A-6, circuit CPR58 (GN/OG), backprobe and ground; then between PLG module C4174A-8, circuit CPR69 (BN/BU), backprobe and ground.	**Yes** GO to A14 . **No** GO to A13 .

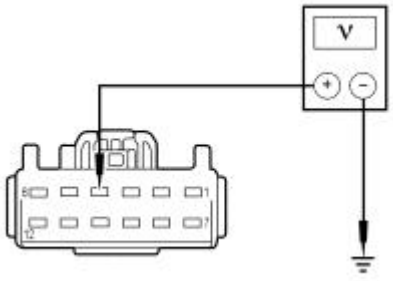


N0059620

- **Are the voltages greater than 10 volts while activating the PLG switch?**

A13 CHECK FOR VOLTAGE AT THE PLG MODULE

- Key in OFF position.
- Disconnect: PLG Module C4174A.
- Measure the voltage between PLG module C4174A-4 circuit SBB27 (BU/RD), harness side and ground.



N0056050

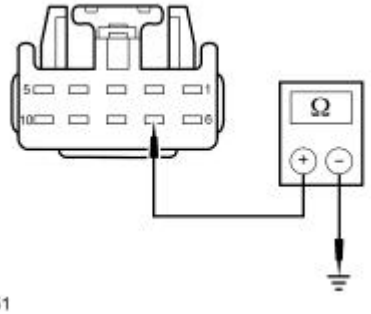
- **Is the voltage greater than 10 volts?**

Yes
If you are here because of DTC B2552, GO to A31 . Otherwise, GO to A18 .

No
VERIFY BEC fuse 27 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

A14 CHECK CIRCUIT CLUTCH GROUND CIRCUIT GD149 (BK/GY) FOR AN OPEN

- Key in OFF position.
- Disconnect: PLG Module C4174A.
- Disconnect: PLG Motor C4332.
- Measure the resistance between PLG motor C4332-7, circuit GD149 (BK/GY), harness side and ground.



N0056051

- **Is the resistances less than 5 ohms?**

Yes
GO to A15 .

No
REPAIR the circuit. TEST the system for normal operation.

A15 CHECK THE MOTOR/CLUTCH CIRCUITS FOR AN OPEN

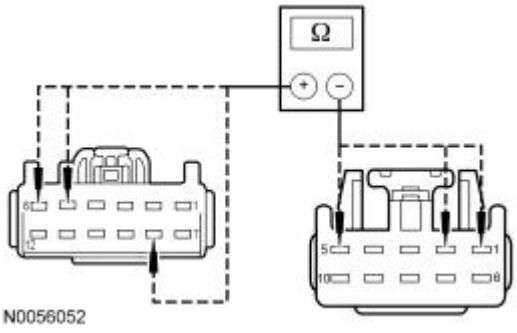
- Measure the resistance between PLG module C4174A, harness side and the PLG motor/clutch C4332, harness side, using the following chart:

C4174A Pin	Circuit	C4332 Pin
5	CPR57 (GN/WH)	1

Yes
GO to A16 .

No
REPAIR the circuit. TEST the system for normal operation.

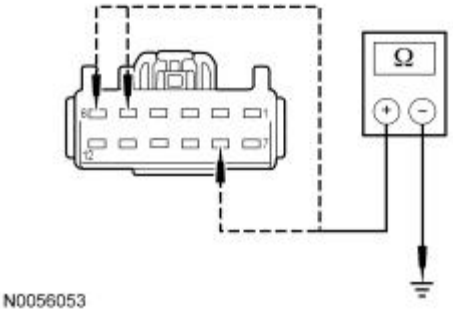
6	CPR58 (GN/OG)	5
8	CPR69 (BN/BU)	2



- **Are the resistances less than 5 ohms?**

A16 CHECK THE MOTOR/CLUTCH CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: PLG Module C4174A.
- Disconnect: PLG Motor C4332.
- Measure the resistance between PLG module C4174A-5, circuit CPR57 (GN/WH), harness side and ground; between PLG module C4174A-6, circuit CPR58 (GN/OG), harness side and ground; then between PLG module C4174A-8, circuit CPR69 (BN/BU), harness side and ground.



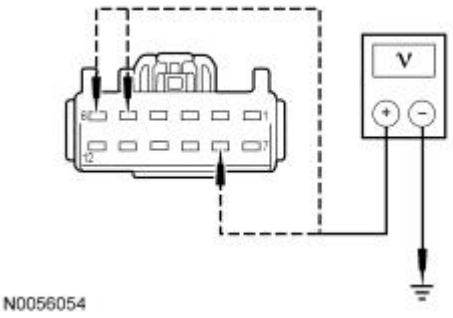
- **Are the resistances greater than 10,000 ohms?**

Yes
GO to A17 .

No
REPAIR the circuit. If DTC B106E was present, CLEAR DTCs. TEST the system for normal operation.

A17 CHECK THE MOTOR/CLUTCH CIRCUITS FOR A SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between PLG module C4174A-5, circuit CPR57 (GN/WH), harness side and ground; between PLG module C4174A-6, circuit CPR58 (GN/OG), harness side and ground; then between PLG module C4174A-8, circuit CPR69 (BN/BU), harness side and ground.



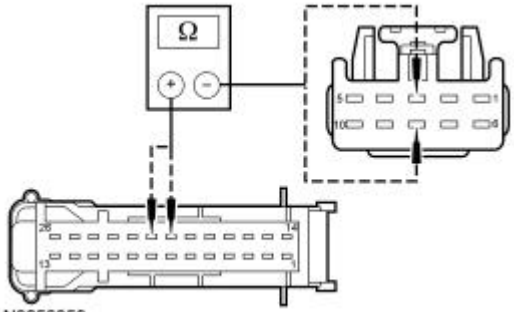
Yes
REPAIR the circuit. TEST the system for normal operation.

No
CHECK the PLG motor and clutch connectors for corrosion or pushed-out pins. REPAIR as necessary. TEST the system for normal operation.

• **Is voltage present?**	
A18 CHECK THE POSITION SENSOR PID	
• Key in OFF position. • Connect: All PLG Module Connectors. • Connect: PLG Motor C4332. • Key in ON position. • Open the liftgate to the full open position. • Enter the following diagnostic mode on the diagnostic tool: PLG Module Position Sensor PIDs. • Monitor the PLG position sensor 1 and position sensor 2 PIDs while slowly closing the liftgate. • **Do both of the PID values alternate from ACTIVE to INACTIVE while the liftgate is moving?**	**Yes** GO to A27 . **No** GO to A19 .
A19 CHECK THE POSITION SENSOR POWER CIRCUIT	
• Disconnect: PLG Motor C4332. • Key in ON position. • Measure the voltage between PLG motor C4332-4, circuit CPR55 (GN/BU), harness side and ground.  N0056055 • **Is the voltage approximately 5 volts?**	**Yes** GO to A21 . **No** GO to A20 .
A20 CHECK THE POSITION SENSOR POWER CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Disconnect: PLG Module C4174B. • Measure the resistance between PLG module C4174B-6, circuit CPR55 (GN/BU), harness side and PLG motor C4332-4, circuit CPR55 (GN/BU), harness side; and between PLG module C4174B-6, circuit CPR55 (GN/BU), harness side and ground.  N0056056 • **Is the resistance less than 5 ohms between PLG module and PLG motor; and greater than 10,000 ohms between PLG module and ground?**	**Yes** GO to A31 . **No** REPAIR the circuit. TEST the system for normal operation.
A21 CHECK THE POSITION SENSOR RETURN CIRCUIT	
• Key in OFF position. • Disconnect: PLG Motor C4332. • Key in ON position. • Measure the resistance between PLG motor C4332-9, circuit	**Yes** GO to A23 . **No**

RPR55 (WH/BU), harness side and ground.  N0056057 • **Is the resistance less than 5 ohms?**	GO to A22 .
A22 CHECK THE POSITION SENSOR RETURN CIRCUIT FOR AN OPEN	
• Key in OFF position. • Disconnect: PLG Module C4174B. • Measure the resistance between PLG module C4174B-7, circuit RPR55 (WH/BU), harness side and PLG motor C4332-9, circuit RPR55 (WH/BU), harness side.  N0056058 • **Is the resistance less than 5 ohms?**	**Yes** GO to A31 . **No** REPAIR the circuit. TEST the system for normal operation.
A23 CHECK THE POSITION SENSOR CIRCUITS FOR AN OPEN	
• Key in ON position. • Measure the voltage between PLG motor C4332-8, circuit VPR53 (BU/WH), harness side and ground; and between PLG motor C4332-3, circuit VPR53 (BU/WH), harness side and ground.  N0056061 • **Is the voltage approximately 5 volts for both measurements?**	**Yes** INSTALL a new PLG motor. REFER To Power Liftgate Motor in this section. TEST the system for normal operation. **No** GO to A24 .
A24 CHECK THE POSITION SENSOR CIRCUITS FOR AN OPEN	
• Key in OFF position. • Disconnect: PLG Module C4174B. • Measure the resistance between PLG motor C4332, harness side and PLG module C4174B, harness side using the following chart:	**Yes** GO to A25 . **No** REPAIR the circuit. TEST the system for

C4332 Pin	Circuit	C4174B Pin
8	VPR53 (BU/WH)	21
3	VPR54 (BU/BN)	20



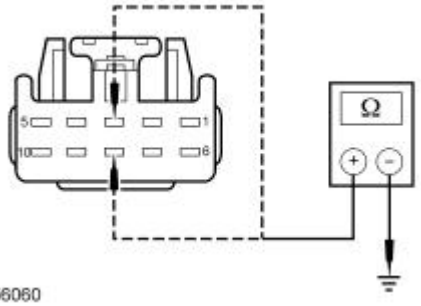
N0056059

- **Are the resistances less than 5 ohms?**

normal operation.

A25 CHECK THE POSITION SENSOR CIRCUITS FOR A SHORT TO GROUND

- Measure the resistance between PLG motor C4332-3, circuit VPR54 (BU/BN), harness side and ground; and between PLG motor C4332-8, circuit VPR53 (BU/WH), harness side and ground.



N0056060

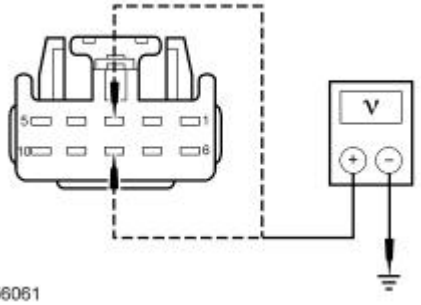
- **Are the resistances greater than 10,000 ohms?**

Yes
GO to A26 .

No
REPAIR the circuit.
TEST the system for normal operation.

A26 CHECK THE POSITION SENSOR CIRCUITS FOR A SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between PLG motor C4332-3, circuit VPR54 (BU/BN), harness side and ground; and between PLG motor C4332-8, circuit VPR53 (BU/WH), harness side and ground.



N0056061

- **Is voltage present?**

Yes
REPAIR the circuit.
TEST the system for normal operation.

No
GO to A31 .

A27 CHECK THE UNLATCH/CINCHING MOTOR CIRCUITS

- Key in OFF position.

Yes

• Disconnect: PLG Module C4174A. • Close the PLG. • **CAUTION: Do not apply power and ground to the unlatch actuator circuits for more than a few seconds or damage to the motor may occur.** • Connect a fused (10A) jumper wire between PLG module C4174A-3, circuit CPR62 (WH/BU), harness side and the positive side of the battery; and connect a jumper between PLG module C4174A-2, circuit CPR61 (BN), harness side and ground.  N0056062 • **Does the unlatch/cinching motor activate when power and ground are applied?**	GO to A31 . **No** GO to A28 .
A28 CHECK THE UNLATCH/CINCHING MOTOR CIRCUITS FOR AN OPEN	
• Disconnect: Liftgate Latch/Unlatch Assembly C4339. • Measure the resistance between PLG latch C4339-5, circuit CPR61 (BN), harness side and PLG module C4174A-2, circuit CPR61 (BN), harness side; then between PLG latch C4339-7, circuit CPR62 (WH/BU), harness side and PLG module C4174A-3, circuit CPR62 (WH/BU), harness side.  N0056063 • **Are the resistances less than 5 ohms?**	**Yes** GO to A29 . **No** REPAIR the circuit. TEST the system for normal operation.
A29 CHECK THE UNLATCH/CINCHING MOTOR CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between PLG latch C4339-5, circuit CPR61 (BN), harness side and ground; then between PLG latch C4339-7, circuit CPR62 (WH/BU), harness side and ground.	**Yes** GO to A30 . **No** REPAIR the circuit. TEST the system for normal operation.

 N0056064 • **Are the resistances greater than 10,000 ohms?**	
A30 CHECK THE UNLATCH ACTUATOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between PLG latch C4339-5, circuit CPR61 (BN), harness side and ground; then between PLG latch C4339-7, circuit CPR62 (WH/BU), harness side and ground.  N0056065 • **Is voltage present on either circuit?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** CHECK the PLG latch connectors for bent or corroded connections on the component side and harness side. REPAIR as necessary. INSTALL a new PLG latch. REFER to Section 501-14 . TEST the system for normal operation.
A31 CHECK FOR CORRECT PLG MODULE OPERATION	

• Disconnect all the PLG module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all the PLG module connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PLG module. REFER to Power Liftgate Module in this section. REPEAT the PLG module self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the PLG module self-test.

Pinpoint Test B: The Power Liftgate is Inoperative From an Individual Switch

Refer to Wiring Diagrams Cell 109 , Power Liftgate for schematic and connector information.

Normal Operation

If the power liftgate (PLG) is operated from the PLG control switch (instrument panel), circuit CPR63 (GY/YE) is grounded by the open/close switch, which signals the PLG module of the open/close request.

If the PLG is operated from the rear switch (quarter trim panel), circuit CPR70 (GN) is grounded by the rear switch through circuit GD149 (BK/GY). If the PLG is operated from the liftgate handle, the smart junction box (SJB) sends a voltage signal to the PLG module through circuit CPL10 (GN/WH).

Possible Causes

- SJB module diagnostic trouble code (DTC) B2666 liftgate release switch circuit failure
- SJB module DTC B273A liftgate release output circuit short to ground
- SJB module DTC B273B liftgate release output circuit open or short to battery
- PLG module DTC B1105 rear open/close switch active during self-test
- PLG module DTC B2703 open/close switch active during self-test
- Open, short to power or short to ground in circuit CPL10 (GN/WH)
- Open in circuit GD138 (BK/WH) or GD149 (BK/GY)
- Open or short to ground in circuit CPR70 (GN) or CPR63 (GY/YE)
- PLG control switch (instrument panel)
- PLG rear control switch (quarter trim panel)
- PLG module
- SJB

PINPOINT TEST B: THE POWER LIFTGATE IS INOPERATIVE FROM AN INDIVIDUAL SWITCH

Test Step	Result / Action to Take
B1 RETRIEVE THE DTCs FROM THE PLG MODULE AND THE SJB	
• Use the recorded PLG module DTCs and SJB DTCs from the continuous and self-tests. • **Are any PLG DTCs present?**	**Yes** For SJB DTC B2666, REFER to Section 501-14 to diagnose the liftgate handle release switch. For SJB module DTC B273A or B273B, GO to B4 . For PLG module DTC B1105, GO to B8 . For PLG module DTC B2703, GO to B12 . **No** GO to B2 .
B2 CHECK THE OPERATION OF THE PLG SWITCHES	
• **NOTE:** Make sure the PLG is ON (enabled) in the message center. • Close the liftgate to the full closed position (manually if necessary). • Electronically unlock the vehicle. • Activate the PLG from the PLG control switch (instrument panel). • Activate the PLG from the remote transmitter. • Activate the PLG from the liftgate exterior handle. • With the liftgate in the open position, activate the PLG from the PLG rear control switch (quarter trim panel). • **Does the PLG open/close from at least one switch?**	**Yes** If the PLG control switch is inoperative, GO to B12 . If the exterior handle is inoperative, GO to B3 . If the remote transmitter is inoperative, GO to Symptom Chart . If the PLG rear control switch is inoperative, GO to B8 .

	No Go To Pinpoint Test A to diagnose an inoperative PLG.
B3 CHECK THE LIFTGATE HANDLE PID • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: SJB Liftgate_Switch_Status PID. • While monitoring the SJB Liftgate_Switch_Status PID, activate the liftage release handle. • **Does the switch change states from INACTIVE to ACTIVE when the liftgate release handle is activated?**	**Yes** GO to B4 . **No** REFER to Section 501-14 to diagnose the liftgate handle release switch.
B4 CHECK THE SJB RELEASE CIRCUIT OUTPUT • Disconnect: PLG Module C4174B. • Enter the following diagnostic mode on the diagnostic tool: SJB Liftgate_Release_Ckt PID. • Measure the voltage between PLG module C4174B-12, circuit CPL10 (GN/WH), harness side and ground while commanding the SJB Liftgate_Release_Ckt PID active and inactive.  N0056066 • **Is the voltage greater than 10 volts when the Liftgate_Release_Ckt PID is active, and less than 2 volts when the Liftgate_Release_Ckt PID is inactive?**	**Yes** GO to B16 . **No** GO to B5 .
B5 CHECK CIRCUIT CPL10 (GN/WH) FOR A SHORT TO VOLTAGE • Key in OFF position. • Disconnect: SJB Module C2280E. • Key in ON position. • Measure the voltage between PLG module C4174B-12, circuit CPL10 (GN/WH), harness side and ground.  N0056066 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to B6 .
B6 CHECK CIRCUIT CPL10 (GN/WH) FOR AN OPEN OR SHORT TO GROUND • Measure the resistance between PLG module C4174B-12, circuit CPL10 (GN/WH), harness side and SJB C2280E-15,	**Yes** GO to B7 .

circuit CPL10 (GN/WH), harness side; and between PLG module C4174B-12, circuit CPL10 (GN/WH), harness side and ground.  N0056067 • **Is the resistance less than 5 ohms between PLG module and the SJB; and greater than 10,000 ohms between PLG module and ground?**	**No** REPAIR the circuit. TEST the system for normal operation.
B7 CHECK FOR CORRECT SJB MODULE OPERATION	
• Disconnect all the SJB and PLG module connectors. • Check for: ▪ corrosion. ▪ pushed-out pins. • Connect all the SJB and PLG module connectors and make sure they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB module. REPEAT the SJB module self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the SJB module self-test.
B8 CHECK PLG REAR SWITCH OPERATION	
• Enter the following diagnostic mode on the diagnostic tool: Rear Open/Close Switch (REAR_OC) PID. • Operate the PLG rear control switch while monitoring the REAR_OC PID. • **Does the PID state change/agree with the switch status?**	**Yes** GO to B16 . **No** GO to B9 .
B9 CHECK PLG REAR SWITCH CIRCUIT OPERATION	
• Disconnect: PLG Module C4174B. • Measure the resistance between PLG module C4174B-24, circuit CPR70 (GN), harness side and ground while depressing and releasing the PLG rear switch.  N0056068 • **Is the resistance less than 5 ohms with the PLG rear switch depressed, and greater than 10,000 ohms when the PLG rear switch is released?**	**Yes** GO to B16 . **No** GO to B10 .
B10 CHECK CIRCUIT GD149 (BK/GY) FOR AN OPEN	

• Key in OFF position. • Disconnect: PLG Rear Open/Close Switch C4333. • Measure the resistance between PLG rear switch C4333-5, circuit GD149 (BK/GY), harness side and ground.  N0056069 • **Is the resistance less than 5 ohms?**	**Yes** GO to B11 . **No** REPAIR the circuit. TEST the system for normal operation.
B11 CHECK CIRCUIT CPR70 (GN) FOR AN OPEN OR SHORT TO GROUND	
• Measure the resistance between PLG module C4174B-24, circuit CPR70 (GN), harness side and PLG rear switch C4333-1, circuit CPR70 (GN), harness side; and between PLG module C4174B-24, circuit CPR70 (GN), harness side and ground.  N0056070 • **Is the resistance less than 5 ohms between PLG module and PLG rear switch; and greater than 10,000 ohms between PLG module and ground?**	**Yes** INSTALL a new PLG rear switch. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
B12 CHECK PLG SWITCH OPERATION	
• Enter the following diagnostic mode on the diagnostic tool: Open/Close Switch PID. • Operate the PLG control switch (instrument panel switch) while monitoring the OPEN/CLOSE switch PID. • **Does the PID state change/agree with the switch status?**	**Yes** GO to B16 . **No** GO to B13 .
B13 CHECK PLG CONTROL SWITCH CIRCUIT OPERATION	
• Disconnect: PLG Module C4174B. • Measure the resistance between PLG module C4174B-16, circuit CPR63 (GY/YE), harness side and ground while depressing and releasing the PLG control switch (instrument panel).	**Yes** GO to B16 . **No** GO to B14 .

 N0056071 • **Is the resistance less than 5 ohms with the PLG control switch depressed, and greater than 10,000 ohms when the PLG control switch is released?**	
B14 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN • Key in OFF position. • Disconnect: Liftgate/Traction Control/Hazard Switch C2361. • Measure the resistance between PLG control switch C2361-4, circuit GD138 (BK/WH), harness side and ground.  N0056072 • **Is the resistance less than 5 ohms?**	**Yes** GO to B15 . **No** REPAIR the circuit. TEST the system for normal operation.
B15 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN OR SHORT TO GROUND • Measure the resistance between PLG module C4174B-16, circuit CPR63 (GY/YE), harness side and PLG control switch C2361-7, circuit CPR63 (GY/YE), harness side; and between PLG module C2361-7, circuit CPR63 (GY/YE), harness side and ground.  N0056073 • **Is the resistance less than 5 ohms between PLG module and PLG control switch; and greater than 10,000 ohms between PLG module and ground?**	**Yes** INSTALL a new liftgate/traction control/hazard switch. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

B16 CHECK FOR CORRECT PLG MODULE OPERATION
• Disconnect all the PLG module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all the PLG module connectors and make sure they
	Yes
	INSTALL a new PLG module. REFER to Power Liftgate Module in this section. REPEAT the PLG

are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	module self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the PLG module self-test.

Pinpoint Test C: The Power Liftgate Does Not Operate Correctly — Stops in Secondary Latch Position (Does Not Pull into Primary Latch Position)

Refer to Wiring Diagrams Cell 109 , Power Liftgate for schematic and connector information.

Normal Operation

When the power liftgate (PLG) moves in the close direction, the PLG module monitors the detent switch, secondary forkbolt switch and the primary forkbolt switch. When the combination of signals is received that indicates the liftgate has reached the secondary latch position, the PLG module supplies 12 volts to the unlatch/cinching motor on circuit CPR61 (BN) and ground on circuit CPR62 (WH/BU). The unlatch/cinching motor rotates the latch mechanism which pulls the liftgate into primary latch position.

Possible Causes

- PLG module diagnostic trouble code (DTC) B2019 liftgate exceeded time allowed to cinch door
- PLG module DTC B2908 latch switch invalid
- Liftgate alignment
- Latch striker alignment
- Circuit GD149 (BK/GY) open
- Circuit CPR64 (VT/OG), CPR65 (BU/GN) or CPR66 (GY/YE) open or short to ground
- PLG latch
- PLG module

PINPOINT TEST C: THE POWER LIFTGATE DOES NOT OPERATE CORRECTLY — STOPS IN SECONDARY LATCH POSITION (DOES NOT PULL INTO PRIMARY LATCH POSITION)

Test Step	Result / Action to Take
C1 RETRIEVE THE DTCs FROM THE PLG MODULE	
• Use the recorded PLG module DTCs from the continuous and self-tests. • **Is PLG DTC B2019 present?**	**Yes** CHECK the liftgate alignment. REFER to Hinge Adjustment — Liftgate in this section. If OK, GO to C2 . **No** GO to C2 .
C2 CHECK THE DETENT AND FORKBOLT SWITCH PID	
• Enter the following diagnostic mode on the diagnostic tool: Primary Forkbolt, Secondary Forkbolt and Detent Switch PIDs. • **NOTE:** The liftgate is in the primary position when the liftgate is in the full closed position. The liftgate is in the UNLATCH position	**Yes** GO to C7 . **No**

when the liftgate is open and completely out of the striker. The liftgate can be placed in the unlatched position by lifting up on the liftgate handle.

- Begin with the liftgate in the open position, then slowly close the liftgate into each of the latch positions specified by the table below.

Liftgate Latch Position	Detent Switch PID	Secondary Forkbolt Switch PID	Primary Forkbolt Switch PID
Fully Unlatched	Not active [a]	Active	Active
In primary	Active	Not active	Not active

[a] If detent switch is active in the fully unlatched position, manually attempt to rotate the forkbolt towards the latched position.

- **Do the switch states agree with the table?**

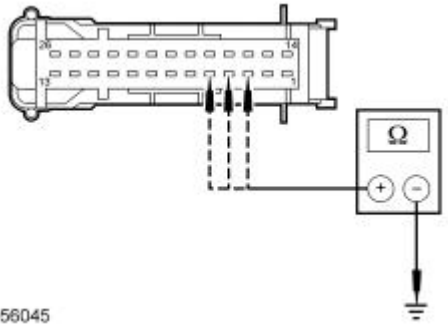
GO to C3 .

C3 CHECK THE OPERATION OF THE DETENT AND FORKBOLT SWITCHES

- Key in OFF position.
- Disconnect: PLG Module C4174B.
- Measure the resistance between PLG module C4174B, harness side and ground at each of the connector pins and each latch position specified by the table below.

Liftgate Latch Position	C4174B Circuit	Resistance
Fully Unlatched	Pin 3, circuit CPR66 (GY/YE)	Greater than 10,000 ohms [a]
Fully Unlatched	Pin 5, circuit CPR64 (VT/OG)	Less than 5 ohms
Fully Unlatched	Pin 4, circuit CPR65 (BU/GN)	Less than 5 ohms
Primary	Pin 3, circuit CPR66 (GY/YE)	Less than 5 ohms
Primary	Pin 5, circuit CPR64 (VT/OG)	Greater than 10,000 ohms
Primary	Pin 4, circuit CPR65 (BU/GN)	Greater than 10,000 ohms

[a] If resistance measured is less than 5 ohms, manually rotate the forkbolt to the latched position and re-test.



- **Do the resistance values agree with the table?**

Yes
GO to C7 .

No
GO to C4 .

C4 CHECK THE DETENT AND FORKBOLT SWITCH GROUND CIRCUIT

• Disconnect: PLG Latch/Unlatch Assembly C4339. • Measure the resistance between PLG latch C4339-8, circuit GD149 (BK/GY), harness side and ground.  N0056046 • **Is the resistance less than 5 ohms?**	**Yes** GO to C5 . **No** REPAIR the circuit. TEST the system for normal operation.
C5 CHECK THE DETENT AND FORKBOLT SWITCH CIRCUITS FOR AN OPEN	
• Measure the resistance between PLG latch C4339, harness side and PLG module C4174B, harness side, using the following table: **C4339 Pin** / **Circuit** / **C4174B Pin** 1 / CPR64 (VT/OG) / 5 3 / CPR65 (BU/GN) / 4 2 / CPR66 (GY/YE) / 3  N0056075 • **Is the resistance less than 5 ohms on all circuits?**	**Yes** GO to C6 . **No** REPAIR the circuit. TEST the system for normal operation.
C6 CHECK THE DETENT AND FORKBOLT SWITCH CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between PLG module C4174B-5, circuit CPR64 (VT/OG), harness side and ground; then between PLG module C4174B-4, circuit CPR65 (BU/GN), harness side and ground; then between PLG module C4174B-3, circuit CPR66 (GY/YE), harness side and ground.	**Yes** CHECK the PLG latch connectors for bent or corroded connections on the component side and harness side. REPAIR as necessary. INSTALL a new PLG latch. REFER to Section 501-14 . TEST the system for normal operation. **No** REPAIR the circuit.

 • **Is the resistance greater than 10,000 ohms on all circuits?**	TEST the system for normal operation.
C7 CHECK FOR CORRECT PLG MODULE OPERATION	

• Disconnect all the PLG module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all the PLG module connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PLG module. REFER to Power Liftgate Module in this section. REPEAT the PLG module self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the PLG module self-test.

Pinpoint Test D: The Power Liftgate Does Not Operate Correctly — Reverses During the Power Close Operation

Refer to Wiring Diagrams Cell 109 , Power Liftgate for schematic and connector information.

Normal Operation

When the power liftgate (PLG) moves in the close direction, the PLG module monitors the pinch strips and position sensor for obstacle detection. The PLG module uses a 5-volt reference signal on circuit CPR52 (YE/VT) and a return signal on circuit RPR52 (VT/GY) for the left pinch strip. The PLG module uses a 5-volt reference signal on circuit CPR51 (YE/OG) and a return signal on circuit RPR52 (VT/GY) for the right pinch strip. The right and left pinch strip return signal circuits are spliced together.

Possible Causes

- PLG module diagnostic trouble code (DTC) B107D obstacle detected while closing
- PLG module DTC B2419 sensor 1 invalid
- PLG module DTC B2420 sensor 2 invalid
- Open, short to power or short to ground in circuit VPR54 (BU/BN) or VPR53 (BU/WH)
- Open or short to ground in circuit CPR55 (GN/BU)
- Mechanical binding
- PLG latch striker alignment
- PLG latch
- Position sensor
- PLG module
- Wedges

PINPOINT TEST D: THE POWER LIFTGATE DOES NOT OPERATE CORRECTLY — REVERSES DURING THE POWER CLOSE OPERATION

Test Step	Result / Action to Take

D1 CHECK THE MANUAL OPERATION OF THE LIFTGATE
• Turn the PLG OFF (disable) from the message center.
• While manually opening and closing the liftgate, check the liftgate for:
  ▪ liftgate/wedge alignment.
  ▪ strut operation (struts should push open liftgate when beyond half open).
  ▪ PLG rod (should move freely while manually opening and closing liftgate and should be securely mounted to the liftgate and bracket).
  ▪ PLG latch (should latch completely).
• **Does the liftgate open and close correctly?**
	Yes
	If the liftgate reverses near the midpoint of travel, GO to D2.
	
	If the liftgate reverses near or at the latch, GO to D10.
	
	No
	REPAIR as necessary. ALIGN as necessary. REFER to Liftgate in this section. TEST the system for normal operation.

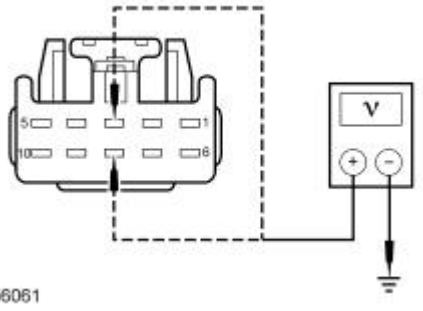
D2 CHECK THE POSITION SENSOR PID • Key in OFF position. • Connect: All PLG Module Connectors. • Connect: PLG Motor C4332. • Key in ON position. • Open the liftgate to the full open position. • Enter the following diagnostic mode on the diagnostic tool: PLG Module Position Sensor PIDs. • Monitor the PLG position sensor 1 and position sensor 2 PIDs while slowly closing the liftgate. • **Do both of the PID values alternate from ACTIVE to INACTIVE while the liftgate is moving?**	**Yes** GO to D11. **No** GO to D3.
D3 CHECK THE POSITION SENSOR POWER CIRCUIT • Disconnect: PLG Motor C4332. • Key in ON position. • Measure the voltage between PLG motor C4332-4, circuit CPR55 (GN/BU), harness side and ground.  N0056055 • **Is the voltage approximately 5 volts?**	**Yes** GO to D5. **No** GO to D4.
D4 CHECK THE OPTICAL SENSOR POWER CIRCUIT FOR AN OPEN OR SHORT TO GROUND • Key in OFF position. • Disconnect: PLG Module C4174B. • Measure the resistance between PLG module C4174B-6, circuit CPR55 (GN/BU), harness side and PLG motor C4332-4, circuit	**Yes** GO to D16. **No**

CPR55 (GN/BU), harness side; and between PLG module C4174B-6, circuit CPR55 (GN/BU), harness side and ground.  N0056056 • **Is the resistance less than 5 ohms between PLG module and PLG motor; and greater than 10,000 ohms between PLG module and ground?**	REPAIR the circuit. TEST the system for normal operation.
D5 CHECK THE POSITION SENSOR RETURN CIRCUIT	
• Key in OFF position. • Disconnect: PLG Motor C4332. • Key in ON position. • Measure the resistance between PLG motor C4332-9, circuit RPR55 (WH/BU), harness side and ground.  N0056057 • **Is the resistance less than 5 ohms?**	**Yes** GO to D7 . **No** GO to D6 .
D6 CHECK THE POSITION SENSOR RETURN CIRCUIT FOR AN OPEN	
• Key in OFF position. • Disconnect: PLG Module C4174B. • Measure the resistance between PLG module C4174B-7, circuit RPR55 (WH/BU), harness side and PLG motor C4332-9, circuit RPR55 (WH/BU), harness side.  N0056058 • **Is the resistance less than 5 ohms?**	**Yes** GO to D16 . **No** REPAIR the circuit. TEST the system for normal operation.
D7 CHECK THE POSITION SENSOR CIRCUITS FOR AN OPEN	
• Key in ON position. • Measure the voltage between PLG motor C4332-8, circuit VPR53 (BU/WH), harness side and ground; and between PLG motor C4332-3, circuit VPR53 (BU/WH), harness side and	**Yes** INSTALL a new PLG motor. REFER To Power Liftgate Motor in this

ground.  N0056061 • **Is the voltage approximately 5 volts for both measurements?**	section. TEST the system for normal operation. **No** GO to D8 .
D8 CHECK THE POSITION SENSOR CIRCUITS FOR AN OPEN	
• Key in OFF position. • Disconnect: PLG Module C4174B. • Measure the resistance between PLG motor C4332, harness side and PLG module C4174B, harness side using the following chart: **C4332 Pin** / **Circuit** / **C4174B Pin** 8 / VPR53 (BU/WH) / 21 3 / VPR54 (BU/BN) / 20  N0056059 • **Are the resistances less than 5 ohms?**	**Yes** GO to D9 . **No** REPAIR the circuit. TEST the system for normal operation.
D9 CHECK THE POSITION SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between PLG motor C4332-3, circuit VPR54 (BU/BN), harness side and ground; and between PLG motor C4332-8, circuit VPR53 (BU/WH), harness side and ground.  N0056060 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to D10 . **No** REPAIR the circuit. TEST the system for normal operation.
D10 CHECK THE POSITION SENSOR CIRCUITS FOR A SHORT TO	

VOLTAGE

- Key in ON position.
- Measure the voltage between PLG motor C4332-3, circuit VPR54 (BU/BN), harness side and ground; and between PLG motor C4332-8, circuit VPR53 (BU/WH), harness side and ground.



N0056061

- **Is voltage present?**

Yes
REPAIR the circuit. TEST the system for normal operation.

No
GO to D16 .

D11 CHECK THE DETENT AND FORKBOLT SWITCH PID

- Enter the following diagnostic mode on the diagnostic tool: Primary Forkbolt, Secondary Forkbolt and Detent Switch PIDs.
- **NOTE:** The liftgate is in the primary position when the liftgate is in the full closed position. The liftgate is in the UNLATCH position when the liftgate is open and completely out of the striker. The liftgate can be placed in the unlatched position by lifting up on the liftgate handle.
- Begin with the liftgate in the open position, then slowly close the liftgate into each of the latch positions specified by the table below.

Liftgate Latch Position	Detent Switch PID	Secondary Forkbolt Switch PID	Primary Forkbolt Switch PID
Fully Unlatched	Not active [a]	Active	Active
In primary	Active	Not active	Not active

[a] If detent switch is active in the fully unlatched position, manually attempt to rotate the forkbolt towards the latched position.

- **Do the switch states agree with the table?**

Yes
GO to D16 .

No
GO to D12 .

D12 CHECK THE OPERATION OF THE DETENT AND FORKBOLT SWITCHES

- Key in OFF position.
- Disconnect: PLG Module C4174B.
- Measure the resistance between PLG module C4174B, harness side and ground at each of the connector pins and each latch position specified by the table below.

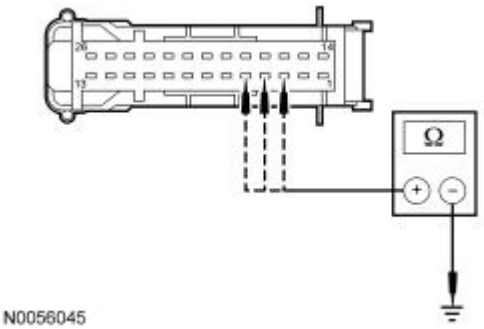
Liftgate Latch Position	C4174B Circuit	Resistance
Fully Unlatched	Pin 3, circuit CPR66 (GY/YE)	Greater than 10,000 ohms [a]
Fully Unlatched	Pin 5, circuit CPR64 (VT/OG)	Less than 5 ohms
Fully Unlatched	Pin 4, circuit CPR65 (BU/GN)	Less than 5 ohms

Yes
GO to D16 .

No
GO to D13 .

Primary	Pin 3, circuit CPR66 (GY/YE)	Less than 5 ohms
Primary	Pin 5, circuit CPR64 (VT/OG)	Greater than 10,000 ohms
Primary	Pin 4, circuit CPR65 (BU/GN)	Greater than 10,000 ohms

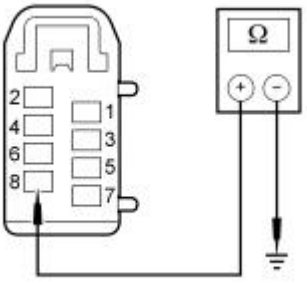
[a] If resistance measured is less than 5 ohms, manually rotate the forkbolt to the latched position and re-test.



- **Do the resistance values agree with the table?**

D13 CHECK THE DETENT AND FORKBOLT SWITCH GROUND CIRCUIT

- Disconnect: Liftgate Latch/Unlatch Assembly C4339.
- Measure the resistance between PLG latch/unlatch assembly C4339-8, circuit GD149 (BK/GY), harness side and ground.



- **Is the resistance less than 5 ohms?**

Yes
GO to D14 .

No
REPAIR the circuit.
TEST the system for normal operation.

D14 CHECK THE DETENT AND FORKBOLT SWITCH CIRCUITS FOR AN OPEN

- Measure the resistance between PLG latch/unlatch assembly C4339, harness side and PLG module C4174B, harness side using the following table:

C4339 Pin	Circuit	C4174B Pin
1	CPR64 (VT/OG)	5
3	CPR65 (BU/GN)	4
2	CPR66 (GY/YE)	3

Yes
GO to D15 .

No
REPAIR the circuit.
TEST the system for normal operation.

 N0056047 • **Is the resistance less than 5 ohms on all circuits?**	
D15 CHECK THE DETENT AND FORKBOLT SWITCH CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between PLG module C4174B-5, circuit CPR64 (VT/OG), harness side and ground; between PLG module C4174B-4, circuit CPR65 (BU/GN), harness side and ground; then between PLG module C4174B-3, circuit CPR66 (GY/YE), harness side and ground.  N0056045 • **Are the resistances greater than 10,000 ohms on all circuits?**	**Yes** CHECK the PLG latch connector for bent or corroded connections on the component side and harness side. REPAIR as necessary. INSTALL a new PLG latch. REFER to Section 501-14 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
D16 CHECK FOR CORRECT PLG MODULE OPERATION	

• Disconnect all the PLG module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all the PLG module connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PLG module. REFER to Power Liftgate Module in this section. REPEAT the PLG module self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the PLG module self-test.

Pinpoint Test E: The Power Liftgate Chime is Inoperative

Refer to Wiring Diagrams Cell 109 , Power Liftgate for schematic and connector information.

Normal Operation

The power liftgate (PLG) chime is controlled by the PLG module. To activate the chime, the PLG module

supplies a high frequency voltage output on circuit CPR56 (VT/BN) and ground on circuit RPR56 (GY/VT).

Possible Causes

- PLG module diagnostic trouble code (DTC) B236A chime output circuit open
- PLG module DTC B2903 chime output circuit short to battery
- PLG module DTC B2940 chime output circuit short to ground
- Circuit CPR56 (VT/BN) or RPR56 (GY/VT) open, short to voltage or short to ground
- Chime

PINPOINT TEST E: THE POWER LIFTGATE CHIME IS INOPERATIVE

Test Step	Result / Action to Take
E1 CHECK FOR VOLTAGE TO THE PLG CHIME • Key in ON position. • Set the parking brake to the ON position. • Open the liftgate. • **NOTE:** The PLG module applies voltage to the PLG chime for one second after the rear PLG switch is pressed, when the transmission is not in the PARK position and the liftgate is in the OPEN position. • With the PLG chime still connected, press the rear PLG switch and measure the voltage between PLG chime C4186-1, circuit CPR56 (VT/BN), back probe and PLG chime C4186-2, circuit RPR56 (GY/VT), back probe.  N0056076 • **Is any voltage present?**	**Yes** INSTALL a new PLG motor. TEST the system for normal operation. **No** GO to E2 .
E2 CHECK THE PLG CHIME CIRCUITS FOR AN OPEN • Key in OFF position. • Disconnect: PLG Chime C4186. • Disconnect: PLG Module C4174B. • Measure the resistance between PLG module C4174B-9, circuit CPR56 (VT/BN), harness side and PLG chime C4186-1, circuit CPR56 (VT/BN), harness side; then between PLG module C4174B-22, circuit RPR56 (GY/VT), harness side and PLG chime C4186-2, circuit RPR56 (GY/VT), harness side.	**Yes** GO to E3 . **No** REPAIR the circuit. TEST the system for normal operation.

 N0056077 • **Are the resistances less than 5 ohms?**	
E3 CHECK THE PLG CHIME CIRCUITS FOR A SHORT TO GROUND	**Yes** GO to E4 . **No** REPAIR the circuit. TEST the system for normal operation.
• Measure the resistance between PLG chime C4186-1, circuit CPR56 (VT/BN), harness side and ground; then between PLG chime C4186-2, circuit RPR56 (GY/VT), harness side and ground.  N0056078 • **Are the resistances greater than 10,000 ohms?**	
E4 CHECK THE PLG CHIME CIRCUITS FOR A SHORT TO VOLTAGE	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to E5 .
• Measure the voltage between PLG chime C4186-1, circuit CPR56 (VT/BN), harness side and ground; then between PLG chime C4186-2, circuit RPR56 (GY/VT), harness side and ground.  N0056079 • **Is voltage present?**	
E5 CHECK FOR CORRECT PLG MODULE OPERATION	**Yes** INSTALL a new PLG module. REFER to Power Liftgate Module in this section. REPEAT the PLG module self-test. **No** The system is operating correctly at this time. Concern may

• Disconnect all the PLG module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all the PLG module connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**	

	have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the PLG module self-test.

Pinpoint Test F: The Power Liftgate Does Not Operate Correctly — Pinch Strip Does Not Stop/Reverse the Liftgate

Refer to Wiring Diagrams Cell 109 , Power Liftgate for schematic and connector information.

Normal Operation

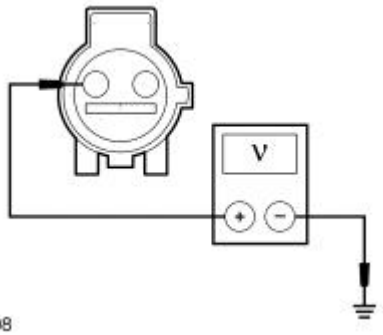
When the power liftgate (PLG) moves in the close direction, the PLG module monitors the pinch strips and position sensor for obstacle detection. The PLG module uses a 5-volt reference signal on circuit CPR52 (YE/VT) and a return signal on circuit RPR52 (VT/GY) for the left pinch strip. The PLG module uses a 5-volt reference signal on circuit CPR51 (YE/OG) and a return signal on circuit RPR52 (VT/GY) for the right pinch strip. The right and left pinch strip return signal circuits are spliced together.

Possible Causes

- PLG module diagnostic trouble code (DTC) B2699 left pinch strip open or short to battery
- PLG module DTC B2700 right pinch strip open or short to battery
- Circuit CPR51 (YE/OG), CPR52 (YE/VT) or RPR52 (VT/GY) open
- Pinch strip
- PLG module

PINPOINT TEST F: THE POWER LIFTGATE DOES NOT OPERATE CORRECTLY — PINCH STRIP DOES NOT STOP/REVERSE THE LIFTGATE

Test Step	Result / Action to Take
F1 CHECK THE PINCH STRIP OPERATION	
• Enter the following diagnostic mode on the diagnostic tool: Left Pinch Strip Status (LFT_PINCH) and Right Pinch Strip Status (RT_PINCH) PIDs. • Activate the PLG left and right pinch strips while observing the LFT_PINCH and RT_PINCH PIDs. • **Does the PID state change/agree with the pinch strip status?**	**Yes** GO to F5 . **No** GO to F2 .
F2 CHECK THE PINCH STRIP SIGNAL CIRCUITS	
• Key in OFF position. • Disconnect: Pinch Strip (Left C4172, Right C4173). • Key in ON position. • Measure the voltage between left pinch strip C4172-1, circuit CPR52 (YE/VT), harness side and ground; and between right pinch strip C4173-1, circuit CPR51 (YE/OG), harness side and ground.	**Yes** GO to F4 . **No** GO to F3 .



A0091408

- **Are the voltages approximately 5 volts?**

F3 CHECK THE PINCH STRIP SIGNAL CIRCUITS FOR AN OPEN	
• Key in OFF position. • Disconnect: PLG Module C4174B. • Measure the resistance between left pinch strip C4172-1, circuit CPR52 (YE/VT), harness side and PLG module C4174B-25, circuit CPR52 (YE/VT), harness side.  N0056080 • Then measure the resistance between right pinch strip C4173-1, circuit CPR51 (YE/OG), harness side and PLG module C4174B-1, circuit CPR51 (YE/OG), harness side.  N0056081 • **Are the resistances less than 5 ohms?**	**Yes** GO to F5 . **No** REPAIR the circuit. TEST the system for normal operation.
F4 CHECK THE PINCH STRIP RETURN CIRCUIT FOR AN OPEN	
• Key in OFF position. • Disconnect: PLG Module C4174B. • Measure the resistance between left pinch strip C4172-2, circuit RPR52 (VT/GY), harness side and PLG module C4174B-8, circuit RPR52 (VT/GY), harness side; and between right pinch strip C4173-2, circuit RPR52 (VT/GY), harness side and PLG module C4174B-8, circuit RPR52 (VT/GY), harness side.	**Yes** INSTALL a new pinch strip. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

 N0056082 • **Are the resistances less than 5 ohms?**	
F5 CHECK FOR CORRECT PLG MODULE OPERATION	

• Disconnect all the PLG module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all the PLG module connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PLG module. REFER to Power Liftgate Module in this section. REPEAT the PLG module self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the PLG module self-test.

Pinpoint Test G: The Power Liftgate Does Not Power Close (Power Open OK)

Refer to Wiring Diagrams Cell 109 , Power Liftgate for schematic and connector information.

Normal Operation

When the power liftgate (PLG) moves in the close direction, the PLG module monitors the pinch strips and position sensor for obstacle detection. The PLG module uses a 5-volt reference signal on circuit CPR52 (YE/VT) and a return signal on circuit RPR52 (VT/GY) for the left pinch strip. The PLG module uses a 5-volt reference signal on circuit CPR51 (YE/OG) and a return signal on circuit RPR52 (VT/GY) for the right pinch strip. The right and left pinch strip return signal circuits are spliced together.

NOTE: Initialize the PLG before proceeding with this pinpoint test. Refer to Power Liftgate Initialization in this section.

Possible Causes

- PLG module diagnostic trouble code (DTC) B2701 left pinch strip stuck active
- PLG module DTC B2702 right pinch strip stuck active
- Circuit GD149 (BK/GY) open
- Circuit CPR65 (BU/GN), CPR66 (GY/YE) or CPR64 (VT/OG) open or short to ground
- Circuit CPR52 (YE/VT) or CPR51 (YE/OG) short to ground
- PLG latch
- Pinch strip
- PLG module

PINPOINT TEST G: THE POWER LIFTGATE DOES NOT POWER CLOSE (POWER OPEN OK)

Test Step	Result / Action to Take
G1 CHECK THE PINCH STRIP PID • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: PLG Pinch Strip. • Check the left and right pinch strip PIDs. • **Do either of the pinch strip PIDs indicate ACTIVE?**	**Yes** GO to G2 . **No** GO to G4 .
G2 CHECK THE PINCH STRIP SIGNAL CIRCUIT • Key in OFF position. • Disconnect: Pinch Strip (Left C4172 or Right C4173). • Key in ON position. • Measure the voltage between left pinch strip C4172-1, circuit CPR52 (YE/VT), harness side and ground; and between right pinch strip C4173-1, circuit CPR51 (YE/OG), harness side and ground.  A0091408 • **Is the voltage approximately 5 volts?**	**Yes** INSTALL a new pinch strip. TEST the system for normal operation. **No** GO to G3 .
G3 CHECK THE PINCH STRIP SIGNAL CIRCUIT FOR A SHORT TO GROUND • Key in OFF position. • Disconnect: PLG Module C4174B. • Measure the resistance between left pinch strip C4172-1, circuit CPR52 (YE/VT), harness side and ground; or between right pinch strip C4173-1, circuit CPR51 (YE/OG), harness side and ground.  A0091415 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G9 . **No** REPAIR the circuit. TEST the system for normal operation.
G4 CHECK THE DETENT AND FORKBOLT SWITCH PID • Enter the following diagnostic mode on the diagnostic tool: Primary Forkbolt, Secondary Forkbolt and Detent Switch PIDs. • **NOTE:** The liftgate is in the primary position when the liftgate is in the full closed position. The liftgate is in the UNLATCH position when the liftgate is open and completely out of the striker. The liftgate can be placed in the unlatched position by lifting up on the liftgate handle. • Begin with the liftgate in the open position, then slowly close the	**Yes** GO to G9 . **No** GO to G5 .

liftgate into each of the latch positions specified by the table below.

Liftgate Latch Position	Detent Switch PID	Secondary Forkbolt Switch PID	Primary Forkbolt Switch PID
Fully Unlatched	Not active [a]	Active	Active
In primary	Active	Not active	Not active

[a] If detent switch is active in the fully unlatched position, manually attempt to rotate the forkbolt towards the latched position.

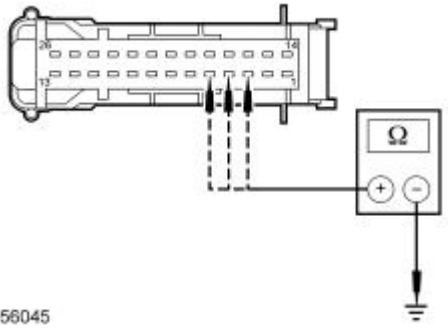
- **Do the switch states agree with the table?**

G5 CHECK THE OPERATION OF THE DETENT AND FORKBOLT SWITCHES

- Key in OFF position.
- Disconnect: PLG Module C4174B.
- Measure the resistance between PLG module C4174B, harness side and ground at each of the connector pins and each latch position specified by the table below.

Liftgate Latch Position	C4174B Circuit	Resistance
Fully Unlatched	Pin 3, circuit CPR66 (GY/YE)	Greater than 10,000 ohms [a]
Fully Unlatched	Pin 5, circuit CPR64 (VT/OG)	Less than 5 ohms
Fully Unlatched	Pin 4, circuit CPR65 (BU/GN)	Less than 5 ohms
Primary	Pin 3, circuit CPR66 (GY/YE)	Less than 5 ohms
Primary	Pin 5, circuit CPR64 (VT/OG)	Greater than 10,000 ohms
Primary	Pin 4, circuit CPR65 (BU/GN)	Greater than 10,000 ohms

[a] If resistance measured is less than 5 ohms, manually rotate the forkbolt to the latched position and re-test.



- **Do the resistance values agree with the table?**

Yes
GO to G9 .

No
GO to G6 .

G6 CHECK THE DETENT AND FORKBOLT SWITCH GROUND CIRCUIT

- Disconnect: Liftgate Latch/Unlatch Assembly C4339.
- Measure the resistance between PLG latch/unlatch assembly C4339-8, circuit GD149 (BK/GY), harness side and ground.

Yes
GO to G7 .

No

 N0056046 • **Is the resistance less than 5 ohms?**	REPAIR the circuit. TEST the system for normal operation.
G7 CHECK THE DETENT AND FORKBOLT SWITCH CIRCUITS FOR AN OPEN	
• Measure the resistance between PLG latch/unlatch assembly C4339, harness side and PLG module C4174B, harness side using the following table: **C4339 Pin** / **Circuit** / **C4174B Pin** 1 / CPR64 (VT/OG) / 5 3 / CPR65 (BU/GN) / 4 2 / CPR66 (GY/YE) / 3  N0056047 • **Is the resistance less than 5 ohms on all circuits?**	**Yes** GO to G8 . **No** REPAIR the circuit. TEST the system for normal operation.
G8 CHECK THE DETENT AND FORKBOLT SWITCH CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between PLG module C4174B-5, circuit CPR64 (VT/OG), harness side and ground; between PLG module C4174B-4, circuit CPR65 (BU/GN), harness side and ground; then between PLG module C4174B-3, circuit CPR66 (GY/YE), harness side and ground.  N0056045 • **Is the resistance greater than 10,000 ohms on all circuits?**	**Yes** CHECK the PLG latch connector for bent or corroded connections on the component side and harness side. REPAIR as necessary. INSTALL a new PLG latch. REFER to Section 501-14 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
G9 CHECK FOR CORRECT PLG MODULE OPERATION	

• Disconnect all the PLG module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all the PLG module connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PLG module. REFER to Power Liftgate Module in this section. REPEAT the PLG module self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the PLG module self-test.

Pinpoint Test H: The Power Liftgate Does Not Power Open (Power Close OK)

Refer to Wiring Diagrams Cell 109 , Power Liftgate for schematic and connector information.

Normal Operation

If the power liftgate (PLG) is in the closed position and the conditions are correct, the PLG module supplies 12 volts to the unlatch/cinching motor on circuit CPR62 (WH/BU), 12 volts to the clutch on circuit CPR69 (BN/BU) and 12 volts to the motor on circuit CPR57 (GN/WH). As the liftgate is moving in the open direction, the PLG module monitors the position sensor for door speed to detect obstacles. Once the liftgate is unlatched, the motor and clutch are activated to power open the liftgate.

Possible Causes

- Mechanical binding
- PLG latch
- PLG sector gear switches
- PLG module

PINPOINT TEST H: THE POWER LIFTGATE DOES NOT POWER OPEN (POWER CLOSE OK)

Test Step	Result / Action to Take
H1 CHECK THE MANUAL OPERATION OF THE LIFTGATE	
NOTE: If any other PLG related DTCs are present, diagnose those first before proceeding with this pinpoint test. Refer to the PLG Module Diagnostic Trouble Code (DTC) Chart. • Key in ON position. • Unlock all doors. • Turn the PLG OFF (disable) from the message center. • **NOTE:** A small amount of interference during a manual operation will be amplified during a power operation and may cause the liftgate to not power open. • Manually open and close the liftgate. • **Does the liftgate unlatch, open, close and latch correctly?**	**Yes** GO to H2 . **No** If liftgate does not unlatch correctly, REFER to Section 501-14 . If liftgate does not open and close correctly, REFER to Liftgate in this section.
H2 CHECK THE LIFTGATE LATCH AND STRIKER	

ALIGNMENT	
• **NOTE:** Make sure to inspect the underside of the striker bridge for witness marks. • Inspect the striker and latch for correct alignment. • **Is the latch and striker aligned correctly?**	**Yes** Go To Pinpoint Test A . **No** ALIGN the liftgate and striker. REFER to Liftgate in this section. TEST the system for normal operation.

Pinpoint Test I: Power Liftgate (PLG) DTC B117C — Latch Centering Switch Invalid

Refer to Wiring Diagrams Cell 109 , Power Liftgate for schematic and connector information.

Normal Operation

The power liftgate (PLG) module monitors the sector gear open switch, circuit CPR67 (VT) and sector gear close switch, CPR68 (YE) to determine the sector gear position.

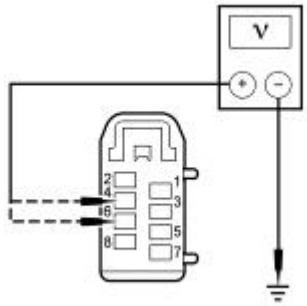
Possible Causes

- PLG diagnostic trouble code (DTC) B117C
- Open or short to ground in circuit CPR67 (VT) or CPR68 (YE)
- Short to voltage in circuit CPR67 (VT) or CPR68 (YE)
- PLG latch
- PLG module

PINPOINT TEST I: POWER LIFTGATE (PLG) DTC B117C — LATCH CENTERING SWITCH INVALID

Test Step	Result / Action to Take
I1 CHECK THE SECTOR GEAR SWITCH CIRCUITS	
NOTE: If any other PLG related DTCs are present, diagnose those first before proceeding with this pinpoint test. Refer to the PLG Module Diagnostic Trouble Code (DTC) Chart. • Disconnect: Latch/Unlatch Assembly C4339. • Key in ON position. • Measure the voltage between PLG latch/unlatch assembly C4339-4, circuit CPR67 (VT), harness side and ground; and between C4339-6, circuit CPR68 (YE), harness side and ground.  N0059427 • **Is the voltage greater than 10 volts for both measurements?**	**Yes** GO to I4 . **No** GO to I2 .
I2 CHECK CIRCUITS CPR67 (VT) AND CPR68 (YE) FOR SHORT TO GROUND	

• Key in OFF position. • Disconnect: PLG Module C4174B. • Measure the resistance between PLG module C4174B-15, circuit CPR67 (VT), harness side and ground; and between PLG module C4174B-26, circuit CPR68 (YE), harness side and ground.  N0056083 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I3 . **No** REPAIR the circuit. TEST the system for normal operation.
I3 CHECK CIRCUITS CPR67 (VT) AND CPR68 (YE) FOR AN OPEN	
• Measure the resistance between PLG module C4174B-15, circuit CPR67 (VT), harness side and PLG latch/unlatch assembly C4339-4, circuit CPR67 (VT), harness side; and between PLG module C4174B-26, circuit CPR68 (YE), harness side and PLG latch/unlatch assembly C4339-6, circuit CPR68 (YE), harness side.  N0056084 • **Is the resistance less than 5 ohms for both measurements?**	**Yes** CHECK the PLG module connector for bent or corroded connections on the component side and harness side. REPAIR as necessary. CLEAR the DTCs. REPEAT the PLG module self-test. IF DTC B117C returns, INSTALL a new PLG module. REFER to Power Liftgate Module in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
I4 CHECK CIRCUITS CPR67 (VT) AND CPR68 (YE) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: PLG Module C4174B. • Key in ON position. • Measure the voltage between PLG latch/unlatch assembly C4339-4, circuit CPR67 (VT), harness side and ground; and between C4339-6, circuit CPR68 (YE), harness side and ground.	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** CHECK the PLG latch connector for bent or corroded connections on the component side and harness side. REPAIR as necessary. INSTALL a new PLG



N0059427

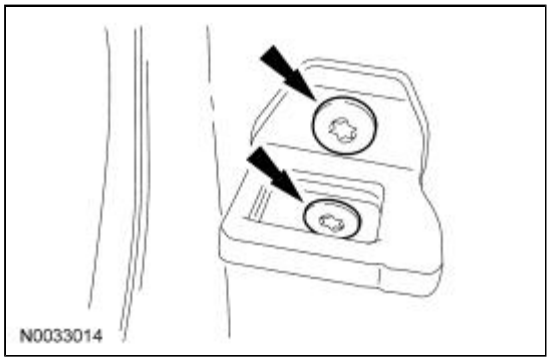
- **Is any voltage present for both measurements?**

latch. REFER to Section 501-14 . TEST the system for normal operation.

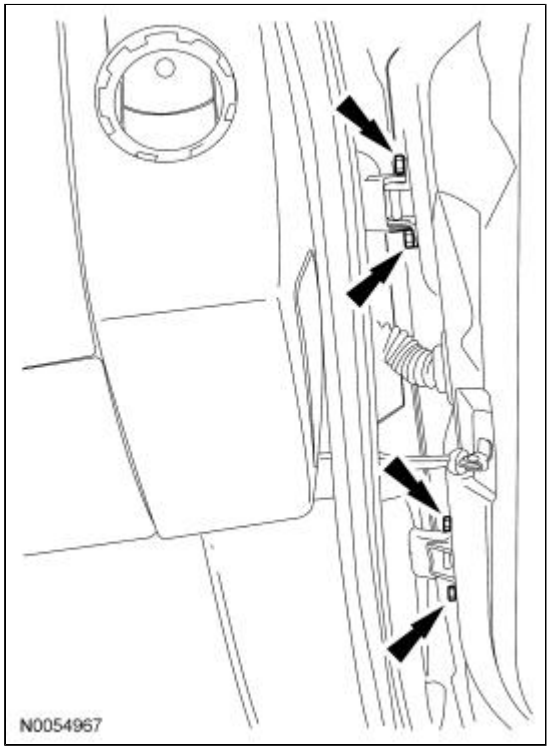
Hinge Adjustment — Front Door, Horizontal and Vertical

Printable View (125 KB)

1. Remove the 2 door striker bolts and the door striker.



2. Loosen the front door hinge-to-front door bolts enough to allow movement of the door.



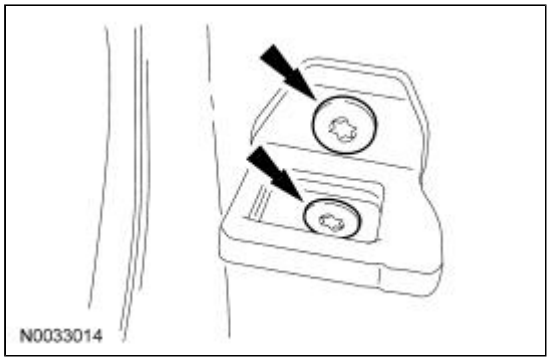
3. Adjust the front door.
4. Tighten the front door hinge-to-front door bolts to 30 Nm (22 lb-ft).
5. Install and adjust the door striker.
   - Tighten to 12 Nm (9 lb-ft).

Hinge Adjustment — Front Door, Fore and Aft

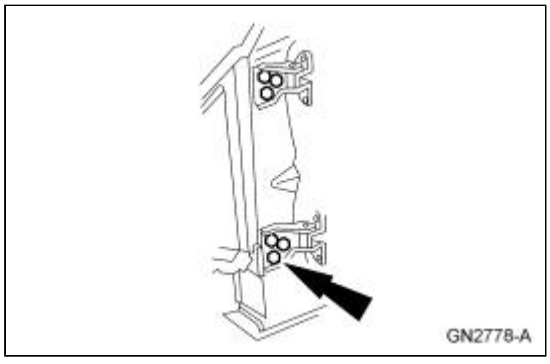
Printable View (104 KB)

NOTE: Check the rear door hinge adjustment before adjusting the front door hinge.

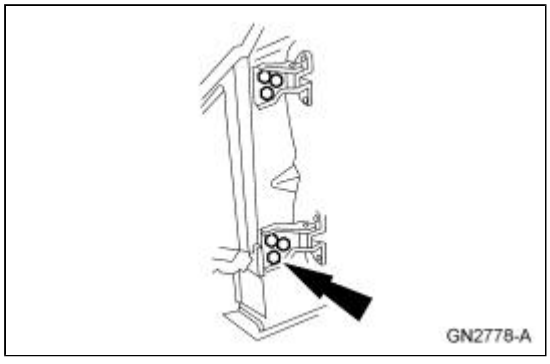
1. Remove the 2 door striker bolts and door striker.



2. Remove the front fender. For additional information, refer to Section 501-02 .
3. Loosen the front door hinge-to-body bolts.

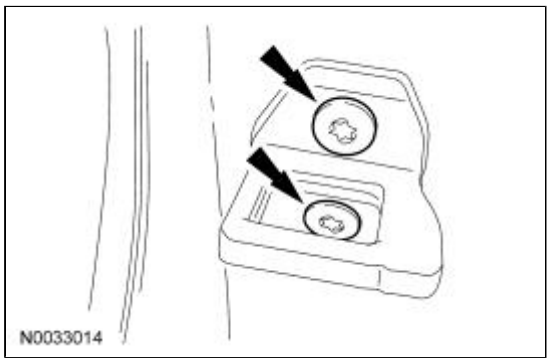


4. Adjust the front door alignment to specification.
5. Tighten the front door hinge-to-body bolts to 30 Nm (22 lb-ft).



6. Install the front fender. For additional information, refer to Section 501-02 .
7. Install and adjust the door striker.

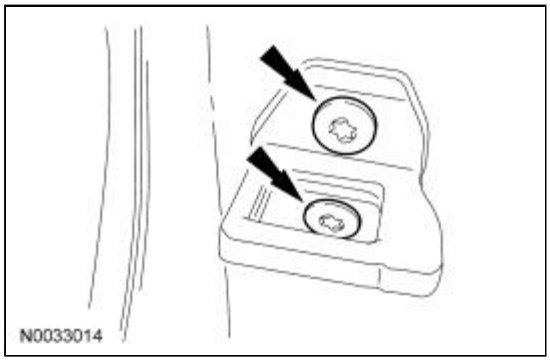
- Tighten to 12 Nm (9 lb-ft).



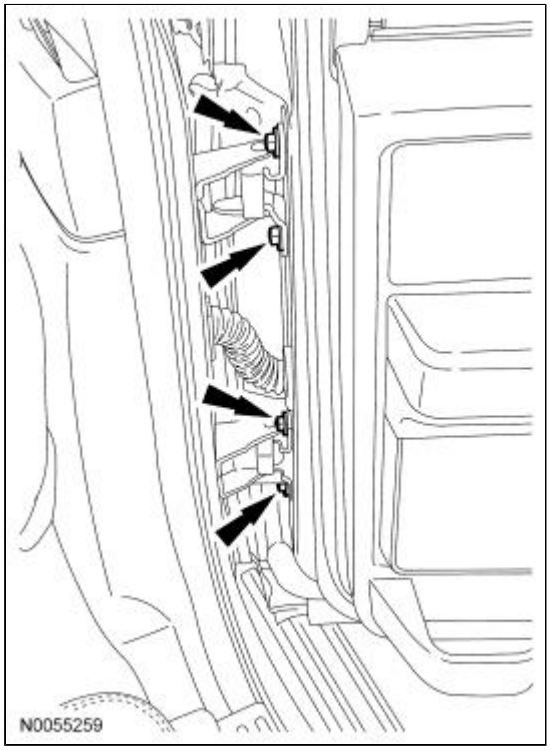
Hinge Adjustment — Rear Door, In, Out, Up and Down

Printable View (133 KB)

1. Remove the 2 door striker bolts and the door striker.



2. Loosen the rear door hinge-to-rear door bolts enough to allow movement of the door.

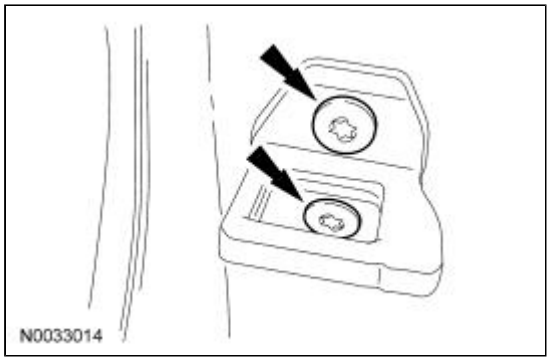


3. Adjust the rear door.
4. Tighten the rear door hinge-to-rear door bolts to 30 Nm (22 lb-ft).
5. Install and adjust the door striker.
   - Tighten to 12 Nm (9 lb-ft).

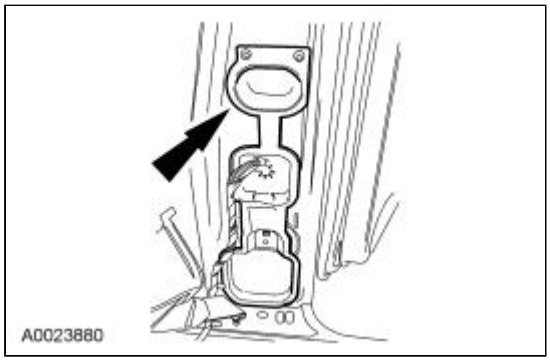
Hinge Adjustment — Rear Door, Fore, Aft and Tilt

Printable View (117 KB)

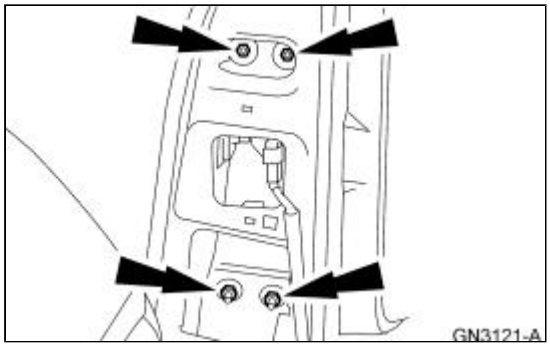
1. Position the front seat in the full forward position.
2. Remove the 2 door striker bolts and the door striker.



3. Remove the front seat belt retractor. For additional information, refer to Section 501-20A .
4. Remove the B-pillar weathershield.



5. Loosen the rear door hinge-to-B-pillar nuts enough to allow movement of the rear door.



6. Adjust the rear door.
7. Tighten the rear door hinge-to-B-pillar nuts to 30 Nm (22 lb-ft).
8. Install the B-pillar weathershield.

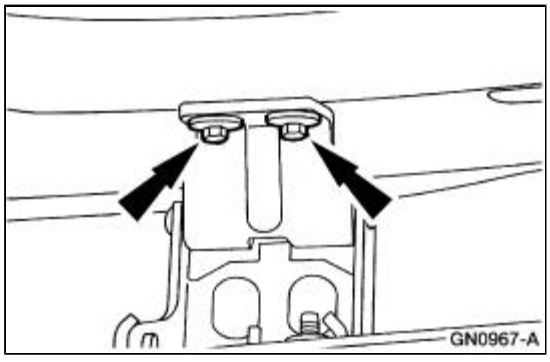
9. Install the front seat belt retractor. For additional information, refer to Section 501-20A .

10. Install and adjust the door striker.
    - Tighten to 12 Nm (9 lb-ft).

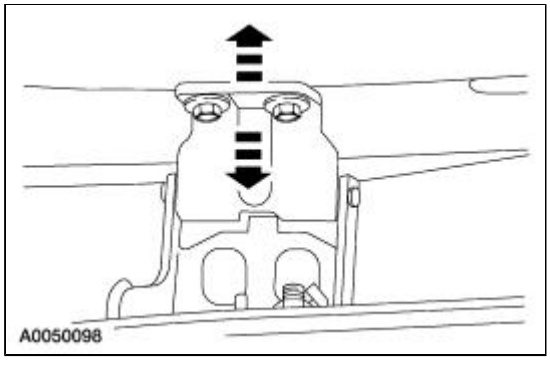
Hinge Adjustment — Liftgate

Printable View (98 KB)

1. Loosen the liftgate hinge to liftgate bolts.

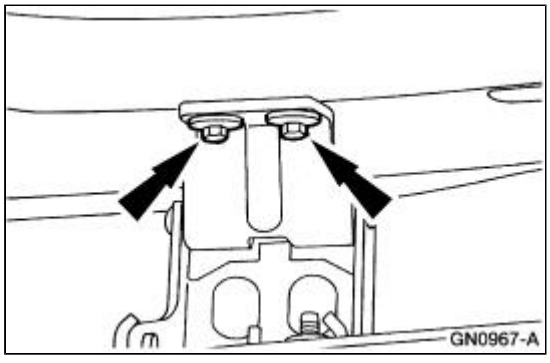


2. Adjust the liftgate alignment.



3. **NOTE:** The bolt washers must make full contact with the liftgate bracket when tightened.

   Tighten the liftgate hinge-to-liftgate bolts to 28 Nm (21 lb-ft).



Power Liftgate Initialization

Printable View (78 KB)

NOTE: If the power liftgate system is turned OFF in the message center, the system cannot be activated with any switches or with the liftgate handle. The system will need to be turned ON for any power operation to occur.

NOTE: The power liftgate may not operate under the following conditions:

- A low voltage or dead battery
- A disconnected battery

If any of these conditions has occurred, the power liftgate must be reset.

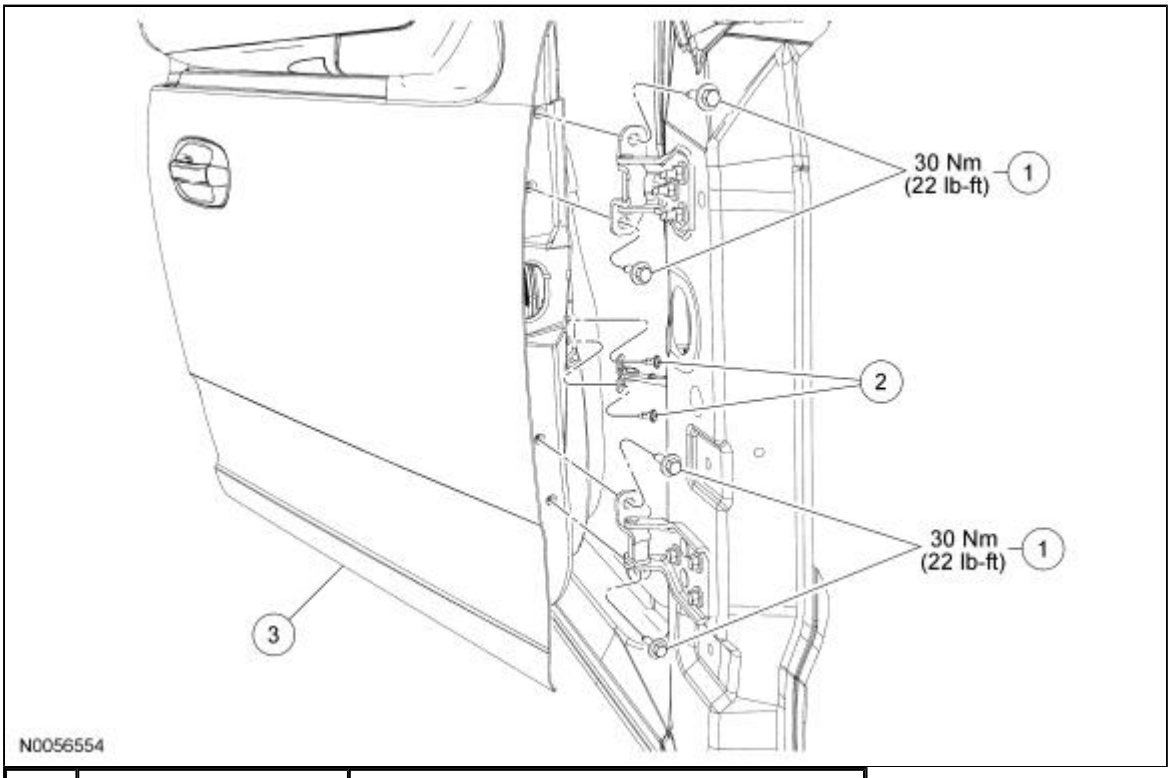
1. Manually close and fully latch the power liftgate.
2. **NOTE:** If the power liftgate does not open during this step, refer to the symptom chart to diagnose the power liftgate for no operation.

   Power open the power liftgate by using the key fob or control switch.
3. Once the power liftgate is fully open, close the power liftgate by using the key fob or control switch.

Door

Printable View (160 KB)

NOTE: Right front door shown, all other doors similar.



Item	Part Number	Description
1	N806738	Door hinge-to-door bolts (4 required)
2	W702788	Door check arm-to-door bolts (2 required)
3	20124 RH/ 20125 LH	Front door
3	24630 RH/ 24631 LH	Rear door

Removal and Installation

1. Remove the door speaker. For additional information, refer to Section 415-03 .
2. Partially remove and position aside the door weather shield.
3. Disconnect the electrical connectors.
   - Disconnect the window switch electrical connector.
   - Disconnect the door lock switch electrical connector.
   - Disconnect the door speaker electrical connector.
   - If equipped, disconnect the outside rearview mirror switch electrical connector.
4. Remove the wiring harness from the door.
5. If equipped, remove the 2 door check arm-to-door bolts.
6. **NOTE:** An assistant is necessary for the removal of the door.

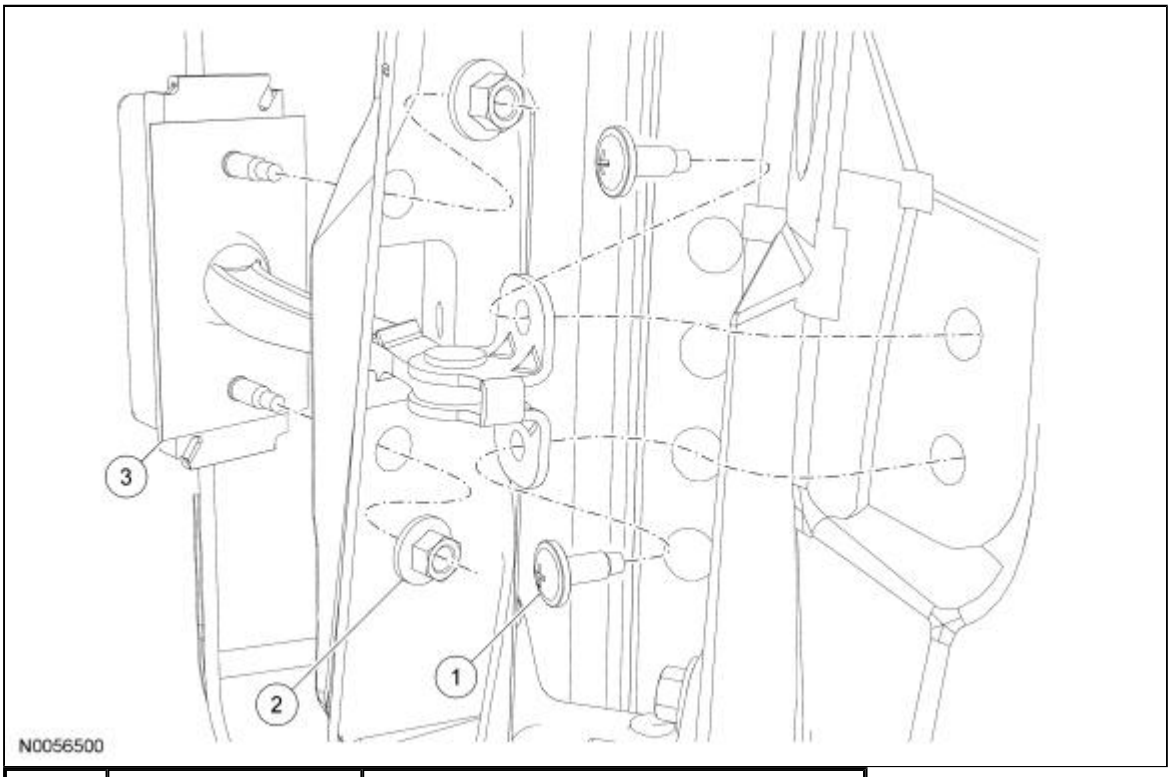
Remove the 4 door hinge-to-door bolts.

- To install, tighten to 30 Nm (22 lb-ft).

7. To install, reverse the removal procedure.

Door Check Arm

Printable View (194 KB)



Item	Part Number	Description
1	W702788	Door check arm-to-door bolt
2	—	Door check arm nut
3	23552	Door check arm

Left and right sides

1. Remove the lower cowl trim panel.
   - Remove the door scuff plate.

Left side

2. Remove the parking brake control assembly and position aside. For additional information, refer to Section 206-05 .

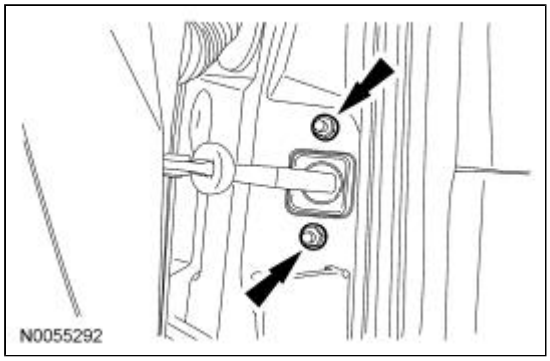
Left and right sides

3. Remove the lower cowl panel weather shield.

4. Remove the 2 door check arm-to-door bolts.

5. **NOTE:** Left side shown, right side similar.

   Remove the 2 door check arm nuts.



6. Remove the door check arm from the opening in the lower cowl panel.
7. To install, reverse the removal procedure.

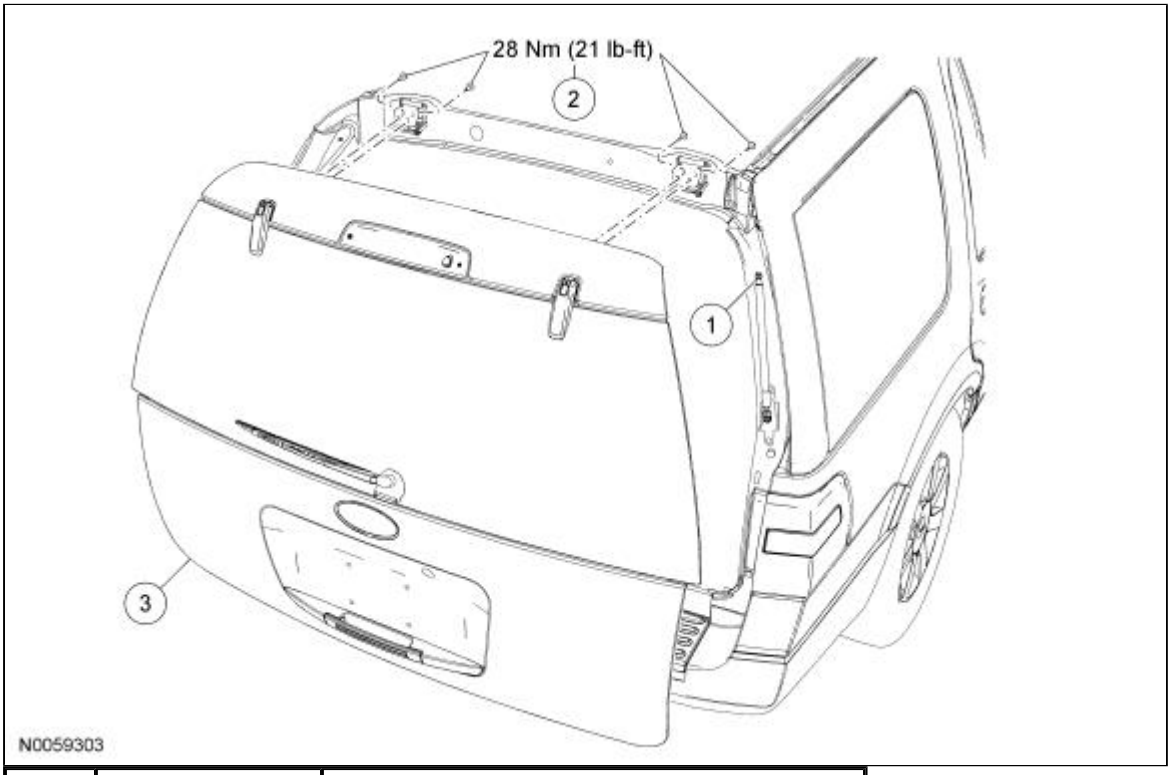
Liftgate

Printable View (304 KB)

Material

Item	Specification
Threadlock 262 TA-26	WSK-M2G351-A6

NOTE: Expedition shown, Navigator similar.



Item	Part Number	Description
1	406A10	Liftgate assist cylinder (2 required)
2	N807260	Liftgate hinge bolts (4 required)
3	40010	Liftgate assembly

All vehicles

1. Remove the D-pillar panels. For additional information, refer to Section 501-05 .

Vehicles with safety canopies

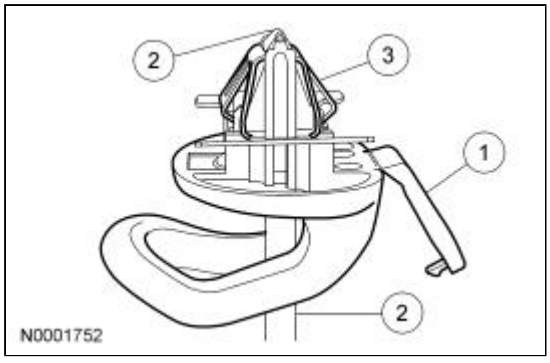
2. Remove the 2 rear garment hangers.
   - Open the access panel.
   - remove the garment hanger screws.

Vehicles without safety canopies

3. **CAUTION: To prevent damage to the garment hanger retainer, use a 3/16-inch flat blade screwdriver for this step.**

   NOTE: The garment hanger is shown without the roof sheet metal to show the metal retainer clip. The metal retainer clip will remain engaged in the sheet metal after the garment hanger is removed.

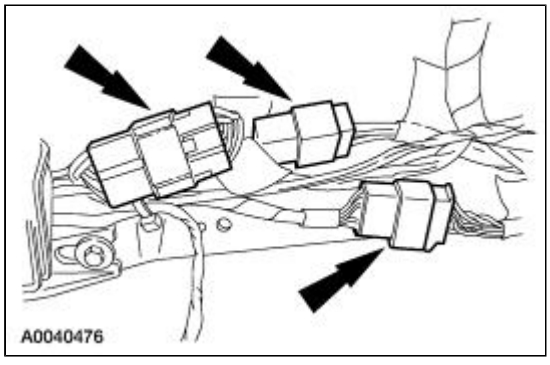
   Remove the 2 rear garment hangers.
   1. Open the access cover.
   2. Insert the flat-blade screwdriver fully into the garment slot.
   3. Rotate the screwdriver 90 degrees so that the screwdriver spreads the metal retainer clip. Remove the plastic garment hanger.



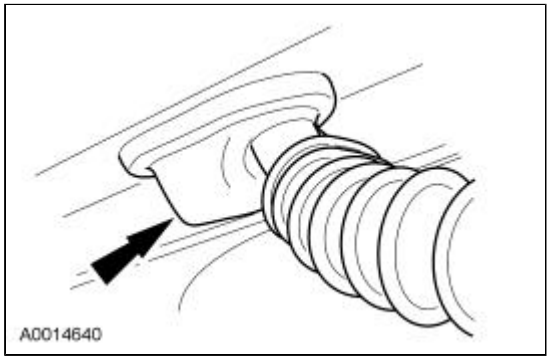
All vehicles

4. Remove the headliner rear pin-type retainers and partially lower the rear of the headliner.

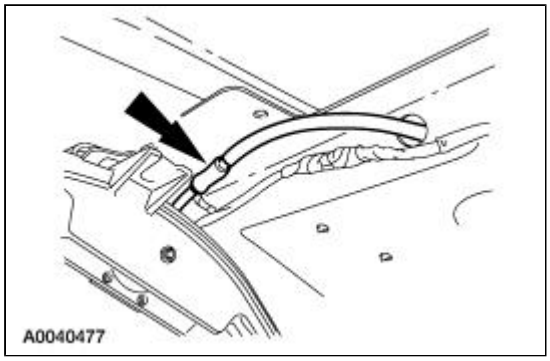
5. Disconnect the liftgate electrical connectors.



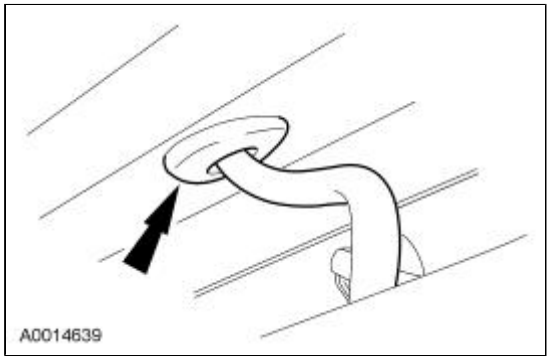
6. Remove the wire harness grommet and route the wire harness out from the roof.



7. Disconnect the rear washer tube.

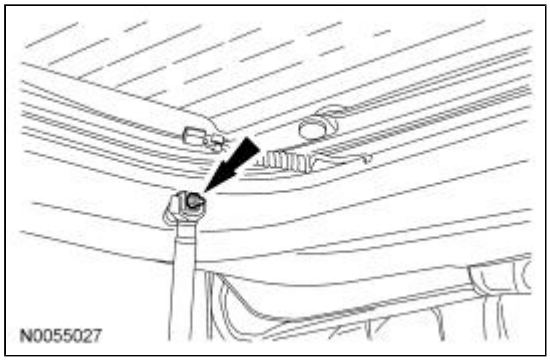


8. Remove the rear washer tube grommet and route the rear washer tube out from the roof.



Vehicles with power liftgate

9. Remove the power liftgate rod-to-liftgate cover and nut.
    - To install, tighten to 11 Nm (8 lb-ft).



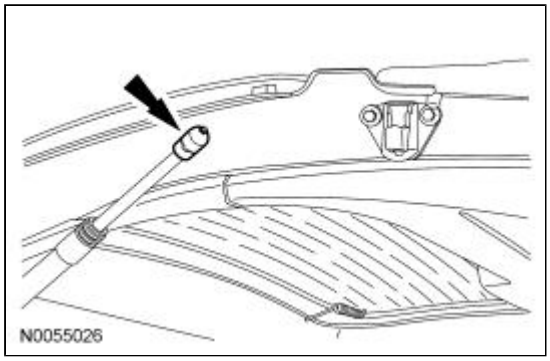
10. Remove the power liftgate rod from the liftgate.
    - To install, apply Threadlock 262 to the threads of fastener and tighten to 11 Nm (8 lb-ft).

All vehicles

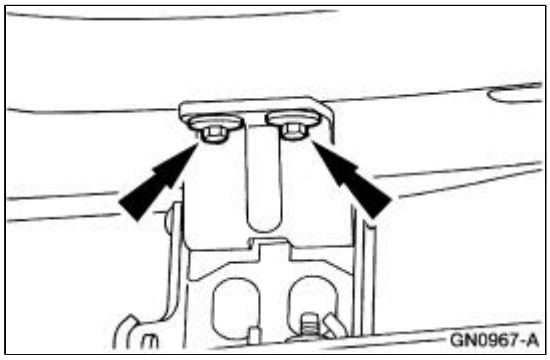
11. **NOTE:** Left side shown, right side similar.

    NOTE: An assistant is necessary for the removal of the liftgate.

    Disconnect the assist cylinders at the side of the liftgate.



12. Remove the 4 liftgate hinge bolts and remove the liftgate.
    - To install, tighten to 28 Nm (21 lb-ft).

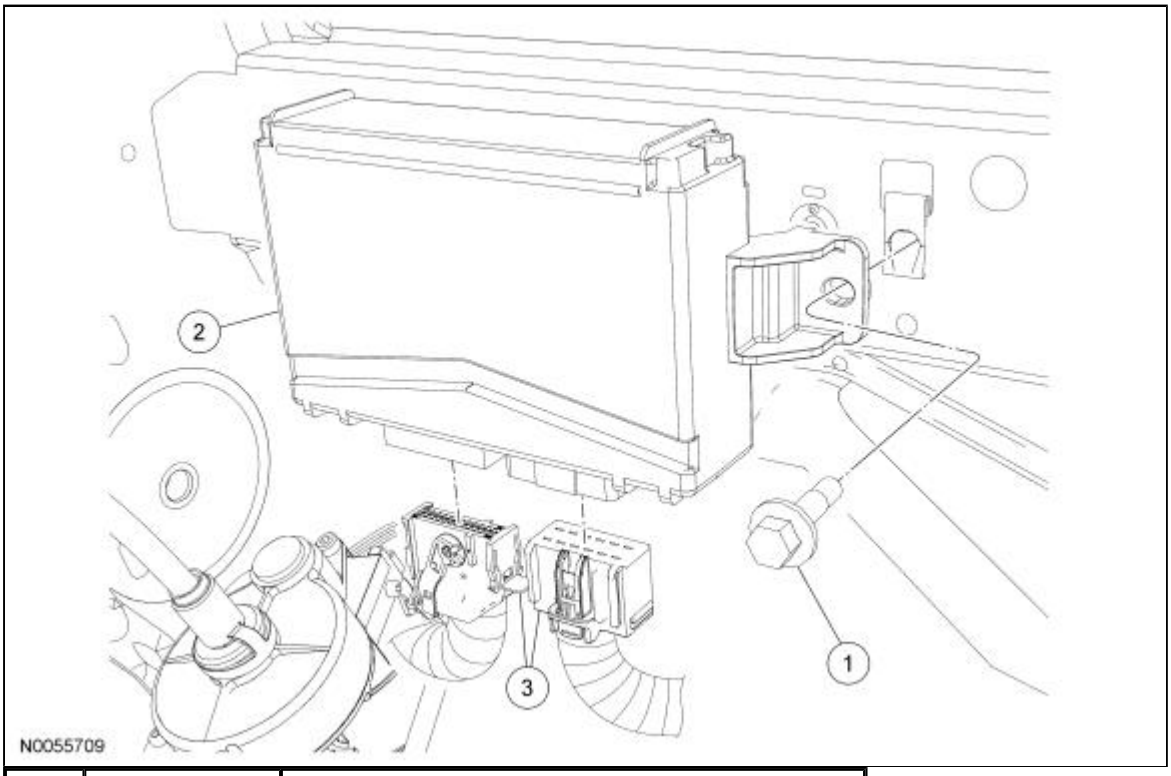


13. To install, reverse the removal procedure.
    - If equipped with power liftgate, initialize the power liftgate system. Refer to Power Liftgate Initialization in this section.

Power Liftgate Module

Printable View (180 KB)

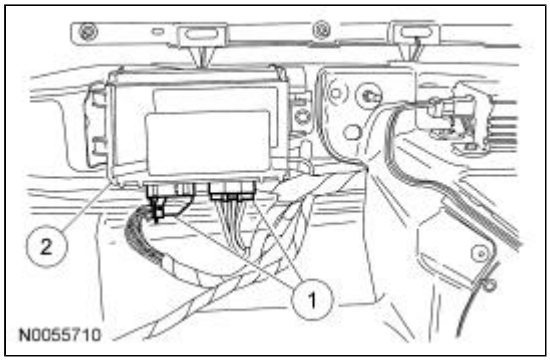
Removal and Installation



Item	Part Number	Description
1	W506013	Power liftgate module retaining bolt
2	404D06	Power liftgate module
3	—	Power liftgate module electrical connectors

1. Remove the rear quarter trim panel. For additional information, refer to Section 501-05 .

2. Remove the power liftgate module.
   1. Disconnect the electrical connectors.
   2. Remove the bolt.
      - To install, tighten to 9 Nm (80 lb-in).



3. To install, reverse the removal procedure.

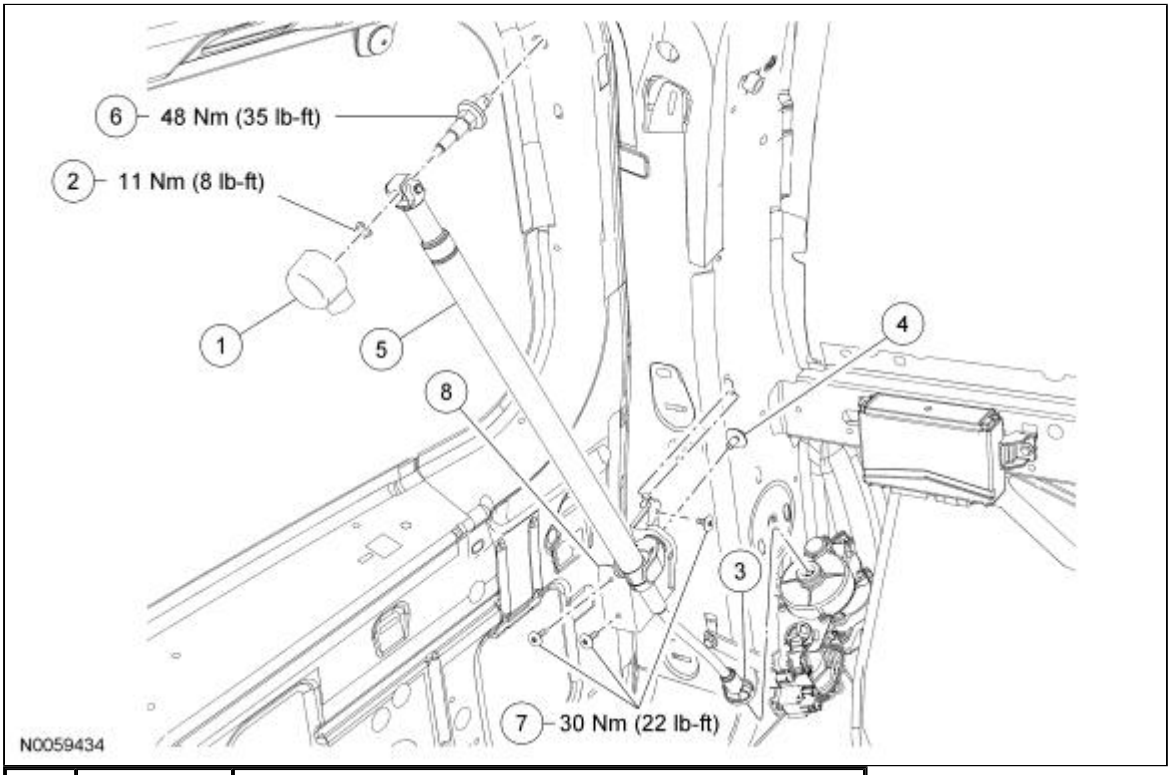
Power Liftgate Rod

Printable View (222 KB)

Material

Item	Specification
Threadlock 262 TA-26	WSK-M2G351-A6

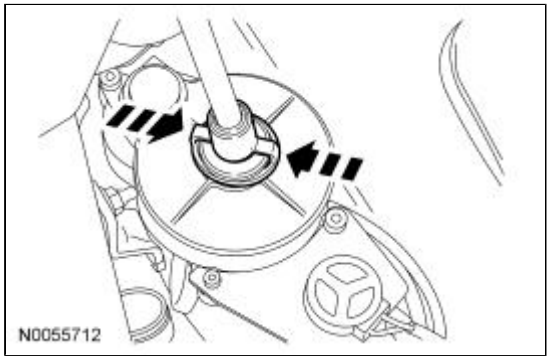
Removal and Installation



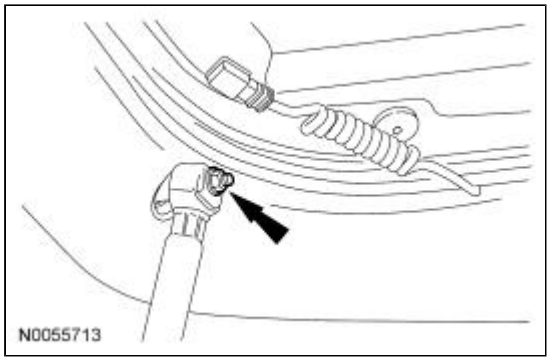
Item	Part Number	Description
1	410B00	Power liftgate rod end cover
2	W520412	Power liftgate rod-to-liftgate retaining nut
3	—	Power liftgate rod-to-motor retaining clip (part of the power liftgate rod assembly)
4	—	Power liftgate rod-to-bracket bolt
5	404B45	Power liftgate rod assembly
6	404E48	Power liftgate rod mounting stud
7	—	Power liftgate rod bracket-to-pillar bolts (3 required)
8	—	Power liftgate rod bracket (PIA)

1. Remove the LH quarter trim panel. For additional information, refer to Section 501-05 .
2. Unclip the power liftgate rod from the motor assembly.

- Squeeze the clip as shown to release and position upward on the rod assembly.



3. Remove the cover and the power liftgate rod-to-liftgate retaining nut.
    - To install, apply Threadlock 262 to the threads of fastener and tighten to 11 Nm (8 lb-ft).



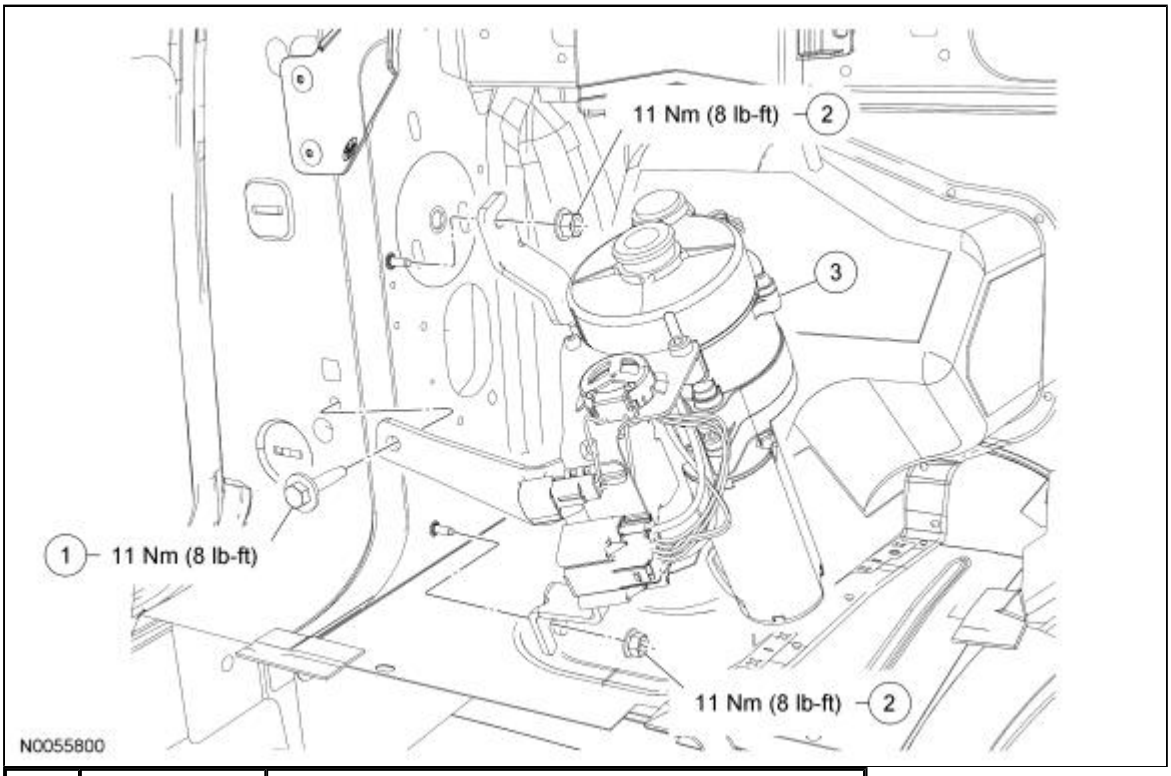
4. Remove the power liftgate rod-to-bracket bolt and the power liftgate rod assembly.

5. To install, reverse the removal procedure.

Power Liftgate Motor

Printable View (240 KB)

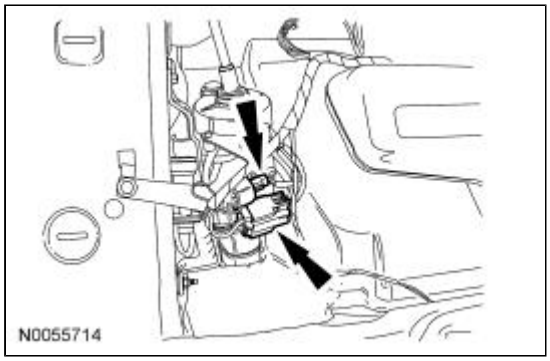
Removal and Installation



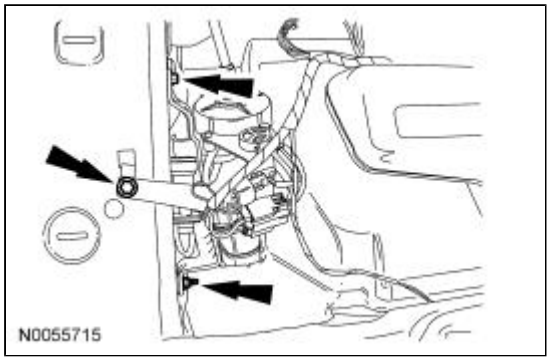
Item	Part Number	Description
1	W505425	Power liftgate motor retaining bolt
2	W520111	Power liftgate motor retaining nuts (2 required)
3	404C85	Power liftgate motor assembly

1. Remove the power liftgate rod assembly. For additional information, refer to Power Liftgate Rod in this section.

2. Disconnect the power liftgate motor electrical connectors.



3. Remove the power liftgate retaining fasteners and the power liftgate motor assembly.
   - To install, tighten to 11 Nm (8 lb-ft).

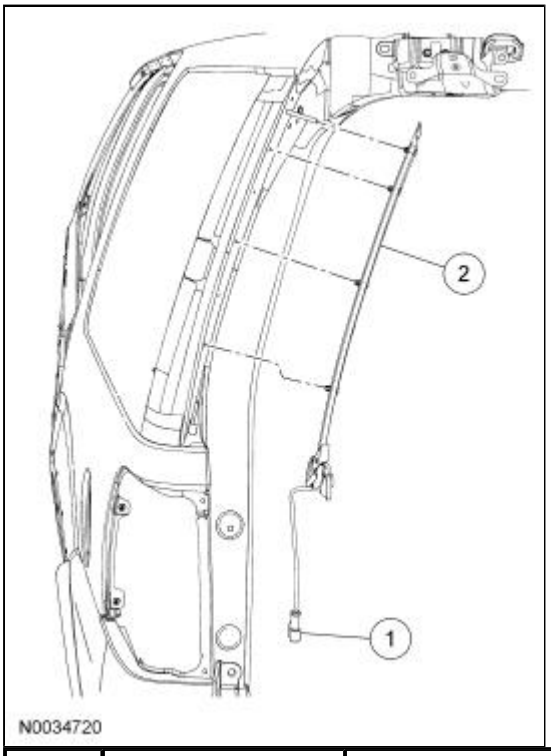


4. To install, reverse the removal procedure.

Pinch Strip Switch

Printable View (200 KB)

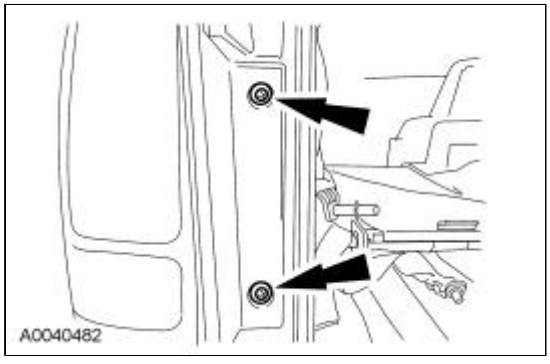
Removal and Installation



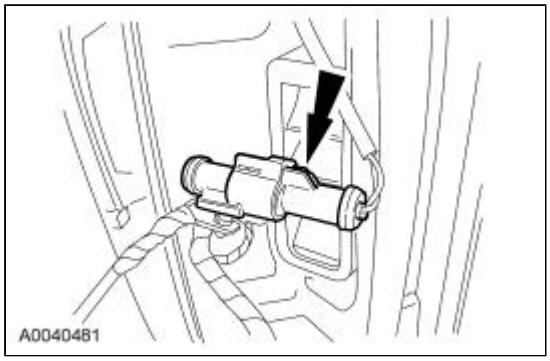
Item	Part Number	Description
1	—	Pinch strip electrical connector
2	42430B	Pinch strip

NOTE: Left side shown, right side similar.

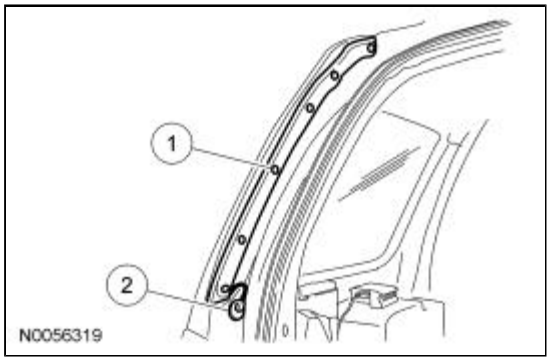
1. Remove brake light.
   - Remove the screws.



2. Disconnect the pinch strip electrical connector.



3. Remove the pinch strip.
    1. Remove the pin-type retainers.
    2. Remove the grommet and route the harness out of the vehicle.



4. To install, reverse the removal procedure.

Printable View (63 KB)

1. For additional information, refer to the procedures in this section.

A-Pillar Trim Panel

Printable View (78 KB)

Removal and Installation

1. Remove the 2 front assist handle bolt covers.
2. Remove the 2 assist handle bolts.
   - To install, tighten to 5 Nm (44 lb-in).
3. **NOTE:** Carefully rotate the A-pillar trim panel during this step.

   Pry the A-pillar trim panel to remove.
4. To install, reverse the removal procedure.

B-Pillar Trim Panel

Printable View (176 KB)

Removal and Installation

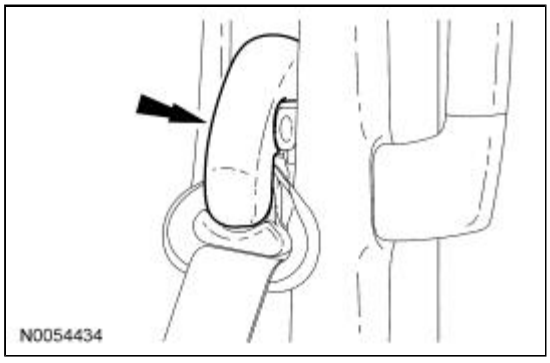
Upper and lower

1. Move the front seat to the full forward position.

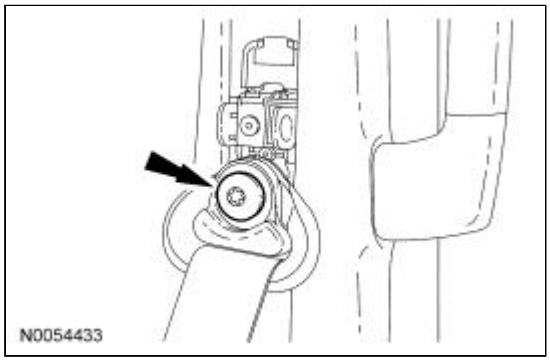
2. **NOTE:** Position the shoulder safety belt guide to the lowest position.

   NOTE: Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or the cover does not remain closed, install a new shoulder safety belt guide cover.

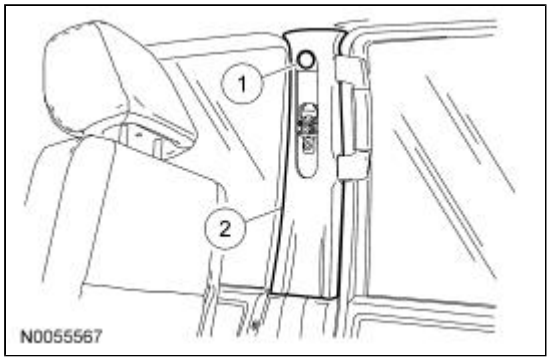
   Remove the shoulder safety belt guide cover.
   - Detach the top of the shoulder safety belt guide cover.
   - Rotate the shoulder safety belt guide cover 90 degrees and remove from the safety belt guide bolt.



3. Remove the shoulder safety belt guide.
   - Remove the shoulder safety belt guide bolt.
     - To install, tighten to 40 Nm (30 lb-ft).
   - Remove the shoulder safety belt guide.



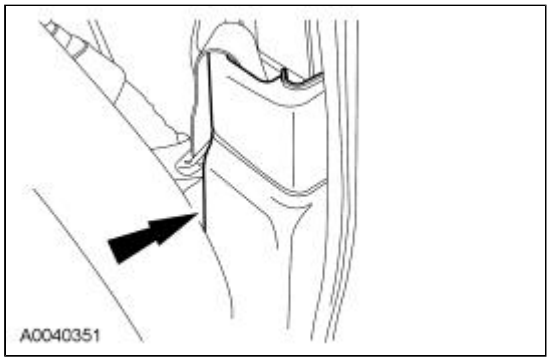
4. Remove the upper B-pillar trim panel.
   1. Remove the bolt cover and bolt.
      - To install, tighten to 8 Nm (71 lb-in).
   2. Remove the upper B-pillar trim panel by pulling outward to release the clips.



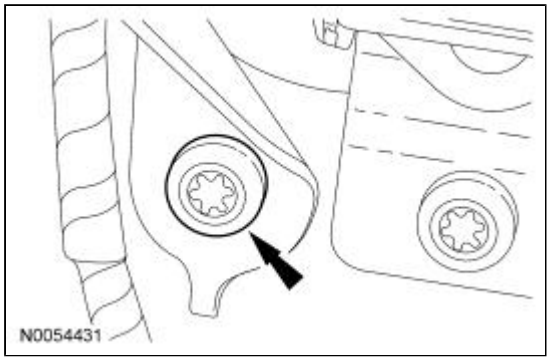
Lower

5. Remove the front and rear door scuff plates.

6. Position the lower B-pillar trim panel aside.



7. Remove the front safety belt anchor bolt.
    - To install, tighten to 40 Nm (30 lb-ft).



8. Feed the safety belt through the lower B-pillar trim panel and remove.

Upper and lower

9. To install, reverse the removal procedure.
    - When installing the upper B-pillar trim panel, insert the safety belt guide slide into the upper B-pillar trim panel.

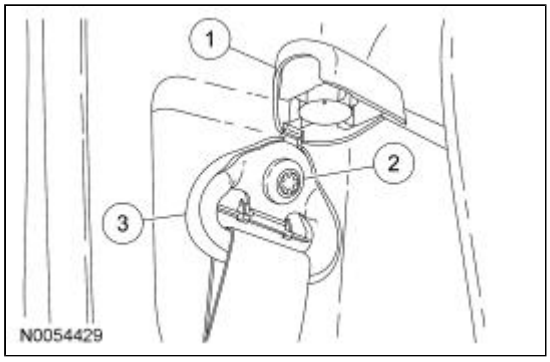
C-Pillar Trim Panel

Printable View (132 KB)

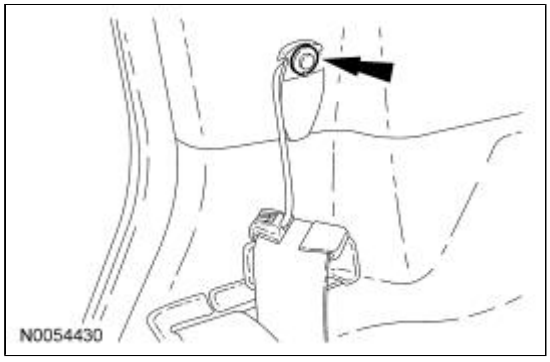
All vehicles

1. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or the cover does not remain closed, install a new shoulder safety belt guide cover.

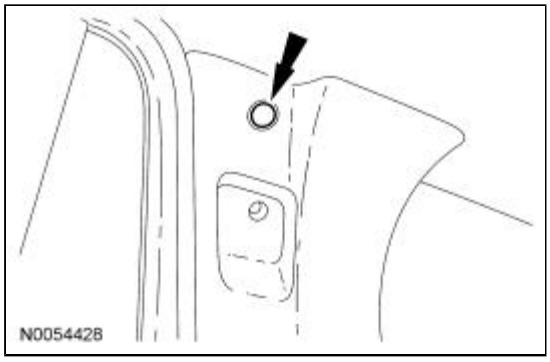
   Remove the shoulder safety belt guide.
   1. Position the shoulder safety belt cover up.
   2. Remove the safety belt guide bolt.
      - To install, tighten to 40 Nm (30 lb-ft).
   3. Remove the shoulder safety belt guide.



2. Detach the safety belt holder pin-type retainer.



3. Remove the C-pillar trim panel fastener cover.



Expedition EL/Navigator L only

4. Remove the C-pillar trim panel nut.
    - To install, tighten to 8 Nm (71 lb-in).

All vehicles except Expedition EL

5. Remove the C-pillar trim panel bolt.
    - To install, tighten to 8 Nm (71 lb-in).

All vehicles

6. Remove the C-pillar trim panel.
    - Remove the C-pillar trim panel by pulling outward to release the retainers.

7. To install, reverse the removal procedure.

D-Pillar Trim Panel

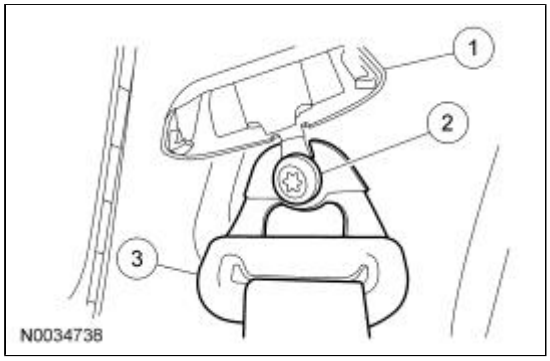
Printable View (137 KB)

All vehicles except Expedition EL/Navigator L

NOTE: Right side with power vent windows shown, all others similar.

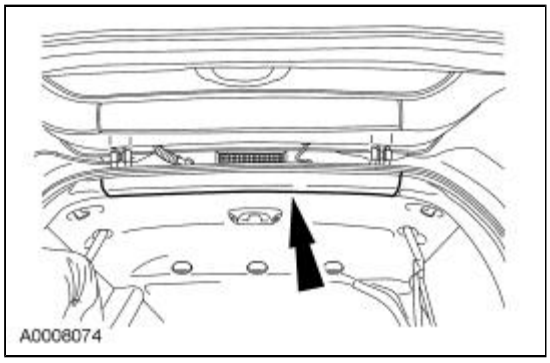
1. **NOTE:** Inspect the shoulder safety belt guide cover for damage. If the shoulder safety belt guide cover is damaged or cover does not remain closed, install a new shoulder safety belt guide cover.

   Remove the shoulder safety belt guide.
   1. Position the shoulder safety guide cover up.
   2. Remove the shoulder safety belt guide bolt.
      - To install, tighten to 40 Nm (30 lb-ft).
   3. Remove the shoulder safety belt guide.

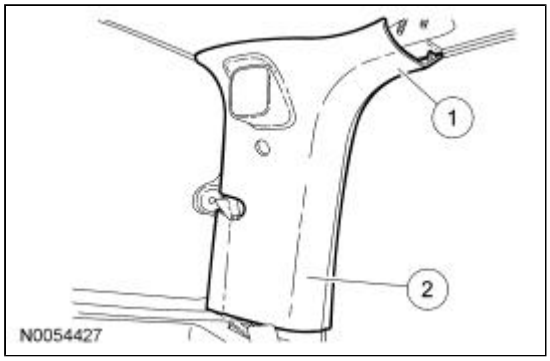


All vehicles

2. Remove rear upper headliner trim panel.



3. Remove the D-pillar trim panel.
   1. Disengage the upper clip by pulling downward.
   2. Unseat the D-pillar trim panel and rotate forward to remove.
   - If equipped, disconnect the speaker electrical connector.

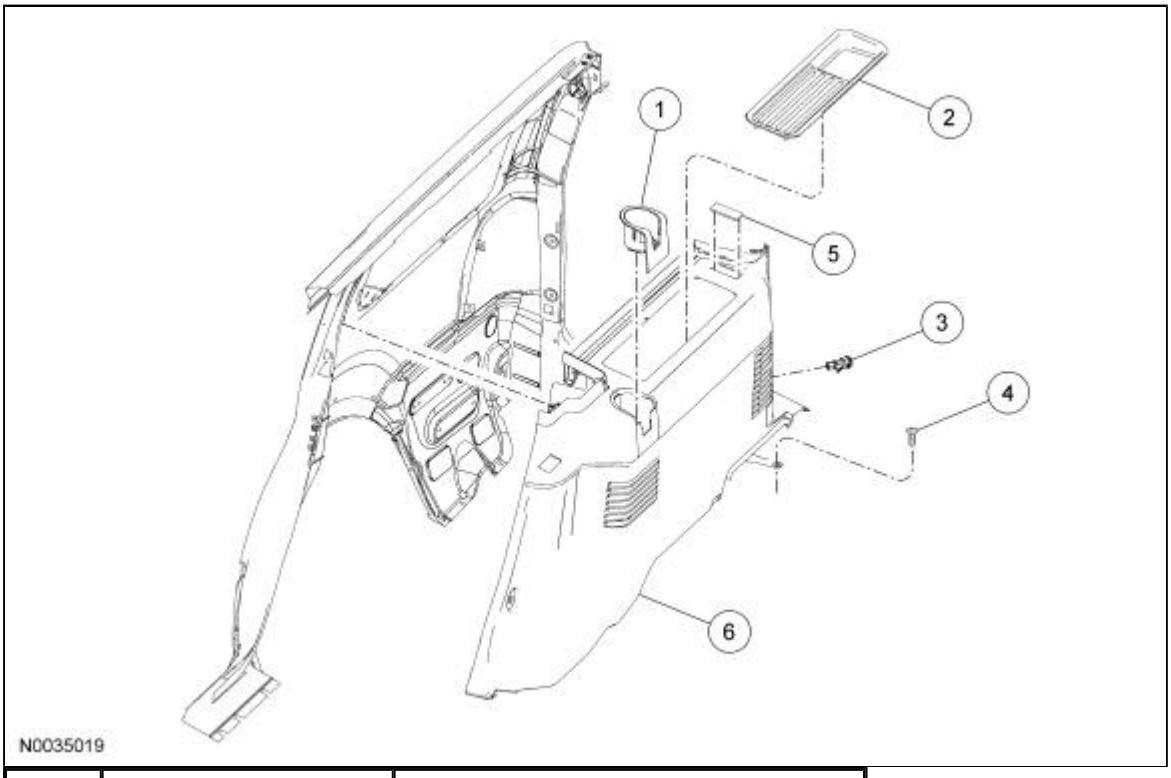


4. To install, reverse the removal procedure.

Quarter Trim Panel

Printable View (439 KB)

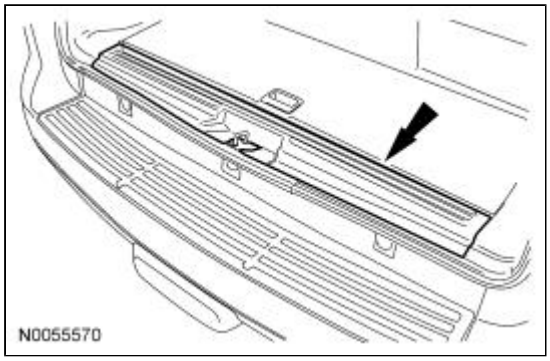
NOTE: Navigator shown, Expedition and Expedition EL/Navigator L similar.



Item	Part Number	Description
1	13560A	Cup holder
2	13530A	Utility tray
3	19N236B	Auxiliary power point socket
4	—	Pin-type retainer
5	601B32	Cover
6	31012A/ 31012B	Rear quarter trim panel

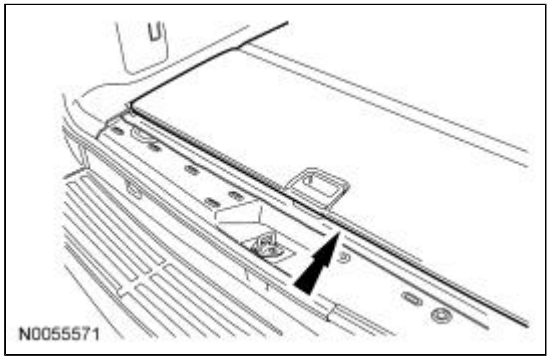
All vehicles

1. Remove the C-pillar trim panel. For additional information, refer to C-Pillar Trim Panel in this section.
2. Remove the D-pillar trim panel. For additional information, refer to D-Pillar Trim Panel in this section.
3. Remove the liftgate scuff plate by pulling upward.



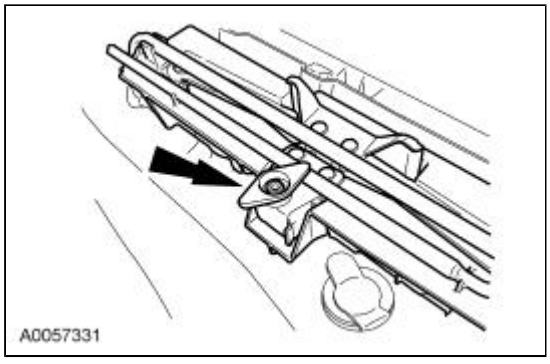
All vehicles except Expedition EL/Navigator L

4. Remove the rear floor cargo space trim panel.



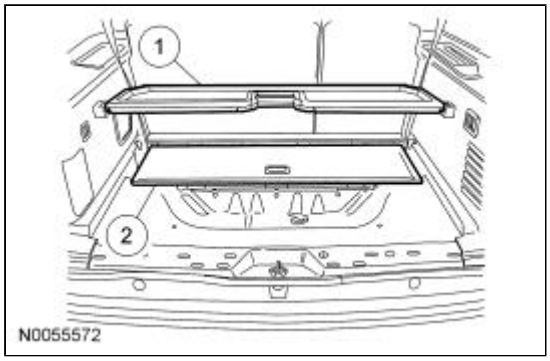
All vehicles

5. Remove the floor jack assembly.



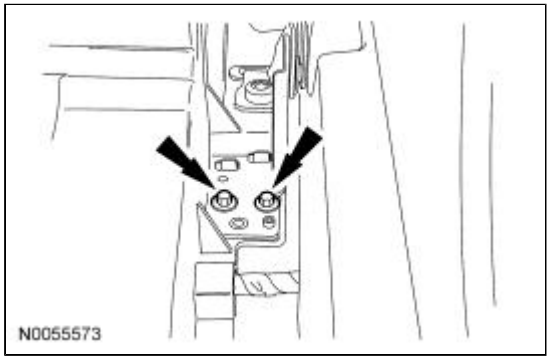
Expedition EL/Navigator L

6. Remove the cargo space trim panel.
    1. Move the cargo shelf to the upright position.
    2. Remove the cargo space trim panel.



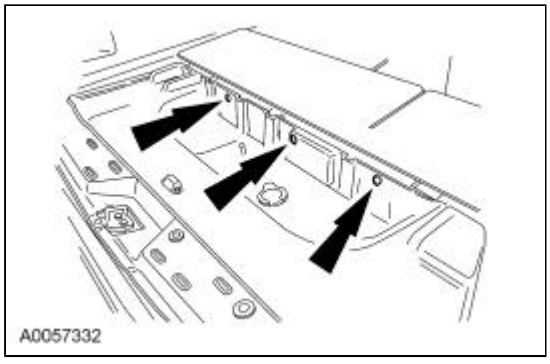
7. **NOTE:** RH cargo shelf bracket shown, LH similar.

   Remove the 4 cargo shelf bracket bolts.

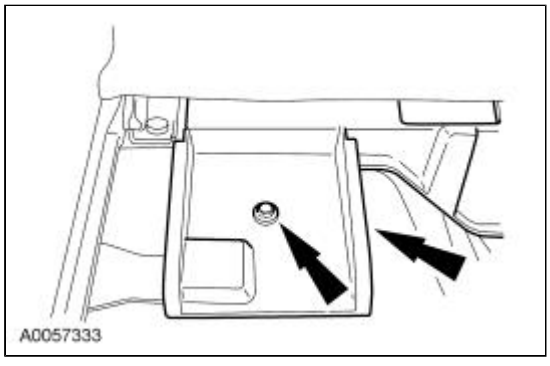


All vehicles

8. Remove the pin-type retainers and pull back the carpeting.

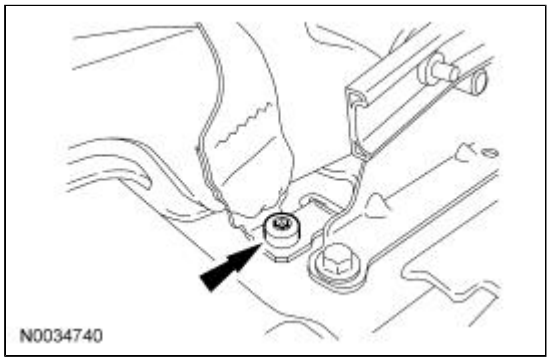


9. Remove the 2 bolts and the cargo space panel by pulling upward.



All vehicles except Expedition EL/Navigator L

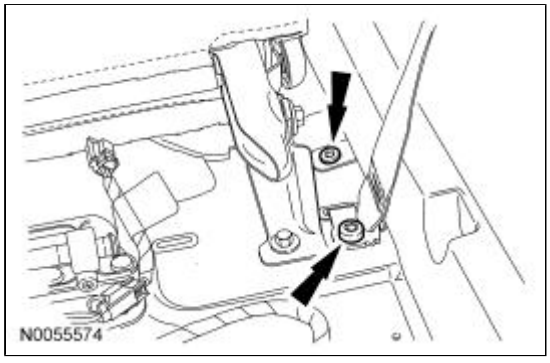
10. Remove the third row seat safety belt anchor bolt.
    - To install, tighten to 40 Nm (30 lb-ft).



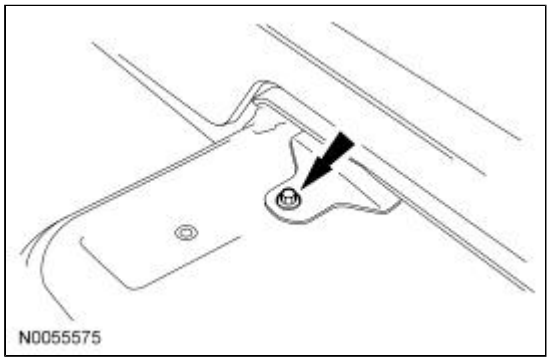
11. Remove the rear quarter trim panel pin-type retainer.

Expedition EL/Navigator L

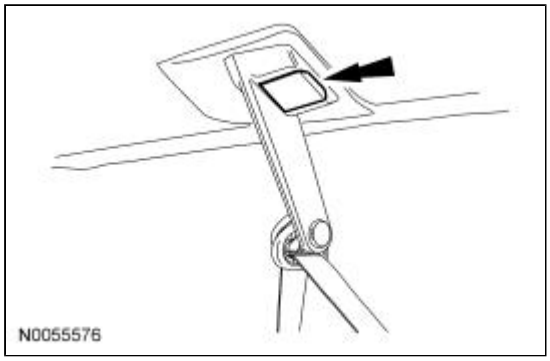
12. Remove the third row seat safety belt anchor and scrivet.
    - To install, tighten to 40 Nm (30 lb-ft).



13. Remove the rear quarter trim panel bolt.

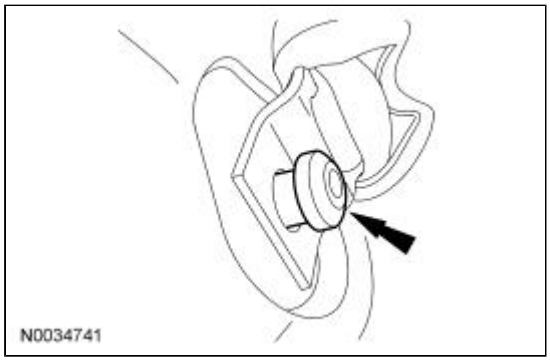


14. Open the third row seat safety belt guide bolt cover and remove the safety belt guide bolt.
    - To install, tighten to 40 Nm (30 lb-ft).

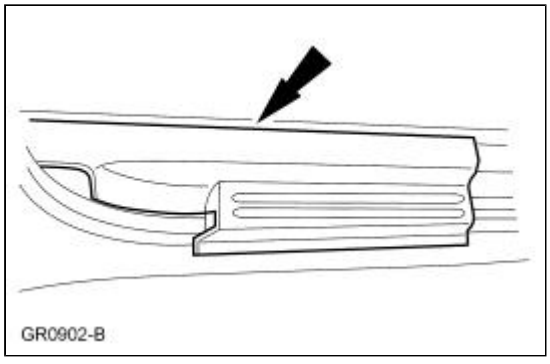


All vehicles

15. Remove the second row safety belt anchor.
    - To install, tighten to 40 Nm (30 lb-ft).

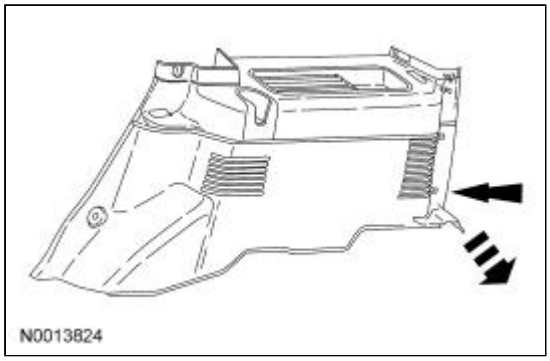


16. Remove the rear door scuff plate by pulling upward.



17. Fold the seat back of the third row seat to the full down position.

18. Remove the rear quarter trim panel.
    - Disengage the rear clip on the base of the trim panel first, by pulling the bottom rear edge toward the center of the vehicle.
    - Disengage the remaining clips.
    - If equipped, disconnect the power point, power liftgate switch or the power third row seat switch electrical connector at the rear.

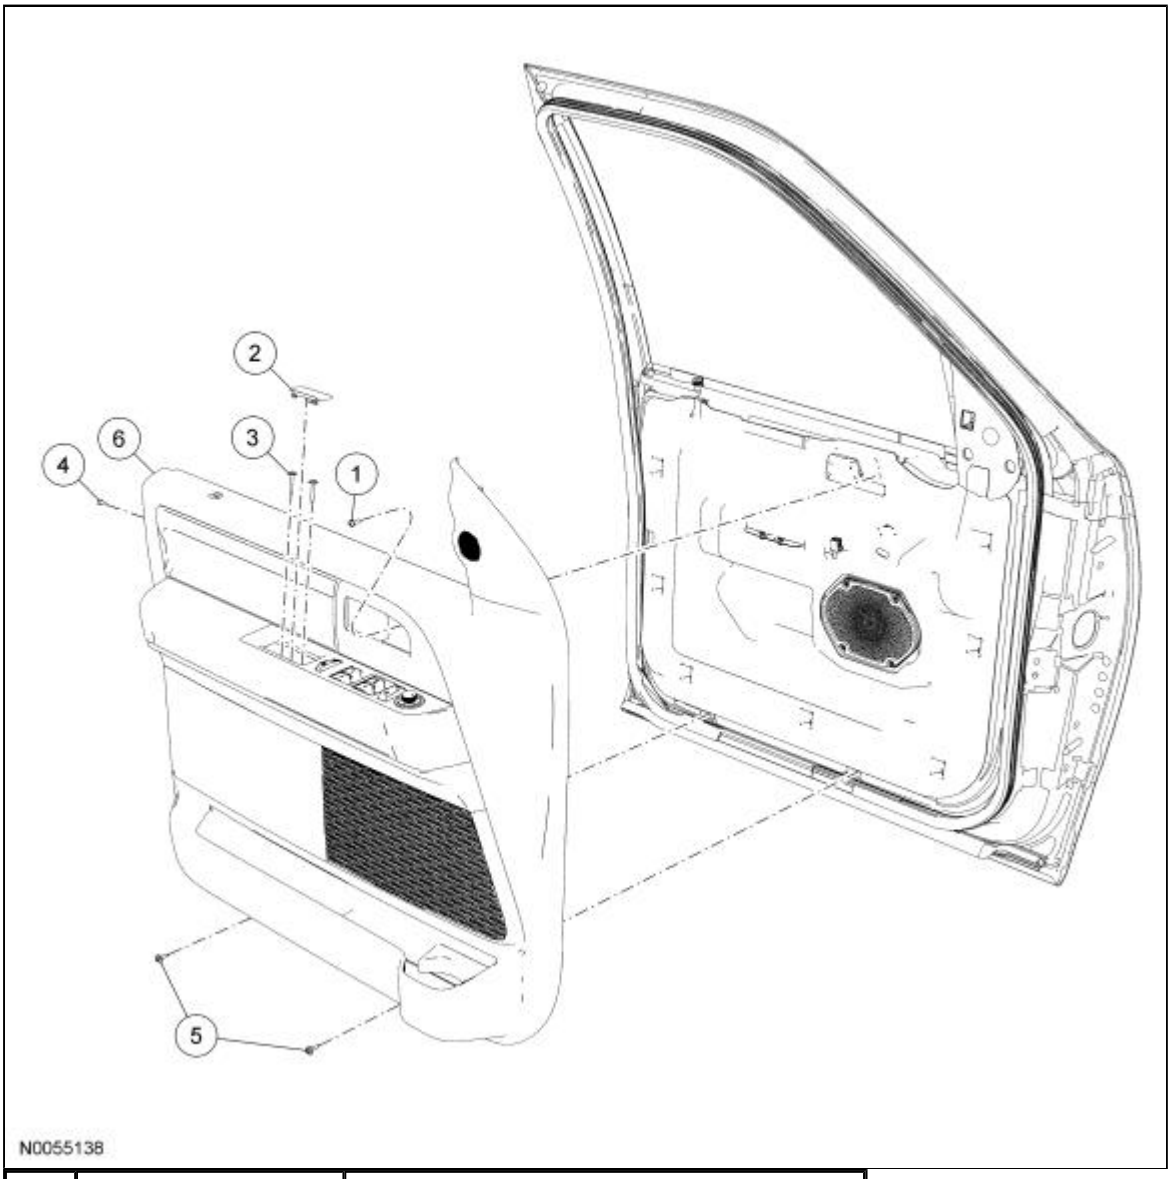


19. To install, reverse the removal procedure.

Door Trim Panel — Front

Printable View (240 KB)

NOTE: Expedition shown, Navigator similar.

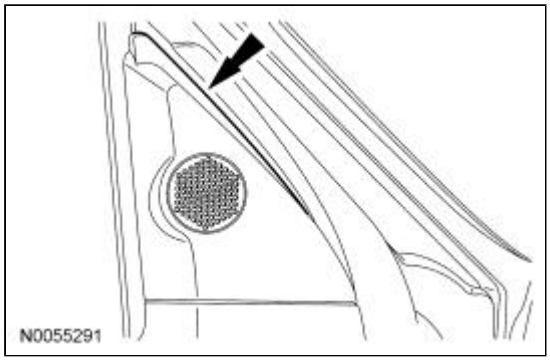


Item	Part Number	Description
1	W505156	Door handle screw
2	237W10	Front door trim panel finish cover
3	W505156	Door trim panel armrest screw (2 required)
4	W708412	Door trim panel screw
5	W708392	Lower door trim panel screws (2 required)
6	23942 RH/ 23943 LH	Front door trim panel

Removal and Installation

NOTE: Left front door shown, right front door similar.

1. Remove the door handle screw cover.
    - Use the service notch.
2. Remove the door handle screw.
3. Remove the front door trim panel finish cover.
4. Remove the 2 door trim panel screws.
5. Remove the door trim panel screw.
6. Remove the 2 lower door trim panel screws.
7. Disengage the sail panel clip.



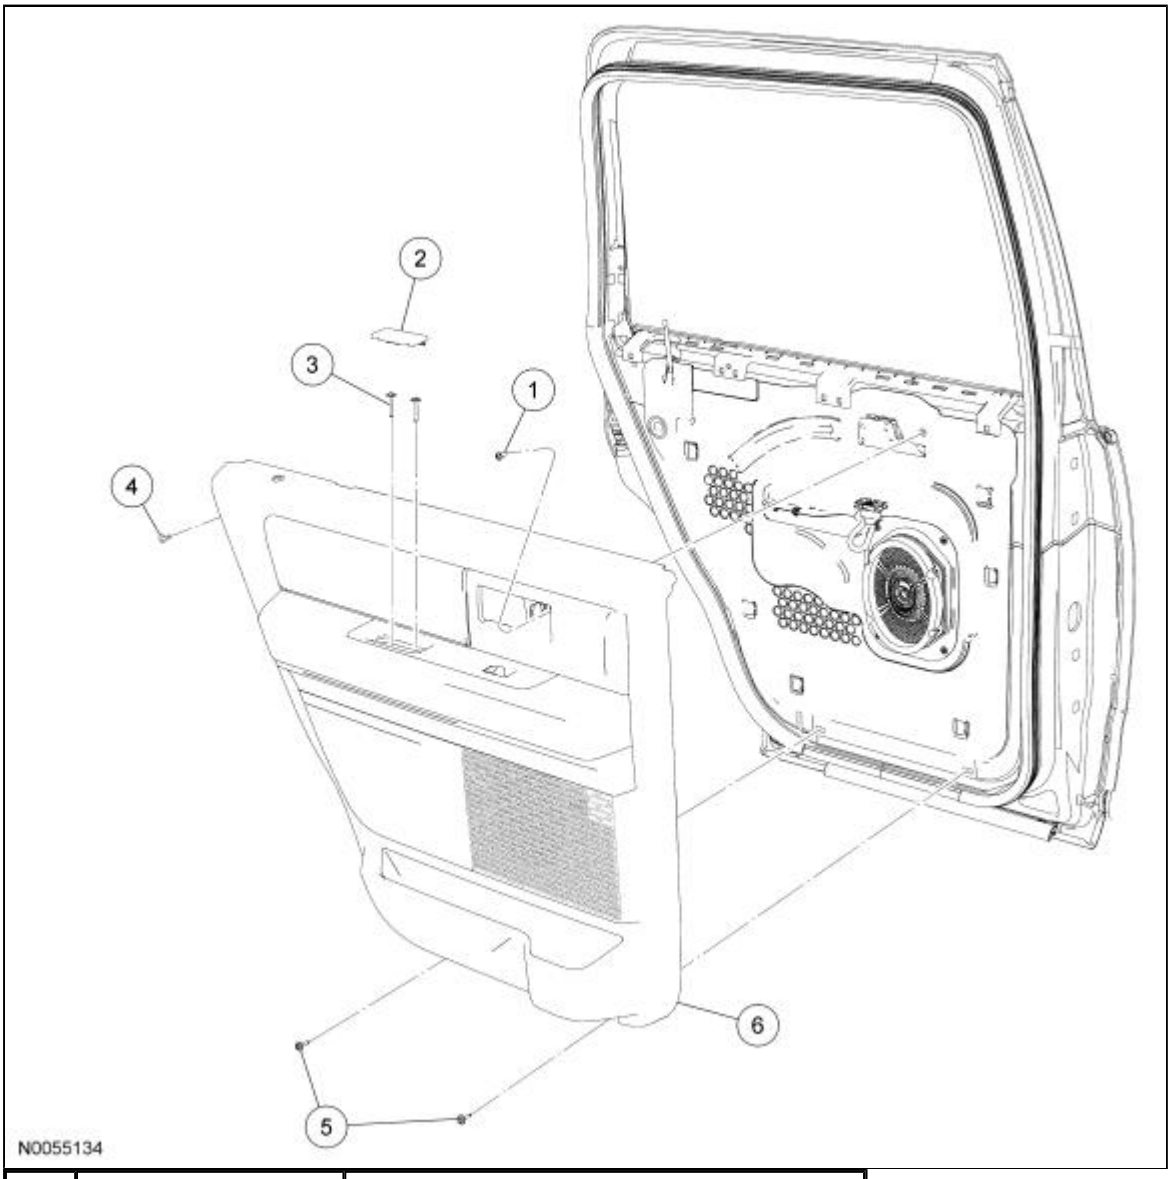
8. **CAUTION: To avoid damage to the door trim panel, lift the door trim panel by pulling directly upward on the armrest to disengage the panel clips.**

   Remove the front door trim panel.
    - Disconnect the electrical connectors.
9. To install, reverse the removal procedure.

Door Trim Panel — Rear

Printable View (216 KB)

NOTE: Expedition shown, Expedition EL and Navigator similar.



Item	Part Number	Description
1	W505156	Door handle screw
2	237W10	Rear door trim panel finish cover
3	W505156	Door trim panel armrest screw (2 required)
4	W708412	Door trim panel screw
5	W708392	Lower door trim panel screws (2 required)
6	27406 RH/ 27407 LH	Rear door trim panel

Removal and Installation

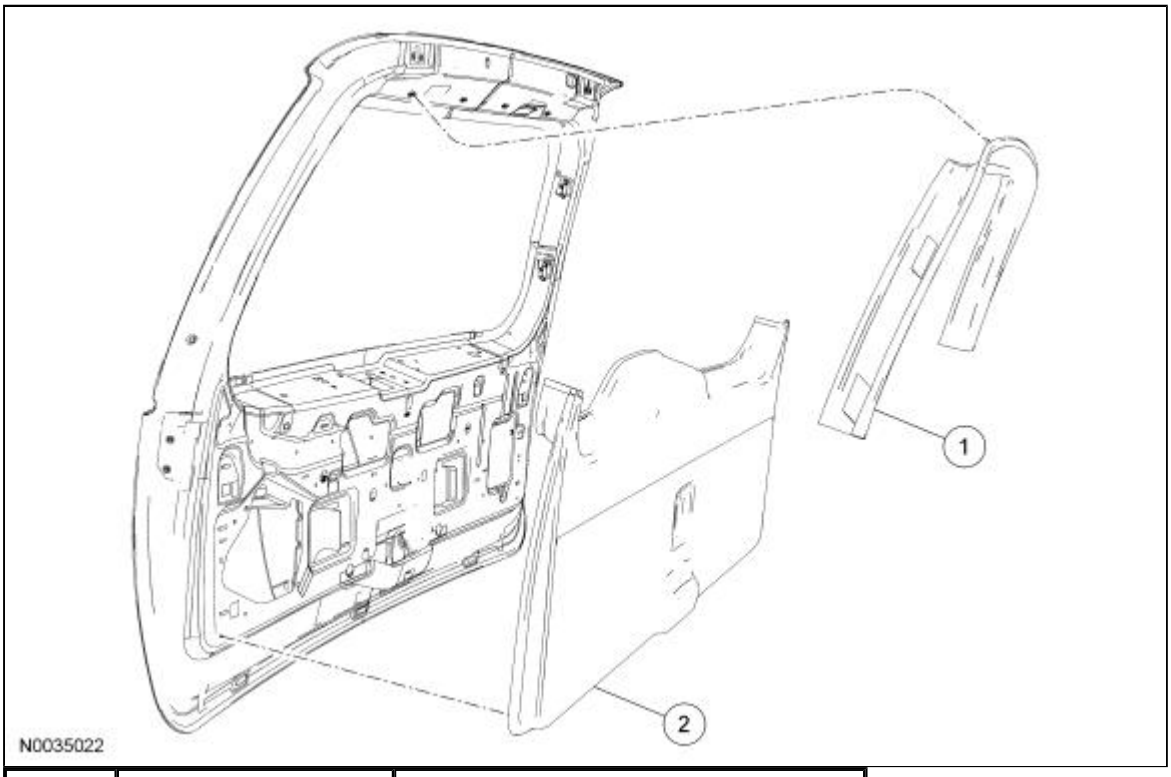
NOTE: Left rear door shown, right rear door similar.

1. Remove the door handle screw cover.
    - Use the service notch.
2. Remove the door handle screw.
3. Remove the rear door trim panel finish cover.
4. Remove the 2 door trim panel screws.
5. Remove the door trim panel screw.
6. Remove the 2 lower door trim panel screws.
7. **CAUTION: To avoid damage to the door trim panel, lift the door trim panel by pulling directly upward on the armrest to disengage the panel clips.**

   Remove the rear door trim panel.
    - If equipped, disconnect the electrical connectors.
8. To install, reverse the removal procedure.

Liftgate Trim Panel

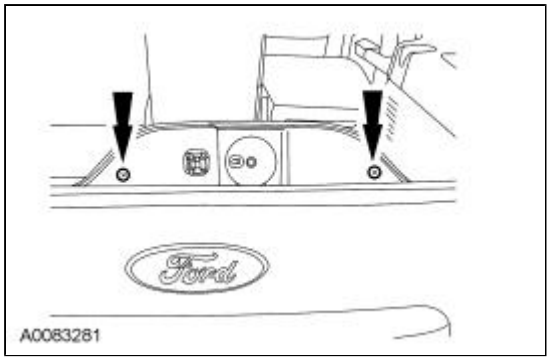
Printable View (212 KB)



Item	Part Number	Description
1	42410	Upper liftgate trim panel
2	46404	Lower liftgate trim panel

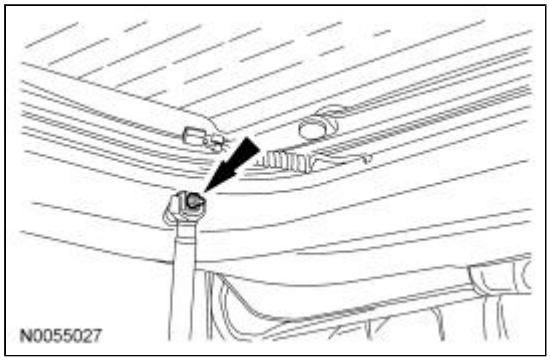
All vehicles

1. Open the liftgate and remove the scrivets.



Vehicles with power liftgate

2. Remove the power liftgate rod-to-liftgate cover and nut.
   - To install, tighten to 11 Nm (8 lb-ft).

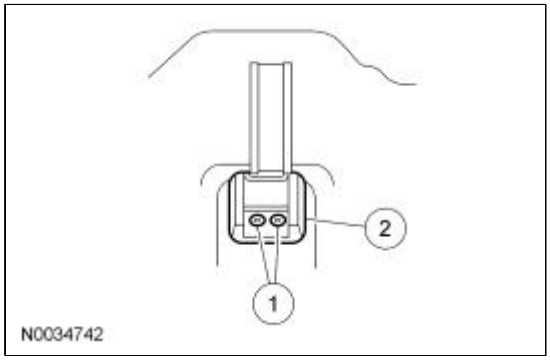


3. Remove the power liftgate rod.

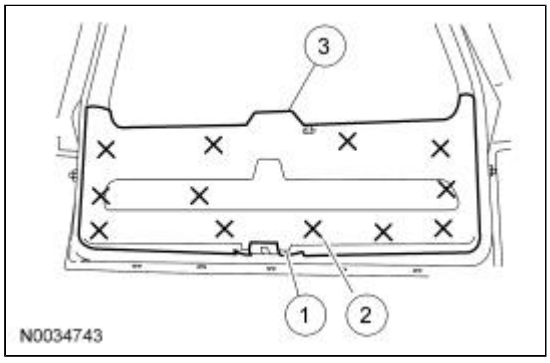
All vehicles

4. Open the liftgate and remove the upper liftgate trim panel.
    - Pull lower corners toward the center on both sides and pull down along the top.

5. Remove the assist handle.
    1. Remove the screws.
    2. Remove the assist handle.



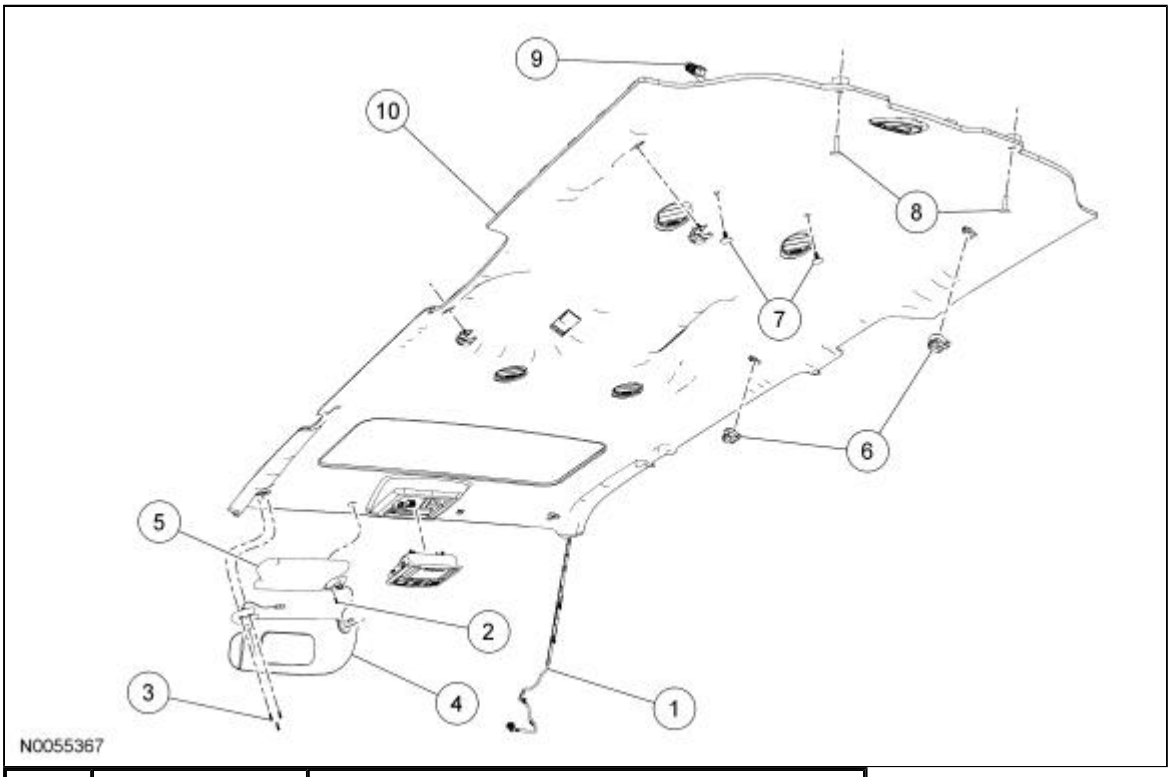
6. Remove the lower liftgate trim panel.
    1. Hold the trim panel at the center area and slightly pull on the center clips to allow a tool to access the clips.
    2. Release the 12 clips 2 to 3 at a time, starting from the right side working to the left side.
    3. Once all the clips are released, slide the liftgate trim panel forward and down, away from the sheet metal.



7. To install, reverse the removal procedure.

Headliner

Printable View (355 KB)

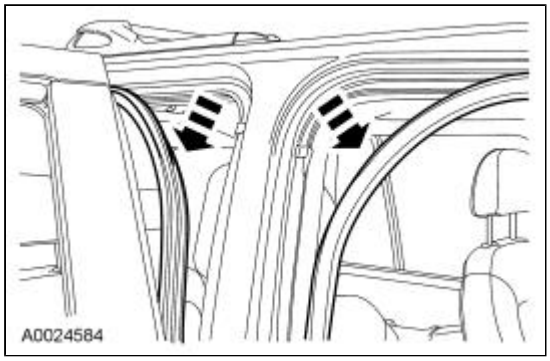


Item	Part Number	Description
1	17C712	Front headliner wiring harness
2	—	Sun visor screw
3	—	Sun visor screw (3 required)
4	04104	Sun visor
5	—	Auxiliary sun visor
6	29024	Garment hangers (4 required)
7	50908B	Center pin-type retainers (2 required)
8	50908A	Lower pin-type retainers (2 required)
9	13A409	Rear headliner wiring harness
10	51944	Headliner

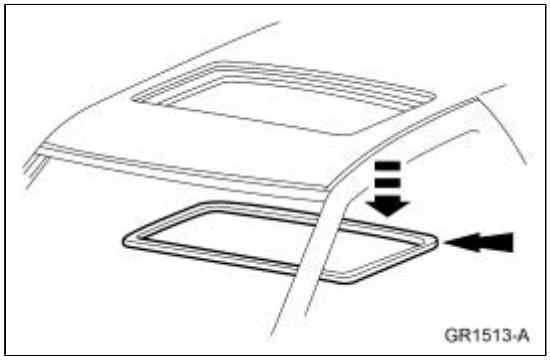
All vehicles

1. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

2. Position aside the front and rear door seals.

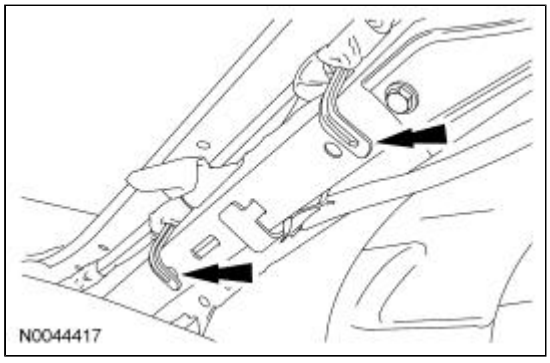


3. If equipped, remove the roof opening panel trim.

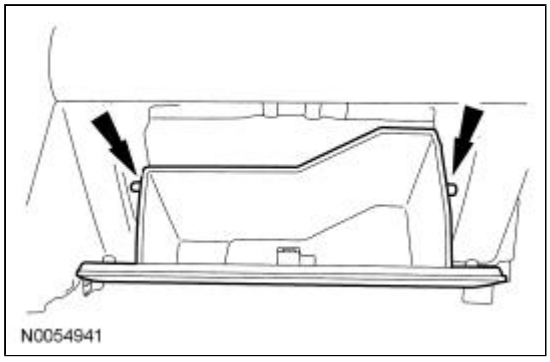


4. Remove the LH and RH A-pillar trim panels. For additional information, refer to A-Pillar Trim Panel in this section.

5. Remove the 2 wiring harness pin-type retainers from the A-pillar.

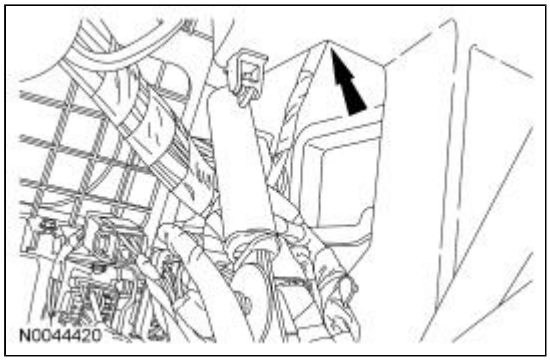


6. Open and fully lower the glove compartment.
    - Release the glove compartment tabs.



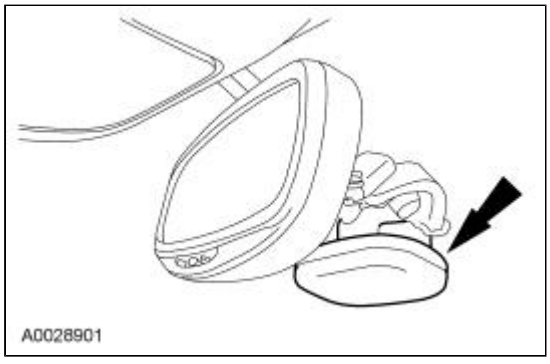
7. If equipped, disconnect the satellite radio antenna.

8. Remove the pin-type retainer and disconnect the electronic compass/auto-dimming rearview mirror electrical connector.

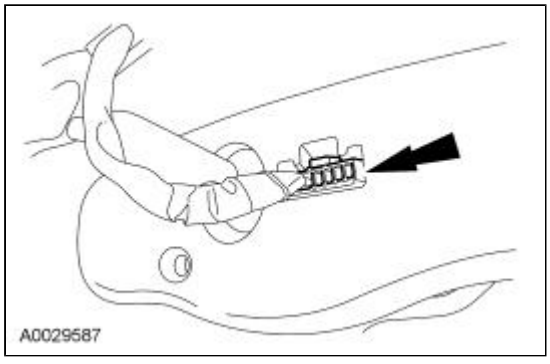


9. If equipped, separate the satellite antenna cable from the wiring harness.

10. If equipped, remove the electronic compass sensor.



11. If equipped, disconnect the auto-dimming mirror electrical connector.



12. Remove the LH and RH sun visor clips.
    - Remove the 8 screws.
    - Remove the sun visors and visor clips.
        - If equipped, disconnect the electrical connectors.

13. If equipped, remove the overhead console.
    - Disconnect the electrical connectors.

14. If equipped, remove the DVD player. For additional information, refer to Section 415-07 .

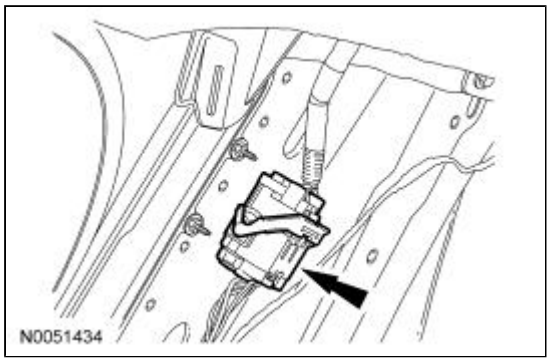
15. Remove the LH and RH B-pillar trim panels. For additional information, refer to B-Pillar Trim

Panel in this section.

16. Remove the LH and RH C-pillar trim panels. For additional information, refer to C-Pillar Trim Panel in this section.

17. Remove the LH and RH D-pillar trim panels. For additional information, refer to D-Pillar Trim Panel in this section.

18. Disconnect the rear electrical connector.



Vehicles with safety canopies

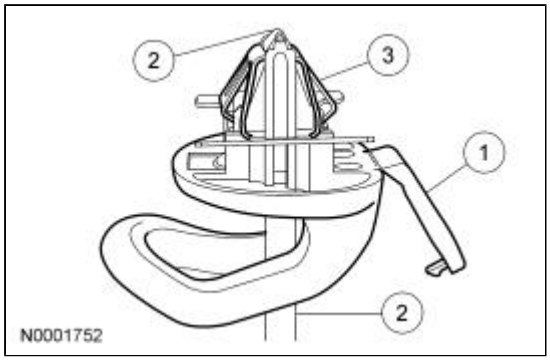
19. Remove the 4 garment hangers.
    - Open the access panel.
    - Remove the garment hanger screws.

Vehicles without safety canopies

20. **CAUTION: To prevent damage to the garment hanger retainer, use a 3/16-inch flat-blade screwdriver for this step.**

    NOTE: The garment hanger is shown without the roof sheet metal to show the metal retainer clip. The metal retainer clip will remain engaged in the sheet metal after the garment hanger is removed.

    Remove the 2 garment hangers.
    1. Open the access cover.
    2. Insert the flat-blade screwdriver fully into the garment slot.
    3. Rotate the screwdriver 90 degrees so that the screwdriver spreads the metal retainer clip. Remove the plastic garment hanger.



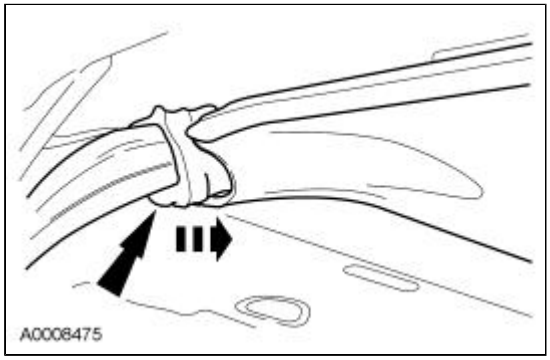
All vehicles

21. Remove the center pin-type retainers.

22. Remove the rear pin-type retainers.

Vehicles with rear climate control

23. Tilt the headliner to release the vent duct.



All vehicles

24. Remove the headliner.

25. To install, reverse the removal procedure.
    - Transfer parts as necessary.

Torque Specifications

Description	Nm	lb-ft	lb-in
Running board retaining bolts	23	17	—
Retractable running board step screws	12	9	—
Retractable running board wedge screw	8	—	71

Exterior Trim

Printable View (63 KB)

The exterior trim and ornamentation consists of the:

- rear door finish panel.
- body side opening moulding.
- front fender wheel opening moulding.
- grille assembly.
- front fender side finish panel.
- front door side finish panel.
- front door window outside rear moulding.
- body side window outside front moulding.
- running boards.
- power running boards (PRBs) (if equipped).

If equipped, the PRBs automatically move when the doors are opened to assist entering and exiting the vehicle.

The PRB feature may be enabled/disabled through the message center.

When the PRB is disabled (OFF), the PRB will immediately move to the stowed position regardless of the position of the doors.

When the PRB is enabled (AUTO), the PRBs will extend when the doors are opened and return to the stowed position when the doors are closed or vehicle speed is greater than 8 kph (5 mph).

When the PRBs are manually set to the deployed position (OUT), they will return to the stowed position and AUTO mode when the vehicle speed is greater than 8 kph (5 mph).

Retractable Running Board

Printable View (289 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The power running boards (PRBs) are controlled by the PRB module. The PRB motors receive motor + and - from the PRB module. The PRB module receives the door ajar messages from the controller area network (CAN) bus to determine motor function (deploy or stow).

When in AUTO mode, the PRBs will deploy when a door on the same side of the vehicle is opened. When both doors on the same side are closed, the PRBs will retract.

When in OUT mode, both PRBs will stay deployed until OUT mode is deselected, reset to AUTO mode or vehicle speed is greater than 5 mph. Mode will automatically switch back to AUTO once above 5 mph.

When an obstacle is detected, the PRB will reverse direction. If a second obstacle is detected, the PRB will reverse direction again. If a third obstacle is detected, the PRB will stop against the third obstacle until the following conditions are met:

- Change in door ajar status
- Change in the message center status (AUTO, OUT, OFF)
- Vehicle speed greater than 5 mph

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage

Visual Inspection Chart

Mechanical	Electrical

• Power running board (PRB)	• Battery junction box (BJB) fuse 7 (40A)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PRB module.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the PRB module.

9. If the DTCs retrieved are related to the concern, go to Power Running Board Module Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Power Running Board Module (PRB) Diagnostic Trouble Code (DTC) Chart

Power Running Board Module (PRB) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1162	PRB Hall-Effect Sensor Power Circuit Short to Battery	Go To Pinpoint Test E .
B1163	Left PRB Hall-Effect Sensor Failure	Go To Pinpoint Test E .
B1164	PRB Hall-Effect Sensor Power Circuit Short to Ground	Go To Pinpoint Test E .
B1167	Left PRB Deploy and/or Stow Circuit Short to Battery	Go To Pinpoint Test D .
B1168	Left PRB Motor Circuit	Go To Pinpoint Test D .

	Short to Ground	
B1169	LH Motor Traveled Too Far	LH motor is freewheeling (broken geartrain linkage). INSTALL a new LH PRB motor. REFER to Retractable Running Board Motor in this section.
B116A	RH Motor Traveled Too Far	RH motor is freewheeling (broken geartrain linkage). INSTALL a new RH PRB motor. REFER to Retractable Running Board Motor in this section.
B116B	LH PRB Motor Short	Go To Pinpoint Test D .
B116C	RH PRB Motor Short	Go To Pinpoint Test D .
B116D	LH PRB Motor Line Open	Go To Pinpoint Test D .
B116E	RH PRB Motor Line Open	Go To Pinpoint Test D .
B1170	Right PRB Hall-Effect Sensor Failure	Go To Pinpoint Test E .
B1171	Left PRB Hall-Effect Signal Noisy	INSTALL a new LH PRB motor. REFER to Retractable Running Board Motor in this section.
B1172	Right PRB Hall-Effect Signal Noisy	INSTALL a new RH PRB motor. REFER to Retractable Running Board Motor in this section.
B1175	Right PRB Motor Circuit Short to Ground	Go To Pinpoint Test D .
B1178	Right PRB Deploy and/or Stow Circuit Short to Battery	Go To Pinpoint Test D .
B1317	Battery Voltage High	REFER to Section 414-00 .
B1318	Battery Voltage Low	REFER to Section 414-00 .
B1342	ECU is Faulted	INSTALL a new PRB module. REFER to Retractable Running Board Module in this section.
B2139	Data Mismatch (receive data does not match what was expected)	REFER to Section 419-10 .
B2813	LH PRB Stow Time Fail	Go To Pinpoint Test F .
B2814	LH PRB Deploy Time Fail	Go To Pinpoint Test F .
B2816	RH PRB Stow Time Fail	Go To Pinpoint Test F .
B2817	RH PRB Deploy Time Fail	Go To Pinpoint Test F .
U1900	CAN Communication Bus Fault - Receive Error	Do not install a new PRB module as part of the repair for a PRB DTC U1900 fault. The PRB is not the source of the fault when DTC U1900 is present. REFER to Section 418-00 to diagnose the MS-CAN network concern.
U2050	No Application Present	REFER to Section 418-01 to carry out programmable module installation (PMI). CLEAR the DTCs. RETRIEVE the DTCs and VERIFY successful module configuration. If DTC U2050 is retrieved again. INSTALL a new PRB module. REFER to Section 419-10 . REPEAT the self-test.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the power running board module	• Fuse • Circuitry • Power running board (PRB) module ▪ Communication with cluster	• REMOVE battery junction box (BJB) fuse 7 (40A) and verify it is OK. If OK, CHECK circuit SBB07 (WH/RD) and ground circuit GD143 (BK/VT) for short or open. If OK, REINSTALL fuse (to drive a logic reset) and CLEAR the DTCs. REPEAT the self-test. If still unable to communicate with the PRB module, INSTALL a new PRB module. REFER to Retractable Running Board Module in this section.
• The retractable running board does not operate correctly — both running boards	• Fuse • Circuitry • Smart junction box (SJB) • PRB module • Powertrain control module (PCM) (5 mph function only) • Instrument cluster module (ICM)	• Go To Pinpoint Test A .
• The retractable running board does not operate correctly — left running board	• Circuitry • PRB mechanical assembly • PRB motor • PRB module • SJB	• Go To Pinpoint Test B .
• The retractable running board does not operate correctly — right running board	• Circuitry • PRB mechanical assembly • PRB motor • PRB module • SJB	• Go To Pinpoint Test C .

Pinpoint Tests

Pinpoint Test A: The Retractable Running Board Does Not Operate Correctly — Both Running Boards

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Retractable Running Boards for schematic and connector information.

Normal Operation

The power running board (PRB) module receives power through circuit SBB07 (WH/RD) and ground through circuit GD143 (BK/VT). The LH and RH PRB motor Hall-effect sensors receive a regulated 10-volt power supply from the PRB module through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module receives door ajar and vehicle speed status over the controller area network (CAN).

Possible Causes

- Fuse
- Open in circuit CPR47 (GY/BN), RPR47 (BU/GN), GD143 (BK/VT) or SBB07 (WH/RD)
- Short to battery in circuit CPR47 (GY/BN)
- Short to ground in circuit CPR47 (GY/BN)
- PRB module
- Smart junction box (SJB)

NOTE: If any door ajar or VSS-related DTCs are present, diagnose the door ajar and VSS-related DTCs before performing this pinpoint test.

PINPOINT TEST A: THE RETRACTABLE RUNNING BOARD DOES NOT OPERATE CORRECTLY — BOTH RUNNING BOARDS

Test Step	Result / Action to Take
A1 CHECK THE OPERATION OF THE POWER RUNNING BOARDS — AUTOMATIC MODE	
• Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when a door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the LH rear door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH rear door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Did both PRBs operate correctly, with no reversal of motion or noise while in motion?**	**Yes** The system is operating as designed. REVIEW operation of the PRB system with the customer. **No** GO to A2.
A2 CHECK THE OPERATION OF THE POWER RUNNING BOARDS — MANUAL MODE	
• Set the PRB system to the OUT mode, where the boards are deployed all the time, regardless of door open/closed status and vehicle speed is less than 5 mph. • **Did both PRBs deploy?**	**Yes** GO to A4. **No** GO to A3.
A3 CHECK THE POWER RUNNING BOARDS FOR FOREIGN MATERIAL	
• **NOTE:** If the system has false bounce back, stops in mid travel, noisy or will not deploy or stow completely, check to see if any foreign material is caught in the PRB hinge points, step area or door sill. If foreign material is found, clean the PRB hinge points, step area and door sill with a high-pressure washer. If the system operates correctly after cleaning, refer the customer to the owner guide for correct cleaning instructions. • Check the PRB hinge points, step area and door sill of the LH and RH PRBs for foreign material or blockage. If any foreign material or blockage is found, remove it, and if necessary, set the PRB system to the OUT mode and clean the PRB hinge points, step area and door sill with a high-pressure washer. Avoid direct spray to the motor. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when a door on the same side is opened, and retract when the door is closed.	**Yes** The system is operating normally. The concern may have been caused by foreign material or blockage in the PRB hinge points, step area or door sill. REFER the customer to the owner guide for correct cleaning instructions. **No** GO to A4.

• Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Does the PRB system operate normally during all test steps?**	
A4 VERIFY THE DOOR AJAR OPERATION	
• Open and close each door, verify the interior lights operate correctly and door ajar is noted on the vehicle message center. • **Do the interior lights turn ON when the door is opened and OFF when the door is closed?**	**Yes** GO to A5 . **No** REFER to Section 417-02 to diagnose the interior lighting concern before attempting to diagnose the PRB concern.
A5 CHECK CIRCUIT CPR47 (GY/BN) FOR VOLTAGE AND CIRCUIT RPR47 (BU/GN) FOR GROUND	
• Disconnect: Power Running Board LH Motor C3185. • Disconnect: Power Running Board RH Motor C3186. • Key in ON position. • Measure the voltage between RH PRB motor C3186-2, circuit CPR47 (GY/BN) and C3186-6, circuit RPR47 (BU/GN).  N0040364 • Open door associated with side tested. • Voltage signal will only be present for approximately one second. • **Is the voltage between 7 and 10.5 volts?**	**Yes** GO to A11 . **No** If the voltage was less than 7 volts, GO to A6 . If the voltage was greater than 10.5 volts, GO to A10 .
A6 CHECK CIRCUIT CPR47 (GY/BN) FOR VOLTAGE	
• Measure the voltage between RH PRB motor C3186-2, circuit CPR47 (GY/BN) and ground.  N0040365 • Open door associated with side tested. • Voltage signal will only be present for approximately one second. • **Is the voltage between 7 and 10.5 volts?**	**Yes** GO to A9 . **No** GO to A7 .
A7 CHECK CIRCUIT CPR47 (GY/BN) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position.	**Yes** GO to A8 .

• Disconnect: Power Running Board Module C3313b. • Measure the resistance between RH PRB motor C3186-2, circuit CPR47 (GY/BN) and PRB module C3313b-5, circuit CPR47 (GY/BN); and between RH PRB motor C3186-2, circuit CPR47 (GY/BN) and ground.  N0055094 • **Is the resistance less than 5 ohms and greater than 10,000 ohms to ground?**	**No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A8 CHECK CIRCUIT SBB07 (WH/RD) FOR VOLTAGE	
• Measure the voltage between PRB module C3313b-1, circuit SBB07 (WH/RD) and ground.  N0055096 • **Is battery voltage present?**	**Yes** GO to A11 . **No** VERIFY battery junction box (BJB) fuse 7 (40A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A9 CHECK CIRCUIT RPR47 (BU/GN) FOR AN OPEN	
• Key in OFF position. • Disconnect: Power Running Board Module C3313b. • Measure the resistance between RH PRB motor C3186-6, circuit RPR47 (BU/GN) and PRB module C3313b-14, circuit RPR47 (BU/GN).  N0055095 • **Is the resistance less than 5 ohms?**	**Yes** GO to A11 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A10 CHECK CIRCUIT CPR47 (GY/BN) FOR A SHORT TO BATTERY	
• Key in OFF position. • Disconnect: Power Running Board Module C3313b. • Key in ON position. • Measure the voltage between RH PRB motor C3186-2, circuit CPR47 (GY/BN) and ground.	**Yes** REPAIR the circuit. **No** GO to A11 .

 N0040365 ● Open door associated with side tested. ● Voltage signal will only be present for approximately one second. ● **Is the voltage greater than 10.5 volts?**	
A11 CHECK THE POWER RUNNING BOARD MODULE FOR CORRECT OPERATION	
● Connect: Power Running Board LH Motor C3185. ● Connect: Power Running Board RH Motor C3186. ● Visually inspect all PRB module connectors. ● Check for: ■ corrosion. ■ pushed-out pins. ● Connect all PRB module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	**Yes** INSTALL a new PRB module. REFER to Retractable Running Board Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: The Retractable Running Board Does Not Operate Correctly — Left Running Board

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Retractable Running Boards for schematic and connector information.

Normal Operation

The power running board (PRB) module receives door ajar, operating configuration from the cluster and vehicle speed status over the controller area network (CAN). During LH PRB deployment, the PRB module supplies power to the LH PRB motor through circuit CPR41 (BU/WH) and ground through circuit CPR42 (WH). The PRB stows the LH PRB by supplying power to the LH PRB motor through circuit CPR42 (WH) and ground through circuit CPR41 (BU/WH). The PRB module provides a regulated 10-volt power supply to the Hall-effect sensor (internal to the PRB motor) through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module monitors the LH PRB Hall-effect signal through circuit VPR43 (GY/BU). If the PRB module does not receive any signal from the Hall-effect sensor during operation, the PRB will stop.

Possible Causes

- Open in circuit CPR47 (GY/BN), RPR47 (BU/GN), VPR43 (GY/BU), CPR41 (BU/WH) or CPR42 (WH)
- Short to ground in circuit VPR43 (GY/BU), CPR41 (BU/WH) or CPR42 (WH)
- Short to battery in circuit VPR43 (GY/BU), CPR41 (BU/WH) or CPR42 (WH)

- Short circuit between CPR41 (BU/WH) and CPR42 (WH)
- PRB module
- LH PRB mechanical assembly
- LH PRB motor

PINPOINT TEST B: THE RETRACTABLE RUNNING BOARD DOES NOT OPERATE CORRECTLY — LEFT RUNNING BOARD

Test Step	Result / Action to Take
B1 CHECK THE OPERATION OF THE POWER RUNNING BOARDS — MANUAL MODE	
• Set the PRB system to the OUT mode, where the boards are deployed all the time, regardless of door open/closed status and vehicle speed is less than 5 mph. • **Did both PRBs deploy?**	**Yes** GO to B3. **No** GO to B2.
B2 CHECK THE POWER RUNNING BOARDS FOR FOREIGN MATERIAL	
• **NOTE:** If the system has false bounce back, stops in mid travel, noisy or will not stow completely, extend the PRB and check to see if any foreign material is caught in the PRB hinge points, step area or door sill. If foreign material is found, clean the PRB hinge points, step area and door sill with a high-pressure washer. If the system operates correctly after cleaning, refer the customer to the owner guide for correct cleaning instructions. • Check the PRB hinge points, step area and door sill of the LH PRBs for foreign material or blockage. If any foreign material or blockage is found, remove it, and if necessary, set the PRB system to the OUT mode and clean the PRB hinge points, step area and door sill with a high-pressure washer. Avoid direct spray to the motor. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when either door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • **Does the LH PRB operate normally during all test steps?**	**Yes** The system is operating normally. The concern may have been caused by foreign material or blockage in the PRB hinge points, step area or door sill. REFER the customer to the owner guide for correct cleaning instructions. **No** GO to B3.
B3 VERIFY THE DOOR AJAR OPERATION	
• Open and close the LH front and LH rear door, and verify the interior lights operate correctly and door ajar is noted on the vehicle message center. • **Do the interior lights turn ON when the door is opened, and OFF when the door is closed?**	**Yes** GO to B4. **No** REFER to Section 417-02 to diagnose the interior lighting concern before attempting to diagnose the PRB concern.
B4 CHECK CONTINUITY BETWEEN LH AND RH MOTORS ON CIRCUIT CPR47 (GY/BN) AND CIRCUIT RPR47 (BU/GN)	
• Disconnect: Power Running Board LH Motor C3185. • Disconnect: Power Running Board RH Motor C3186. • Key in OFF position. • Measure the resistance between LH PRB motor C3185-2, circuit CPR47 (GY/BN) and RH PRB motor C3186-2, circuit CPR47	**Yes** GO to B5. **No** REPAIR the circuit.

(GY/BN) harness side; and between LH PRB motor C3185-6, circuit RPR47 (BU/GN) and RH running PRB motor C3186-6, circuit RPR47 (BU/GN) harness side.  N0040369 • **Are the resistances less than 5 ohms between the LH and RH PRB motor connectors?**	CLEAR the DTCs. REPEAT the self-test.
B5 CHECK FOR A SHORT TO BATTERY IN CIRCUIT VPR43 (GY/BU), CPR41 (BU/WH) OR CPR42 (WH)	
• Key in OFF position. • Disconnect: Power Running Board Module C3313a. • Disconnect: Power Running Board Module C3313b. • Key in ON position. • Measure the voltage between LH PRB motor C3185-3, circuit VPR43 (GY/BU) and ground; and between LH PRB motor C3185-5, circuit CPR41 (BU/WH) and ground; and between C3185-1, circuit CPR42 (WH) and ground.  N0040370 • **Is battery voltage present on any of the circuits tested?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to B6 .
B6 CHECK FOR AN OPEN OR SHORT TO GROUND IN CIRCUIT VPR43 (GY/BU), CPR41 (BU/WH) OR CPR42 (WH)	
• Key in OFF position. • Measure the resistances between PRB module C3313a or C3313b, harness side and LH PRB motor C3185, harness side; and between the LH PRB motor C3185, harness side and ground as follows: **LH Motor Connector** / **PRB Module Connector** / **Circuit** C3185-3 / C3313b-9 / VPR43 (GY/BU) C3185-5 / C3313a-1 / CPR41 (BU/WH) C3185-1 / C3313a-2 / CPR42 (WH) • **Are the resistances less than 5 ohms between the LH PRB motor and PRB module; and greater than 10,000 ohms between the LH PRB motor and ground?**	**Yes** GO to B7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B7 CHECK FOR A SHORT BETWEEN CIRCUIT CPR41 (BU/WH)	

AND CIRCUIT CPR42 (WH)	
• Measure the resistance between LH PRB motor C3185-5, circuit CPR41 (BU/WH) and C3185-1, circuit CPR42 (WH).  N0040371 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B8 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B8 CHECK THE LH RUNNING BOARD MOTOR FOR AN OPEN CIRCUIT	
• Measure the resistance between LH PRB motor C3185-5, circuit CPR41 (BU/WH), component side and C3185-1, circuit CPR42 (WH) component side.  N0055108 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new LH PRB motor. REFER to Retractable Running Board Motor in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to B9 .
B9 CHECK THE POWER RUNNING BOARD MODULE FOR CORRECT OPERATION	

• Connect: Power Running Board LH Motor C3185.
• Connect: Power Running Board RH Motor C3186.
• Visually inspect all PRB module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all PRB module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PRB module. REFER to Retractable Running Board Module in this section. CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: The Retractable Running Board Does Not Operate Correctly — Right Running Board

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Retractable Running Boards for schematic and connector information.

Normal Operation

The power running board (PRB) module receives door ajar, operating configuration from the cluster and vehicle speed status over the controller area network (CAN). During RH PRB deployment, the PRB module supplies power to the RH PRB motor through circuit CPR44 (BN/WH) and ground through circuit CPR45 (VT/GY). The PRB module stows the RH PRB by supplying power to the RH PRB motor through circuit CPR45 (VT/GY) and ground through circuit CPR44 (BN/WH). The PRB module provides a regulated 10-volt power supply to the Hall-effect sensor (internal to the PRB motor) through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module monitors the RH PRB Hall-effect signal through circuit VPR46 (GY/OG). If the PRB module does not receive any signal from the Hall-effect sensor during operation, the PRB will stop.

Possible Causes

- Open in circuit CPR47 (GY/BN), RPR47 (BU/GN), VPR46 (GY/OG), CPR44 (BN/WH) or CPR45 (VT/GY)
- Short to ground in circuit VPR46 (GY/OG), CPR44 (BN/WH) or CPR45 (VT/GY)
- Short to battery in circuit VPR46 (GY/OG), CPR44 (BN/WH) or CPR45 (VT/GY)
- Short circuit between CPR44 (BN/WH) and CPR45 (VT/GY)
- PRB module
- RH PRB mechanical assembly
- RH PRB motor

PINPOINT TEST C: THE RETRACTABLE RUNNING BOARD DOES NOT OPERATE CORRECTLY — RIGHT RUNNING BOARD

Test Step	Result / Action to Take
C1 CHECK THE OPERATION OF THE POWER RUNNING BOARDS — MANUAL MODE	
• Set the PRB system to the OUT mode, where the boards are deployed all the time, regardless of door open/closed status and vehicle speed is less than 5 mph. • **Did both PRBs deploy?**	**Yes** GO to C3 . **No** GO to C2 .
C2 CHECK THE POWER RUNNING BOARDS FOR FOREIGN MATERIAL	
• **NOTE:** If the system has false bounce back, stops in mid travel, noisy or will not stow completely, extend the PRB and check to see if any foreign material is caught in the PRB hinge points, step area or door sill. If foreign material is found, clean the PRB hinge points, step area and door sill with a high-pressure washer. If the system operates correctly after cleaning, refer the customer to the owner guide for correct cleaning instructions. • Check the PRB hinge points, step area and door sill of the RH PRBs for foreign material or blockage. If any foreign material or blockage is found, remove it, and if necessary, set the PRB system to the OUT mode and clean the PRB hinge points, step area and door sill with a high-pressure washer. Avoid direct spray to the motor. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when either door on the same side is opened, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Does the RH PRB operate normally during all test steps?**	**Yes** The system is operating normally. The concern may have been caused by foreign material or blockage in the PRB hinge points, step area or door sill. REFER the customer to the owner guide for correct cleaning instructions. **No** GO to C3 .
C3 VERIFY THE DOOR AJAR OPERATION	

• Open and close the RH front and RH rear door, and verify the interior lights operate correctly and door ajar is noted on the vehicle message center. • **Do the interior lights turn ON when the door is opened, and OFF when the door is closed?**	**Yes** GO to C4 . **No** REFER to Section 417-02 to diagnose the interior lighting concern before attempting to diagnose the PRB concern.
C4 CHECK CONTINUITY BETWEEN LH AND RH MOTORS ON CIRCUIT CPR47 (GY/BN) AND CIRCUIT RPR47 (BU/GN)	
• Disconnect: Power Running Board LH Motor C3185. • Disconnect: Power Running Board RH Motor C3186. • Key in OFF position. • Measure the resistance between LH PRB motor C3185-2, circuit CPR47 (GY/BN) and RH PRB motor C3186-2, circuit CPR47 (GY/BN) harness side; and between LH PRB motor C3185-6, circuit RPR47 (BU/GN) and RH PRB motor C3186-6, circuit RPR47 (BU/GN) harness side.  N0040369 • **Are the resistances less than 5 ohms between the LH and RH PRB motor connectors?**	**Yes** GO to C5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C5 CHECK FOR A SHORT TO BATTERY IN CIRCUIT VPR46 (GY/OG), CPR44 (BN/WH) OR CPR45 (VT/GY)	
• Key in OFF position. • Disconnect: Power Running Board Module C3313a. • Disconnect: Power Running Board Module C3313b. • Key in ON position. • Measure the voltage between RH PRB motor C3186-3, circuit VPR46 (GY/OG) and ground; and between RH PRB motor C3186-5, circuit CPR44 (BN/WH) and ground; and between C3186-1, circuit CPR45 (VT/GY) and ground.  N0040370 • **Is battery voltage present on any of the circuits tested?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to C6 .
C6 CHECK FOR AN OPEN OR SHORT TO GROUND IN CIRCUIT VPR46 (GY/OG), CPR44 (BN/WH) OR CPR45 (VT/GY)	
• Key in OFF position. • Measure the resistances between PRB module C3313a or	**Yes** GO to C7 .

C3313b, harness side and RH PRB motor C3185, harness side; and between the RH PRB motor C3185, harness side and ground as follows:

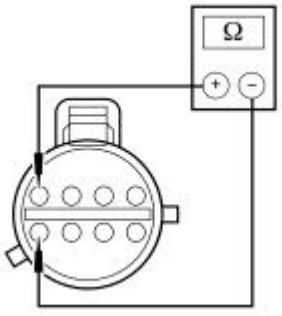
RH Motor Connector	PRB Module Connector	Circuit
C3186-3	C3313b-10	VPR46 (GY/OG)
C3186-5	C3313a-4	CPR44 (BN/WH)
C3186-1	C3313a-3	CPR45 (VT/GY)

- **Are the resistances less than 5 ohms between the RH PRB motor and PRB module; and greater than 10,000 ohms between the RH PRB motor and ground?**

No
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

C7 CHECK FOR A SHORT BETWEEN CIRCUIT CPR44 (BN/WH) AND CIRCUIT CPR45 (VT/GY)

- Measure the resistance between RH PRB motor C3186-5, circuit CPR44 (BN/WH) and C3186-1, circuit CPR45 (VT/GY).



N0040371

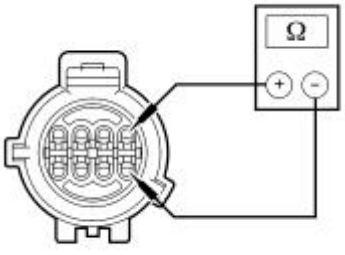
- **Is the resistance greater than 10,000 ohms?**

Yes
GO to C8.

No
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

C8 CHECK THE RH RUNNING BOARD MOTOR FOR AN OPEN CIRCUIT

- Measure the resistance between RH PRB motor C3186-5, circuit CPR44 (BN/WH), component side and C3186-1, circuit CPR45 (VT/GY) component side.



N0055108

- **Is the resistance greater than 10,000 ohms?**

Yes
INSTALL a new RH PRB motor. REFER to Retractable Running Board Motor in this section. CLEAR the DTCs. REPEAT the self-test.

No
GO to C9.

C9 CHECK THE POWER RUNNING BOARD MODULE FOR CORRECT OPERATION

- Connect: Power Running Board LH Motor C3185.
- Connect: Power Running Board RH Motor C3186.
- Visually inspect all PRB module connectors.
- Check for:
  - corrosion.
  - pushed-out pins.

Yes
INSTALL a new PRB module. REFER to Retractable Running Board Module in this section. CLEAR the

• Connect all PRB module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The Retractable Running Board Does Not Operate Correctly — DTC B1167, B1168, B1178, B1175, B116B, B116D, B116C or B116E

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Retractable Running Boards for schematic and connector information.

Normal Operation

During power running board (PRB) deployment, the PRB module supplies power to the PRB motor through circuit CPR41 (BU/WH) (LH) or CPR44 (BN/WH) (RH) and ground through circuit CPR42 (WH) (LH) or CPR45 (VT/GY) (RH). The PRB module stows the PRB by supplying power to the PRB motor through circuit CPR42 (WH) (LH) or CPR45 (VT/GY) (RH) and ground through circuit CPR41 (BU/WH) (LH) or CPR44 (BN/WH) (RH). The PRB module provides a regulated 10 volt power supply to the Hall-effect sensor (internal to the PRB motor) through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module monitors the PRB Hall-effect signal through circuit VPR43 (GY/BU) (LH) or VPR46 (GY/OG) (RH). If the PRB module does not receive any signal from the Hall-effect sensor during operation, the PRB will stop.

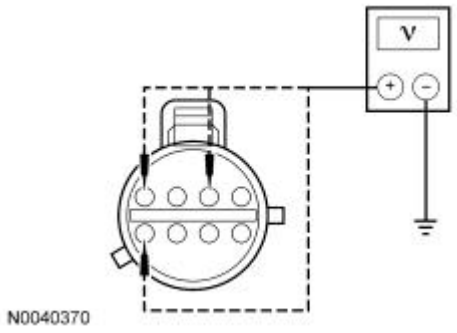
Possible Causes

- Open in circuit CPR47 (GY/BN), RPR47 (BU/GN), VPR43 (GY/BU), VPR46 (GY/OG), CPR41 (BU/WH), CPR44 (BN/WH), CPR42 (WH) or CPR45 (VT/GY)
- Short to ground in circuit VPR43 (GY/BU), VPR46 (GY/OG), CPR44 (BN/WH) or CPR45 (VT/GY)
- Short to battery in circuit VPR43 (GY/BU), VPR46 (GY/OG), CPR41 (BU/WH), CPR44 (BN/WH), CPR42 (WH) or CPR45 (VT/GY)
- Short circuit between CPR41 (BU/WH) and CPR42 (WH) or CPR44 (BN/WH) and CPR45 (VT/GY)
- LH or RH PRB motor assembly
- PRB module

PINPOINT TEST D: THE RETRACTABLE RUNNING BOARD DOES NOT OPERATE CORRECTLY — DTC B1167, B1168, B1178, B1175, B116B, B116D, B116C OR B116E

Test Step	Result / Action to Take
D1 CHECK FOR A SHORT TO BATTERY IN CIRCUIT VPR43 (GY/BU), VPR46 (GY/OG), CPR41 (BU/WH), CPR44 (BN/WH), CPR42 (WH) OR CPR45 (VT/GY)	
• Key in OFF position. • Disconnect: Power Running Board Module C3313a. • Disconnect: Power Running Board Module C3313b. • Key in ON position. • For DTCs B1167, B1168, B116B or B116D, measure the voltage	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

between LH PRB motor C3185-3, circuit VPR43 (GY/BU) and ground; and between LH PRB motor C3185-5, circuit CPR41 (BU/WH) and ground; and between C3185-1, circuit CPR42 (WH) and ground.



- For DTCs B1178 or B1175, B116C or B116E, measure the voltage between RH PRB motor C3186-3, circuit VPR46 (GY/OG) and ground; and between RH PRB motor C3186-5, circuit CPR44 (BN/WH) and ground; and between C3186-1, circuit CPR45 (VT/GY) and ground.
- **Is battery voltage present on any of the circuits tested?**

No
GO to D2 .

D2 CHECK FOR AN OPEN OR SHORT TO GROUND IN CIRCUIT VPR43 (GY/BU), VPR46 (GY/OG), CPR41 (BU/WH), CPR44 (BN/WH), CPR42 (WH) OR CPR45 (VT/GY)

- Key in OFF position.
- For DTCs B1167, B1168, B116B or B116D, measure the resistances between PRB module C4322a or C4322b, harness side and LH PRB motor C3185, harness side; and between the LH PRB motor C3185, harness side and ground as follows:

LH Motor Connector	PRB Module Connector	Circuit
C3185-3	C3313b-9	VPR43 (GY/BU)
C3185-5	C3313a-1	CPR41 (BU/WH)
C3185-1	C3313a-2	CPR42 (WH)

- B1178 or B1175, B116C or B116E, measure the resistances between PRB module C4322a or C4322b, harness side and RH PRB motor C3186, harness side; and between the RH PRB motor C3186, harness side and ground as follows:

RH Motor Connector	PRB Module Connector	Circuit
C3186-3	C3313b-10	VPR46 (GY/OG)
C3186-5	C3313a-4	CPR44 (BN/WH)
C3186-1	C3313a-3	CPR45 (VT/GY)

- **Are the resistances less than 5 ohms between the PRB motor and PRB module; and greater than 10,000 ohms between the PRB motor and ground?**

Yes
GO to D3 .

No
REPAIR the circuit.
CLEAR the DTCs.
REPEAT the self-test.

D3 CHECK FOR A SHORT BETWEEN CIRCUIT CPR41 (BU/WH) AND CPR42 (WH) OR CIRCUIT CPR44 (BN/WH) AND CPR45 (VT/GY)

- Measure the resistance between LH PRB motor C3185-5, circuit

Yes

CPR41 (BU/WH) and C3185-1, circuit CPR42 (WH); and between RH PRB motor C3186-5, circuit CPR44 (BN/WH) and C3186-1, circuit CPR45 (VT/GY).  N0040371 • **Are the resistances greater than 10,000 ohms for both measurements?**	GO to D4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
D4 CHECK THE RUNNING BOARD MOTOR FOR AN OPEN CIRCUIT	
• Measure the resistance between LH PRB motor C3185-5, circuit CPR41 (BU/WH), component side and C3185-1, circuit CPR42 (WH), component side or between RH PRB motor C3186-5, circuit CPR44 (BN/WH), component side and C3186-1, circuit CPR45 (VT/GY) component side.  N0055108 • **Is the measured resistance greater than 10,000 ohms?**	**Yes** INSTALL a new PRB motor. REFER to Retractable Running Board Motor in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to D5 .
D5 CHECK THE RUNNING BOARD MOTOR FOR A SHORT TO GROUND	
• Measure the resistance between LH PRB motor C3185-1, circuit CPR 42 (WH), component side or RH motor C3186-1, circuit CPR45 (VT/GY), component side and ground.  N0055109 • **Is the measured resistance greater than 10,000 ohms?**	**Yes** GO to D6 . **No** INSTALL a new PRB motor. REFER to Retractable Running Board Motor in this section. CLEAR the DTCs. REPEAT the self-test.
D6 CHECK THE POWER RUNNING BOARD MODULE FOR CORRECT OPERATION	
• Connect: Power Running Board LH Motor C3185. • Connect: Power Running Board RH Motor C3186. • Visually inspect all PRB module connectors. • Check for: ▪ corrosion.	**Yes** INSTALL a new PRB module. REFER to Retractable Running Board Module in this

■ pushed-out pins. ● Connect all PRB module connectors and make sure they seat correctly. ● Operate the system and verify the concern is still present. ● **Is the concern still present?**	section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: The Retractable Running Board Does Not Operate Correctly — DTC B1162, B1163, B1164 or B1170

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Retractable Running Boards for schematic and connector information.

Normal Operation

The power running board (PRB) module provides a regulated 10-volt power supply to the Hall-effect sensor (internal to the PRB motor) through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module monitors the PRB Hall-effect signal through circuit VPR43 (GY/BU) (LH) or VPR46 (GY/OG) (RH). If the PRB module does not receive any signal from the Hall-effect sensor during operation, the PRB will stop.

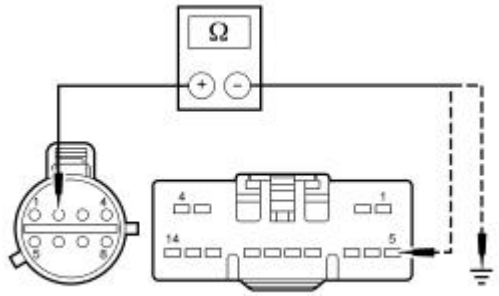
Possible Causes

- Open in circuit CPR47 (GY/BN), RPR47 (BU/GN), VPR43 (GY/BU) or VPR46 (GY/OG)
- Short to ground in circuit VPR43 (GY/BU), VPR46 (GY/OG) or CPR47 (GY/BN)
- Short to battery in circuit VPR43 (GY/BU), VPR46 (GY/OG) or CPR47 (GY/BN)
- PRB module
- LH or RH PRB motor assembly

PINPOINT TEST E: THE RETRACTABLE RUNNING BOARD DOES NOT OPERATE CORRECTLY — DTC B1162, B1163, B1164 OR B1170

Test Step	Result / Action to Take
E1 CHECK CONTINUITY BETWEEN LH AND RH MOTORS ON CIRCUIT CPR47 (GY/BN) AND RPR47 (BU/GN)	
● Disconnect: Power Running Board LH Motor C3185. ● Disconnect: Power Running Board RH Motor C3186. ● Key in OFF position. ● Measure the resistance between LH PRB motor C3185-2, circuit CPR47 (GY/BN) and RH PRB motor C3186-2, circuit CPR47 (GY/BN) harness side; and between LH PRB motor C3185-6, circuit RPR47 (BU/GN) and RH running PRB motor C3186-6, circuit RPR47 (BU/GN) harness side.	**Yes** GO to E2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

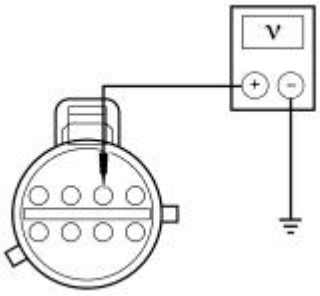
 N0040369 • **Are the resistances less than 5 ohms between the LH and RH PRB motor connectors?**	
E2 CHECK CIRCUIT CPR47 (GY/BN) FOR VOLTAGE AND CIRCUIT RPR47 (BU/GN) FOR GROUND	
• Key in ON position. • Measure the voltage between RH PRB motor C3186-2, circuit CPR47 (GY/BN) and C3186-6, circuit RPR47 (BU/GN).  N0040364 • Open door associated with side tested. • Voltage signal will only be present for approximately one second. • **Is the measured voltage between 7 and 10.5 volts?**	**Yes** GO to E7 . **No** If the voltage was less than 7 volts, GO to E3 . If the voltage was greater than 10.5 volts, GO to E6 .
E3 CHECK CIRCUIT CPR47 (GY/BN) FOR VOLTAGE	
• Measure the voltage between RH PRB motor C3186-2, circuit CPR47 (GY/BN) and ground.  N0040365 • Open door associated with side tested. • Voltage signal will only be present for approximately one second. • **Is the measured voltage between 7 and 10.5 volts?**	**Yes** GO to E5 . **No** GO to E4 .
E4 CHECK CIRCUIT CPR47 (GY/BN) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Power Running Board Module C3313b. • Measure the resistance between RH PRB motor C3186-2, circuit CPR47 (GY/BN) and PRB module C3313b-5, circuit CPR47 (GY/BN); and between RH PRB motor C3186-2, circuit CPR47 (GY/BN) and ground.	**Yes** GO to E9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.



N0055094

- **Is the measured resistance less than 5 ohms and greater than 10,000 ohms to ground?**

E5 CHECK CIRCUIT RPR47 (BU/GN) FOR AN OPEN	
• Key in OFF position. • Disconnect: Power Running Board Module C3313b. • Measure the resistance between RH PRB motor C3186-6, circuit RPR47 (BU/GN) and PRB module C3313b-14, circuit RPR47 (BU/GN).  N0055095 • **Is the measured resistance less than 5 ohms?**	**Yes** GO to E9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E6 CHECK CIRCUIT CPR47 (GY/BN) FOR A SHORT TO BATTERY	
• Key in OFF position. • Disconnect: Power Running Board Module C3313b. • Key in ON position. • Measure the voltage between RH PRB motor C3186-2, circuit CPR47 (GY/BN) and ground.  N0040365 • **Is the measured voltage greater than 10.5 volts?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to E9 .
E7 CHECK FOR A SHORT TO BATTERY IN CIRCUIT VPR43 (GY/BU) OR CIRCUIT VPR46 (GY/OG)	
• Key in OFF position. • Disconnect: Power Running Board Module C3313b. • Key in ON position. • Measure the voltage between LH PRB motor C3185-3, circuit VPR43 (GY/BU) and ground; and between RH PRB motor C3186-3, circuit VPR46 (GY/OG) and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to E8 .



N0040374

- **Is battery voltage present on any of the circuits tested?**

E8 CHECK CIRCUIT VPR43 (GY/BU) AND CIRCUIT VPR46 (GY/OG) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between LH PRB motor C3185-3, circuit VPR43 (GY/BU) and PRB module C3313b-9, circuit VPR43 (GY/BU); and between LH PRB motor C3185-3, circuit VPR43 (GY/BU) and ground.  N0055097 • Measure the resistance between RH PRB motor C3186-3, circuit VPR46 (GY/OG) and PRB module C3313b-10, circuit VPR46 (GY/OG); and between RH PRB motor C3186-3, circuit VPR46 (GY/OG) and ground.  N0055098 • **Are the resistances less than 5 ohms between the LH and RH PRB motor connectors and PRB module; and greater than 10,000 ohms between LH and RH PRB motor connectors and ground?**	**Yes** GO to E10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E9 CHECK THE POWER RUNNING BOARD MODULE FOR CORRECT OPERATION	

• Connect: Power Running Board LH Motor C3185.
• Connect: Power Running Board RH Motor C3186.
• Disconnect all PRB module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all PRB module connectors and make sure they seat correctly.
	Yes
	INSTALL a new PRB module. REFER to Retractable Running Board Module in this section. CLEAR the DTCs. REPEAT the self-test.

• Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
E10 CHECK THE POWER RUNNING BOARD MODULE FOR CORRECT OPERATION	

• Connect: Power Running Board LH Motor C3185.
• Connect: Power Running Board RH Motor C3186.
• Disconnect all PRB module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all PRB module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	GO to E11 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

E11 CHECK THE POWER RUNNING BOARDS FOR FOREIGN MATERIAL	
• **NOTE:** If the system has false bounce back, stops in mid travel, noisy or will not deploy or stow completely, extend the PRB and check to see if any foreign material is caught in the PRB hinge points, step area or door sill. If foreign material is found, clean the PRB hinge points, step area and door sill with a high-pressure washer. If the system operates correctly after cleaning, refer the customer to the owner guide for correct cleaning instructions. • Check the PRB hinge points, step area and door sill of the PRBs for foreign material or blockage. If any foreign material or blockage is found, remove it, and if necessary, set the PRB system to the OUT mode and clean the PRB hinge points, step area and door sill with a high-pressure washer. Avoid direct spray to the motor. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when either door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Do the LH and RH PRBs operate normally during all test steps?**	**Yes** The system is operating normally. The concern may have been caused by foreign material or blockage in the pivot areas or track guides. REFER the customer to the owner guide for correct cleaning instructions. **No** INSTALL a new PRB motor. REFER to Retractable Running Board Motor in this section. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: The Retractable Running Board Does Not Operate Correctly — DTC B2813, B2814, B2816 or B2817

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Retractable Running Boards for schematic and connector information.

Normal Operation

During self-test, the power running board (PRB) module monitors the length of time it takes to deploy and stow the LH and RH PRBs. If the time exceeds 4 seconds, DTC B2813, B2814, B2816 or B2817 will be generated.

Possible Causes

- Mechanical resistance due to foreign material
- LH or RH PRB motor assembly

NOTE: Very cold weather conditions may also affect length of time to stow or deploy PRBs.

PINPOINT TEST F: THE RETRACTABLE RUNNING BOARD DOES NOT OPERATE CORRECTLY — DTC B2813, B2814, B2816 OR B2817

Test Step	Result / Action to Take
F1 CHECK THE OPERATION OF THE POWER RUNNING BOARDS — AUTOMATIC MODE	
• Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when a door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the LH rear door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH rear door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Did both PRBs operate correctly, with no reversal of motion, or noise while in motion?**	**Yes** The system is operating as designed. REVIEW operation of the PRB system with the customer. **No** GO to F2 .
F2 CHECK THE POWER RUNNING BOARDS FOR FOREIGN MATERIAL	
• **NOTE:** If the system has false bounce back, stops in mid travel, noisy or will not deploy or stow completely, extend the PRB and check to see if any foreign material is caught in the PRB hinge points, step area or door sill. If foreign material is found, clean the PRB hinge points, step area and door sill with a high-pressure washer. If the system operates correctly after cleaning, refer the customer to the owner guide for correct cleaning instructions. • Check the PRB hinge points, step area and door sill of the LH and RH PRBs for foreign material or blockage. If any foreign material or blockage is found, remove it, and if necessary, set the PRB system to the OUT mode and clean the PRB hinge points, step area and door sill with a high-pressure washer. Avoid direct spray to the motor. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when a door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door id closed. • **Does the PRB system operate normally during all**	**Yes** The system is operating normally. The concern may have been caused by foreign material or blockage in the PRB hinge points, step area or door sill. REFER the customer to the owner guide for correct cleaning instructions. **No** GO to F3 .

test steps?	
F3 CHECK THE POWER RUNNING BOARD MECHANICAL ASSEMBLY FOR SMOOTH OPERATION	
• Remove the PRB motor. Refer to Retractable Running Board Motor in this section. • With the PRB motor removed, check for smooth movement of PRB mechanical assembly. • **Does the PRB mechanical assembly operate smoothly?**	**Yes** Install a new PRB motor. REFER to Retractable Running Board Motor in this section. CLEAR the DTCs. REPEAT the self-test. **No** Install a new PRB mechanical assembly. REFER to Retractable Running Board in this section. CLEAR the DTCs. REPEAT the self-test.

2	8200	Radiator grille assembly
3	—	Rivets (4 required)
4	—	Radiator grille upper air deflector
5	17D635	Lower radiator grille assembly

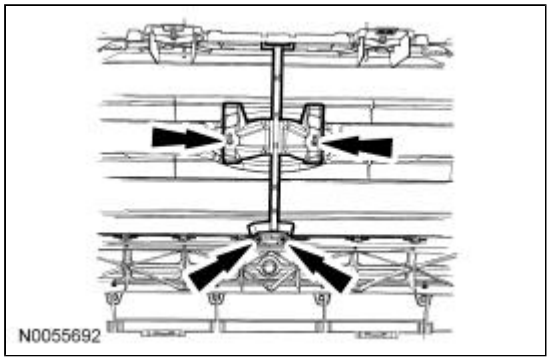
Removal and Installation

All vehicles

1. Remove the front bumper cover. For additional information, refer to Section 501-19 .

Expedition only

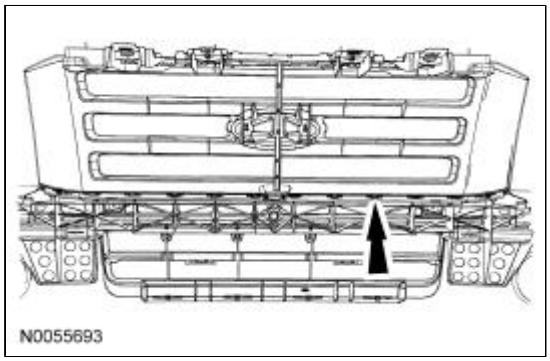
2. Remove the 4 bumper assembly-to-grille bracket retainer nuts and the bumper assembly-to-grille bracket.



All vehicles

3. **NOTE:** Expedition shown, Navigator similar.

   Remove the clips and remove the front grille.

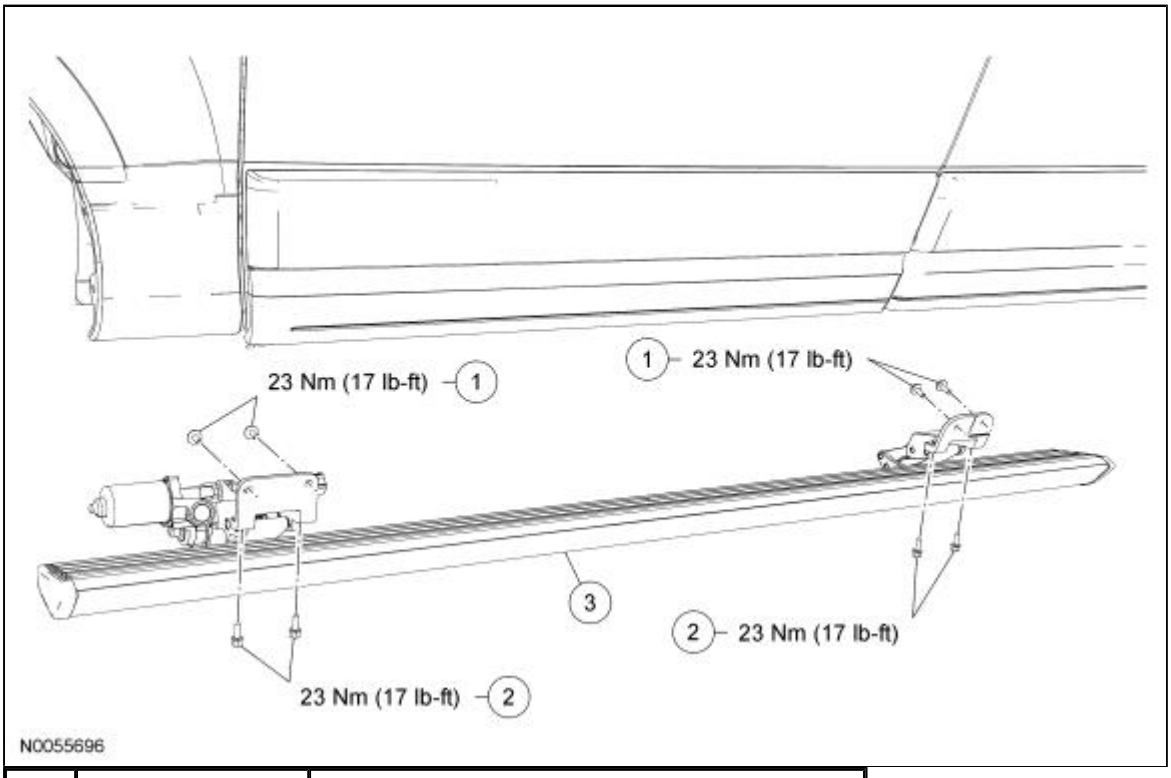


4. To install, reverse the removal procedure.

Retractable Running Board

Printable View (205 KB)

NOTE: LH shown, RH similar.



Item	Part Number	Description
1	W701834	Retractable running board retaining upper bolts (4 required per side)
2	W701834	Retractable running board retaining lower bolts (4 required per side)
3	16B467 LH/ 16B468 RH	Retractable running board assembly

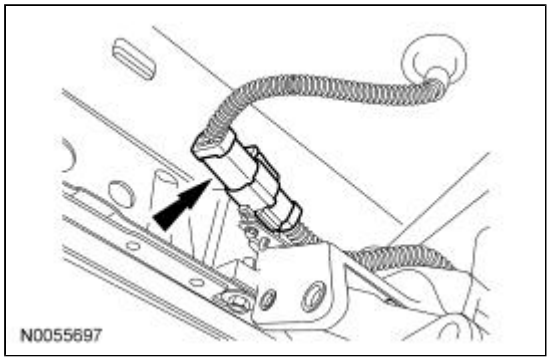
Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** If the retractable running board cannot be extracted, extend the running board by hand.

   Extend the retractable running board.

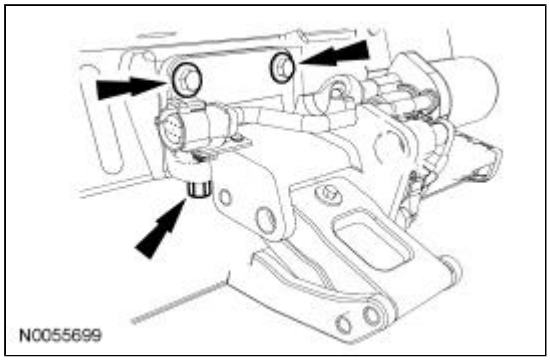
3. Disconnect the retractable running board motor electrical connector.



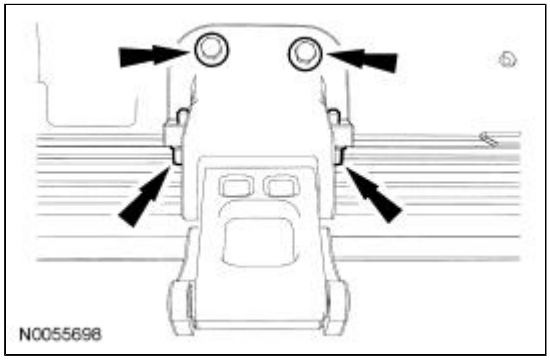
4. **CAUTION: An assistant is required to hold the retractable running board before removing the lower bolts.**

   NOTE: Only 3 bolts shown.

   Remove the front retractable running board upper and lower bolts.
   - To install, tighten to 23 Nm (17 lb-ft).



5. Remove the rear retractable running board upper and lower bolts and remove the retractable running board assembly.
   - To install, tighten to 23 Nm (17 lb-ft).



6. To install, reverse the removal procedure.

Retractable Running Board Motor

General Specifications

Item	Specification
Rear View Mirror Adhesive TA-17	—

Torque Specifications

Description	Nm	lb-in
Exterior mirror nuts	7	62

Rear View Mirrors

Printable View (63 KB)

The rear view mirror components consist of:

- the interior mirror.
- the auto-dimming mirror (optional).
- the exterior power folding mirror (optional).
- the exterior mirror.
- the exterior mirror glass.
- the exterior mirror cover.
- the exterior mirror motor.
- the exterior mirror control switch.
- the memory set switch.

The interior mirror:

- is windshield mounted.
- is a manually-positioned day/night or an optional auto-dimming interior mirror.

The exterior mirrors:

- are controlled by power controls on the LH front door trim panel.
- are of a fold-away design.
- may contain turn signal indicators.
- may contain puddle or approach lamps.
- may be heated when the heated back window glass is activated.
- may have a programmable recall memory option.
- may have a power fold feature.

If equipped with power folding mirrors, they must be synchronized any time the mirrors are folded or unfolded without using the mirror control switch, or if a new power folding mirror has been installed. Refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

Rear View Mirrors

Printable View (433 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057

Principles of Operation

Auto-Dimming Interior Mirror

The interior rear view mirror may be equipped with an auto-dimming option. This feature automatically reduces the glare caused by headlamps reflecting in the mirror. The auto-dimming feature is disabled when the vehicle is in REVERSE. Power is supplied to the auto-dimming interior mirror when the ignition is in the RUN or ACC position.

The auto-dimming interior mirror has 2 photoelectric sensors that detect forward and rear light conditions. Based on these inputs, the automatic dimming feature adjusts the reflectance level of the mirror glass to eliminate unwanted glare. The reflectance level of the mirror glass is variable and depends on the amount of rear glare in relation to ambient light conditions in front of the interior mirror.

When the forward sensor detects daytime conditions, the rear sensor is inactive and the mirror stays in a high reflectance mode. When the forward sensor detects nighttime conditions, the rear sensor is active and detects glare from the headlights of vehicles approaching from the rear or other glare-producing light sources. To provide increased visibility when backing up, the mirror will automatically return to a high reflectance mode whenever the shifter is placed in REVERSE.

If the forward or rear sensors are blocked, the automatic dimming interior mirror might not work correctly.

Driver Seat Module

The power driver seat and power exterior mirrors are controlled by the driver seat module (DSM) only when the vehicle is equipped with the programmable/recall memory option.

On the Expedition Limited, the power fold exterior mirror option is controlled by the DSM. Before running a self-test or retrieving codes, the power fold switch must be inactive for at least 30 seconds.

The DSM system consists of the following components:

- DSM
- Driver memory seat switch
- Memory mirror switch
- Memory set switch
- Front vertical seat motor
- Rear vertical seat motor
- Driver horizontal seat motor

- Memory tilt column
- LH memory mirror
- RH memory mirror
- LH power fold motor
- RH power fold motor

The DSM incorporates multiple functions into one module and offers diagnostics to easily locate and repair concerns affecting the subsystems that it controls. If equipped with heated memory mirrors, the heated glass portion of the memory mirror is controlled by the heated back window system and is not monitored by the DSM for electrical concerns.

Power Exterior Mirror Operation Without Memory

The power exterior mirrors are controlled by the power exterior mirror switch and are operational all the time, whether the ignition switch is on or off. Using the power exterior mirror switch, the driver can adjust the driver and passenger exterior mirrors 4 ways.

Up/Down Motion

The power exterior mirrors can be moved up and down under motor control by actuating the power mirrors up/down switch. The power mirror control switch will power the driver or passenger mirror up/down motor until the switch is released or until the travel limit is reached.

Left/Right Motion

The power exterior mirrors can be moved left and right under motor control by actuating the power mirrors left/right switch. The power mirror control switch will power the driver or passenger mirror left/right motor until the switch is released or until the travel limit is reached.

Power Exterior Mirror Operation With Memory

The memory power exterior mirrors feature allows the driver to program personalized mirror positions that can be recalled using the memory switches or remote transmitter. There are 2 memory settings possible. The power driver seat positions are also stored and recalled with the memory exterior mirror positions.

The power exterior mirrors are controlled by the DSM and are operational all the time, whether the ignition switch is on or off. Using the power exterior mirror switch, the driver can adjust the driver and passenger exterior mirrors 4 ways.

Up/Down Motion

The power exterior mirrors can be moved up and down under motor control by actuating the power mirrors up/down switch. The DSM will power the driver or passenger mirror up/down motor until the switch is released or until the travel limit is reached.

Left/Right Motion

The power exterior mirrors can be moved left and right under motor control by actuating the power mirrors left/right switch. The DSM will power the driver or passenger mirror left/right motor until the switch is released or until the travel limit is reached.

Mirror Selection — Driver/Passenger

The driver can select the driver or passenger mirror to be adjusted by setting the mirror select switch to the appropriate position.

Turn Signal Mirror

The exterior mirror may be equipped with a mirror-mounted turn signal assembly. For Diagnosis and Testing or service procedures, refer to Section 417-01 .

Puddle/Approach Lamps

The exterior mirrors may be equipped with approach or puddle lamps, which will illuminate when the interior lights are turned on by opening a door or by pressing the unlock button on the remote transmitter, if equipped. For diagnosis and testing of the puddle or approach lamps, refer to Section 417-02 .

Power Folding Exterior Mirrors

Power Folding Mirrors

The power folding exterior mirrors are controlled by the driver seat module (DSM). The power folding mirror switch, which is integral to the exterior mirror control switch, sends a signal to the DSM which then supplies power and ground to the exterior mirrors to extend or retract the mirrors.

If the power folding mirrors have been folded or unfolded without using the mirror switch, they must be synchronized. Refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

Inspection and Verification

1. Verify the customer concern by operating the power exterior mirrors or memory mirrors.

2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Exterior mirror(s) • Interior mirror	• Central junction box (CJB) fuse 3 (7.5A) • Circuitry • Exterior mirror control switch • Exterior mirror motor • Interior mirror • Driver seat module (DSM) • Memory set switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to Section 418-00 to diagnose no response from the driver seat module (DSM).

7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the DSM.

9. If the DTCs retrieved are related to the concern, go to Driver Seat Module (DSM) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The mirrors are inoperative	• Fuse • Circuitry open/shorted • Exterior mirror control switch	• Go To Pinpoint Test A .

• A single mirror is inoperative	• Circuitry open • Exterior mirror control switch • Exterior mirror motor • Exterior mirror	• Go To Pinpoint Test B .
• A single mirror does not function with switch logic	• Circuitry open/shorted • Exterior mirror motor • Exterior mirror control switch • Exterior mirror	• CARRY OUT the exterior mirror control switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. If the switch tests OK, Go To Pinpoint Test C .
• The memory mirror is inoperative	• Circuitry open/shorted • Fuse • Exterior mirror control switch • Exterior mirror motor • Exterior mirror	• Go To Pinpoint Test D .
• The power folding mirrors do not operate	• Circuitry open/shorted • Exterior mirror control switch • Exterior mirror • Driver seat module (DSM)	• Go To Pinpoint Test E .
• The heated mirror does not defrost	• Circuitry open • Exterior mirror glass	• Go To Pinpoint Test F .

• The auto-dimming mirror does not operate correctly	• Obstructed rear-facing sensor:
	  ▪ Stickers, window decals, tags
	  ▪ Non-OEM window tinting
	• Obstructed forward-facing sensor:
	  ▪ Stickers, window decals, tags
	  ▪ Non-OEM window tinting
		• If possible, REMOVE the obstruction. If the obstruction cannot be removed, Go To Pinpoint Test G to test the auto-dimming mirror for correct function.

	• Light source near or inside of vehicle	• None. Any light source the rear-facing sensor is exposed to can be considered glare.
	• Vehicle inside garage or tunnel	• None. Ambient light conditions are similar to nighttime.
	• Circuitry open • Auto-dimming	• Go To Pinpoint Test G .

	interior mirror	

Pinpoint Tests

Pinpoint Test A: The Mirrors Are Inoperative

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

NOTE: For vehicles with memory mirrors, Go To Pinpoint Test D .

Normal Operation

The exterior mirror control switch receives power through circuit SBP12 (GN/RD) and ground through circuit GD143 (BK/VT). The exterior mirror control switch uses circuit CPM23 (GY) as the common circuit for both exterior mirror up/down and right/left movement.

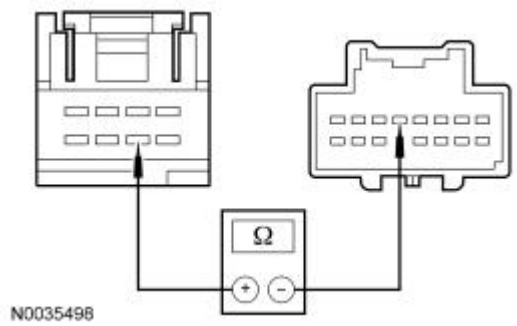
Possible Causes

- Fuse
- An open in circuits CPM23 (GY), SBP12 (GN/RD) or GD143 (BK/VT)
- A short to ground in circuit CPM23 (GY)
- A short to voltage in circuit CPM23 (GY)
- Exterior mirror control switch

PINPOINT TEST A: THE MIRRORS ARE INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK THE VOLTAGE TO THE EXTERIOR MIRROR CONTROL SWITCH — CIRCUIT SBP12 (GN/RD)	
• Key in OFF position. • Disconnect: Exterior Mirror Control Switch C527. • Key in ON position. • Measure the voltage between ground and exterior mirror control switch C527-1, circuit SBP12 (GN/RD).  • **Is the voltage greater than 10 volts?**	**Yes** GO to A2 . **No** VERIFY smart junction box (SJB) fuse 12 (7.5A) is OK. If OK, REPAIR circuit SBP12 (GN/RD) for an open. TEST the system for normal operation.
A2 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between ground and exterior mirror control switch C527-3, circuit GD143 (BK/VT).	**Yes** GO to A3 . **No** REPAIR circuit GD143

 A0081902 • **Is the resistance less than 5 ohms?**	(BK/VT) for an open. TEST the system for normal operation.
A3 CHECK CIRCUIT CPM23 (GY) FOR A SHORT TO VOLTAGE • Key in ON position. • Measure the voltage between ground and exterior mirror control switch C527-6, circuit CPM23 (GY).  A0073142 • **Is voltage indicated?**	**Yes** REPAIR circuit CPM23 (GY) for a short to voltage. TEST the system for normal operation. **No** GO to A4 .
A4 CHECK CIRCUIT CPM23 (GY) FOR A SHORT TO GROUND • Key in OFF position. • Measure the resistance between ground and exterior mirror control switch C527-6, circuit CPM23 (GY).  A0073143 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A5 . **No** REPAIR circuit CPM23 (GY) for a short to ground. TEST the system for normal operation.
A5 CHECK CIRCUIT CPM23 (GY) FOR AN OPEN • Disconnect: LH Exterior Mirror C516. • Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY) and LH exterior mirror C516-4, circuit CPM23 (GY) harness side.	**Yes** INSTALL a new exterior mirror control switch. REFER to Exterior Mirror Control Switch in this section. TEST the system for normal operation. **No** REPAIR circuit CPM23 (GY) for an open. TEST the system for normal operation.



- **Is the resistance less than 5 ohms?**

Pinpoint Test B: A Single Mirror is Inoperative

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

NOTE: For vehicles with memory mirrors, Go To Pinpoint Test D .

Normal Operation

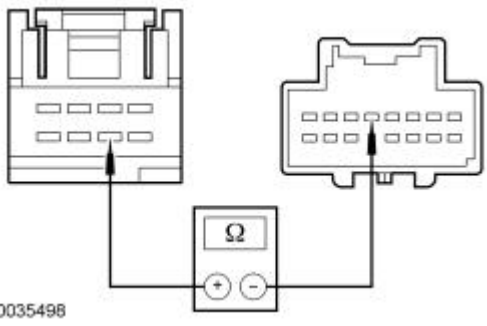
The exterior mirror control switch uses circuit CPM23 (GY) as the common circuit for both exterior mirror up/down and right/left movement.

Possible Causes

- An open in circuit CPM23 (GY)
- Exterior mirror control switch
- Exterior mirror motor
- Exterior mirror

PINPOINT TEST B: A SINGLE MIRROR IS INOPERATIVE

Test Step	Result / Action to Take
B1 CHECK THE LH EXTERIOR MIRROR	
• Set the exterior mirror control switch to the LH mirror position. • Use the exterior mirror control switch to operate the LH exterior mirror. • **Does the LH exterior mirror operate?**	**Yes** GO to B2 . **No** GO to B4 .
B2 CHECK CIRCUIT CPM23 (GY) FOR AN OPEN	
• Key in OFF position. • Disconnect: LH Exterior Mirror C516. • Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY) and LH exterior mirror C516-4, circuit CPM23 (GY).	**Yes** GO to B3 . **No** REPAIR circuit CPM23 (GY) for an open. TEST the system for normal operation.



- **Is the resistance less than 5 ohms?**

B3 CHECK THE EXTERIOR MIRROR CONTROL SWITCH	
• Carry out the exterior mirror control switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the exterior mirror control switch OK?**	**Yes** CHECK the RH exterior mirror jumper harness between the vehicle harness and the RH exterior mirror motor for open or shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, INSTALL a new RH mirror. REFER to Exterior Mirror in this section. Otherwise, INSTALL a new RH exterior mirror motor. REFER to Exterior Mirror Motor in this section. TEST the system for normal operation. **No** INSTALL a new exterior mirror control switch. REFER to Exterior Mirror Control Switch in this section. TEST the system for normal operation.
B4 CHECK CIRCUIT CPM23 (GY) FOR AN OPEN	
• Key in OFF position. • Disconnect: LH Exterior Mirror C516. • Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY) and LH exterior mirror C516-4, circuit CPM23 (GY) harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR circuit CPM23 (GY) for an open. TEST the system for normal operation.
B5 CHECK THE EXTERIOR MIRROR CONTROL SWITCH	
• Carry out the exterior mirror control switch component test.	**Yes** CHECK the LH exterior mirror jumper harness between the vehicle harness and the LH exterior mirror motor for

Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the exterior mirror control switch OK?**	open or shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, INSTALL a new LH mirror. REFER to Exterior Mirror in this section. Otherwise, INSTALL a new LH exterior mirror motor. REFER to Exterior Mirror Motor in this section. TEST the system for normal operation. **No** INSTALL a new exterior mirror control switch. REFER to Exterior Mirror Control Switch in this section. TEST the system for normal operation.

Pinpoint Test C: A Single Mirror Does Not Function With Switch Logic

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

NOTE: For vehicles equipped with memory mirrors, Go To Pinpoint Test D .

Normal Operation

The exterior mirror control switch uses circuits CPM16 (BN/BU), CPM17 (BU/GN) and CPM23 (GY) to control LH exterior mirror movement. For the RH exterior mirror, the exterior mirror switch uses circuits CPM20 (BN/WH), CPM21 (YE/VT) and CPM23 (GY) to control the exterior mirror movement.

Mirror Movement

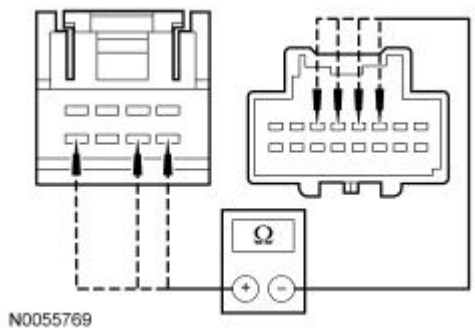
- When ground is received through circuit CPM16 (BN/BU)/CPM20 (BN/WH) and power through circuit CPM23 (GY), the LH/RH exterior mirror will operate left.
- When power is received through circuit CPM16 (BN/BU)/CPM20 (BN/WH) and ground through circuit CPM23 (GY), the LH/RH exterior mirror will operate right.
- When ground is received through circuit CPM17 (BU/GN)/CPM21 (YE/VT) and power through circuit CPM23 (GY), the LH/RH exterior mirror will operate up.
- When power is received through circuit CPM17 (BU/GN)/CPM21 (YE/VT) and ground through circuit CPM23 (GY), the LH/RH exterior mirror will operate down.

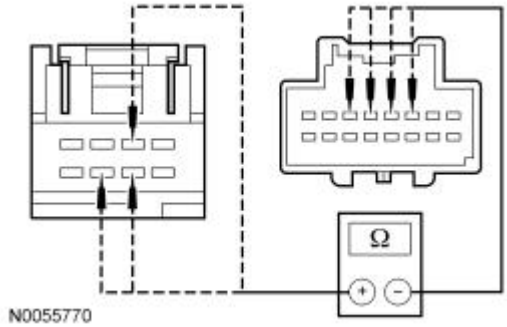
Possible Causes

- An open in circuits CPM16 (BN/BU), CPM17 (BU/GN), CPM20 (BN/WH), CPM21 (YE/VT) or CPM23 (GY)
- A short to ground in circuits CPM16 (BN/BU), CPM17 (BU/GN), CPM20 (BN/WH), CPM21 (YE/VT) or CPM23 (GY)
- A short to voltage in circuits CPM16 (BN/BU), CPM17 (BU/GN), CPM20 (BN/WH), CPM21 (YE/VT) or CPM23 (GY)
- Exterior mirror motor
- Exterior mirror

PINPOINT TEST C: A SINGLE MIRROR DOES NOT FUNCTION WITH SWITCH LOGIC

Test Step	Result / Action to Take
C1 CHECK THE EXTERIOR MIRROR CONTROL CIRCUITS FOR AN OPEN	

• Key in OFF position.
• Disconnect: Inoperative Exterior Mirror (LH) C516/(RH) C622.
• **NOTE:** LH only.
• Measure the resistance between exterior mirror control switch:
  ▪ C527-6, circuit CPM23 (GY) and LH exterior mirror C516-4, circuit CPM23 (GY).
  ▪ C527-6, circuit CPM23 (GY) and LH exterior mirror C516-5, circuit CPM23 (GY).
  ▪ C527-8, circuit CPM16 (BN/BU) and LH exterior mirror C516-6, circuit CPM16 (BN/BU).
  ▪ C527-5, circuit CPM17 (BN/GN) and LH exterior mirror C516-3, circuit CPM17 (BN/GN).
  	


N0055769
• **NOTE:** RH only.
• Measure the resistance between exterior mirror control switch:
  ▪ C527-6, circuit CPM23 (GY) and RH exterior mirror C622-4, circuit CPM23 (GY).
  ▪ C527-6, circuit CPM23 (GY) and RH exterior mirror C622-5, circuit CPM23 (GY).
  ▪ C527-7, circuit CPM20 (BN/WH) and RH exterior mirror C622-6, circuit CPM20 (BN/WH).
  ▪ C527-2, circuit CPM21 (YE/VT) and RH exterior mirror C622-3, circuit CPM21 (YE/VT).
  	


N0055770
• **Are the resistances less than 5 ohms?**
	Yes
	GO to C2 .
	
	No
	REPAIR the circuit(s) for an open. TEST the system for normal operation.

C2 CHECK THE EXTERIOR MIRROR CONTROL CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between ground and	**Yes**

exterior mirror control switch: ■ C527-8, circuit CPM16 (BN/BU). ■ C527-5, circuit CPM17 (BU/GN). ■ C527-6, circuit CPM23 (GY). ■ C527-7, circuit CPM20 (BN/WH). ■ C527-2, circuit CPM21 (YE/VT).  N0055771 • **Are the resistances greater than 10,000 ohms?**	GO to C3 . **No** REPAIR the circuit(s) for a short to ground. TEST the system for normal operation.
C3 CHECK THE EXTERIOR MIRROR CONTROL CIRCUITS FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between ground and exterior mirror control switch: ■ C527-8, circuit CPM16 (BN/BU). ■ C527-5, circuit CPM17 (BU/GN). ■ C527-6, circuit CPM23 (GY). ■ C527-7, circuit CPM20 (BN/WH). ■ C527-2, circuit CPM21 (YE/VT).  N0055772 • **Is any voltage indicated?**	**Yes** REPAIR the circuit(s) for a short to voltage. TEST the system for normal operation. **No** CHECK the suspect exterior mirror jumper harness between the vehicle harness and the suspect exterior mirror motor for open or shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, INSTALL a new exterior mirror. REFER to Exterior Mirror in this section. Otherwise, INSTALL a new exterior mirror motor. INSTALL a new exterior rear view mirror motor. REFER to Exterior Mirror Motor in this section. TEST the system for normal operation.

Pinpoint Test D: The Memory Mirror is Inoperative

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

Normal Operation

Under normal operation, the exterior mirror control switch receives power from circuit SBP12 (GN/RD) and ground from circuit GD133 (BK). The exterior mirror control switch sends input to the driver seat module (DSM) for the LH exterior mirror by switching power and ground to circuits CPM15 (VT/OG), CPM14 (GY/BN) and CPM23 (GY) and for the RH exterior mirror by switching power and ground to circuits CPM19 (GY/OG), CPM18 (GN/BN) and CPM23 (GY). The DSM will then send the appropriate power and ground for the LH exterior mirror motor up/down circuits CPM29 (GN), CPM26 (WH) and left/right circuits CPM28 (BU/BN) and CPM27 (GY/BU) or the RH exterior mirror motor up/down circuits CPM34 (WH/BN), CPM31 (YE/GY) and left/right circuits CPM32 (WH/BU), CPM33 (WH/VT).

The DSM supplies the LH and RH exterior mirror feedback potentiometer reference voltage through circuit LPP06 (YE/BU) and ground through circuit RPP06 (GN). The DSM recieves feedback from the LH exterior mirror feedback potentiometer through circuit (up/down) VPM35 (YE/BU) and circuit (left/right) VPM36 (BN/YE).The DSM recieves feedback from the RH exterior mirror feedback potentiometer through circuit (up/down) VPM37 (WH/BU) and circuit (left/right) VPM38 (BN/GN).

Possible Causes

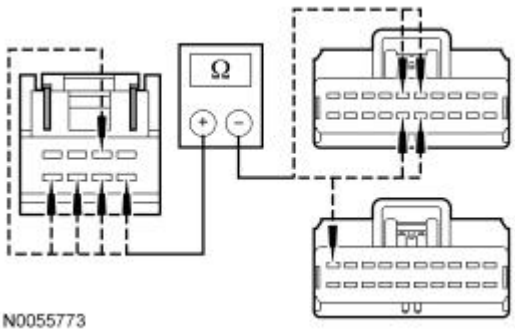
- Fuse
- An open in circuits SBP12 (GN/RD), GD133 (BK), CPM18 (GN/BN), CPM15 (VT/OG), CPM23 (GY), CPM19 (GY/OG), CPM14 (GY/BN), CPM32 (WH/BU), CPM33 (WH/VT), CPM34 (WH/BN), CPM31 (YE/GY), CPM26 (WH), CPM27 (GY/BU), CPM28 (BU/BN), CPM29 (GN),VPM35 (YE/BU), VPM36 (BN/YE), VPM37 (BU/OG), VPM38 (BN/GN), LPP06 (YE/BU) or RPP06 (GN)
- A short to ground in circuits: CPM18 (GN/BN), CPM15 (VT/OG), CPM23 (GY), CPM19 (GY/OG), CPM14 (GY/BN), CPM32 (WH/BU), CPM33 (WH/VT), CPM34 (WH/BN), CPM31 (YE/GY), CPM26 (WH), CPM27 (GY/BU), CPM28 (BU/BN), CPM29 (GN),VPM35 (YE/BU), VPM36 (BN/YE), VPM37 (BU/OG), VPM38 (BN/GN), LPP06 (YE/BU) or RPP06 (GN)
- A short to voltage in circuits CPM18 (GN/BN), CPM15 (VT/OG), CPM23 (GY), CPM19 (GY/OG), CPM14 (GY/BN), CPM32 (WH/BU), CPM33 (WH/VT), CPM34 (WH/BN), CPM31 (YE/GY), CPM26 (WH), CPM27 (GY/BU), CPM28 (BU/BN), CPM29 (GN),VPM35 (YE/BU), VPM36 (BN/YE), VPM37 (BU/OG), VPM38 (BN/GN), LPP06 (YE/BU) or RPP06 (GN)
- A short together in circuits CPM18 (GN/BN), CPM15 (VT/OG), CPM23 (GY), CPM19 (GY/OG), CPM14 (GY/BN), CPM32 (WH/BU), CPM33 (WH/VT), CPM34 (WH/BN), CPM31 (YE/GY), CPM26 (WH), CPM27 (GY/BU), CPM28 (BU/BN), CPM29 (GN),VPM35 (YE/BU), VPM36 (BN/YE), VPM37 (BU/OG), VPM38 (BN/GN), LPP06 (YE/BU) or RPP06 (GN)
- Exterior mirror control switch
- Exterior mirror motor
- Exterior mirror

PINPOINT TEST D: THE MEMORY MIRROR IS INOPERATIVE

Test Step	Result / Action to Take
D1 RETRIEVE THE DTCs FROM DRIVER SEAT MODULE (DSM)	
• Use the recorded DSM DTCs from the continuous and on-demand self tests. • **Are any DTCs retrieved?**	**Yes** If DTC B1735, B1739, B1743 or B1747, CARRY OUT the exterior mirror control switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. If the switch tests OK, GO to D7 . If DTC B1632, B1636, B1774, B1779, B1640, B1644, B1783 or B1787, GO to D8 . If DTC B1633, B1637, B1775, B1780, B1641, B1645, B1784 or B1788, GO to D9 . If DTC B1634, B1638, B1776, B1781, B1642, B1646, B1785 or B1789, GO to D10 . If DTC B2316, B2312, B2324 or B2320, GO to D12 . If DTC B2318, B2314, B2326 or B2322, GO to D14 . If DTC B1669 or B1670 or if other DTCs are present diagnose them first. If no other DTCs are present, INSPECT the exterior mirror motor for foreign material, damage or a binding condition. If no condition is found, INSTALL a new

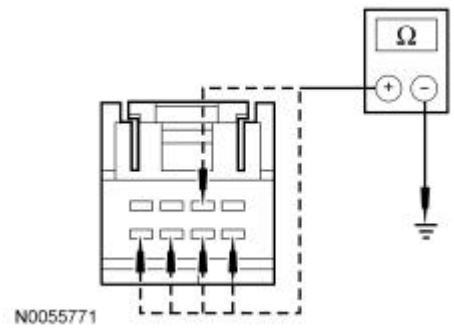
	RH exterior mirror motor. REFER to Exterior Mirror Motor in this section. CLEAR the DTCs. TEST the system for normal operation. If DTC B1667 or B1668 or if other DTCs are present diagnose them first. If no other DTCs are present, INSPECT the exterior mirror motor for foreign material, damage or a binding condition. If no condition is found, INSTALL a new LH exterior mirror motor. REFER to Exterior Mirror Motor in this section. CLEAR the DTCs. TEST the system for normal operation. **No** CARRY OUT the exterior mirror control switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. If the switch tests OK, GO to D2.
D2 CHECK CIRCUIT SBP12 (GN/RD) FOR VOLTAGE • Key in OFF position. • Disconnect: Exterior Mirror Control Switch C527. • Key in ON position. • Measure the voltage between ground and exterior mirror control switch C527-1, circuit SBP12 (GN/RD).  A0081901 • **Is the voltage greater than 10 volts?**	**Yes** GO to D3. **No** VERIFY smart junction box (SJB) fuse 12 (7.5A) is OK. If OK, REPAIR circuit SBP12 (GN/RD) for an open. CLEAR the DTCs. TEST the system for normal operation.
D3 CHECK CIRCUIT GD133 (BK) FOR AN OPEN • Key in OFF position. • Measure the resistance between ground and exterior mirror control switch C527-3, circuit GD133 (BK).  A0081902 • **Is the resistance less than 5 ohms?**	**Yes** CARRY OUT the exterior mirror control switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. If the switch tests OK, GO to D4. **No** REPAIR circuit GD133 (BK) for an open. CLEAR the DTCs. TEST the system for normal operation.

D4 CHECK CIRCUITS CPM18 (GN/BN), CPM14 (GY/BN), CPM19 (GY/OG), CPM15 (VT/OG) AND CPM23 (GY) FOR AN OPEN	

• Disconnect: Driver Seat Module (DSM) C341c and C341e.
• Measure the resistance between exterior mirror control switch:
  ▪ C527-2, circuit CPM18 (GN/BN) and DSM C341e-5, circuit CPM18 (GN/BN).
  ▪ C527-5, circuit CPM14 (GY/BN) and DSM C341e-15, circuit CPM14 (GY/BN).
  ▪ C527-6, circuit CPM23 (GY) and DSM C341e-6, circuit CPM23 (GY).
  ▪ C527-8, circuit CPM15 (VT/OG) and DSM C341e-18, circuit CPM15 (VT/OG).
  ▪ C527-7, circuit CPM19 (GY/OG) and DSM C341c-10, circuit CPM19 (GY/OG).
  	


• **Are the resistances less than 5 ohms?**
	Yes
	GO to D5 .
	
	No
	REPAIR the circuit(s) for an open. CLEAR the DTCs. TEST the system for normal operation.

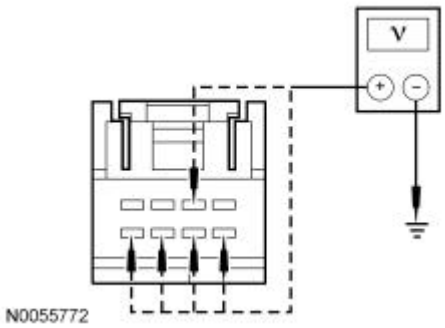
D5 CHECK CIRCUITS CPM18 (GN/BN), CPM14 (GY/BN), CPM19 (GY/OG), CPM15 (VT/OG) AND CPM23 (GY) FOR A SHORT TO GROUND	

• Key in OFF position.
• Measure the resistance between ground and exterior mirror control switch:
  ▪ C527-2, circuit CPM18 (GN/BN).
  ▪ C527-5, circuit CPM14 (GY/BN).
  ▪ C527-6, circuit CPM23 (GY).
  ▪ C527-8, circuit CPM15 (VT/OG).
  ▪ C527-7, circuit CPM19 (GY/OG).
  	


• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to D6 .
	
	No
	REPAIR the circuit(s) for a short to ground. CLEAR the DTCs. TEST the system for normal operation.

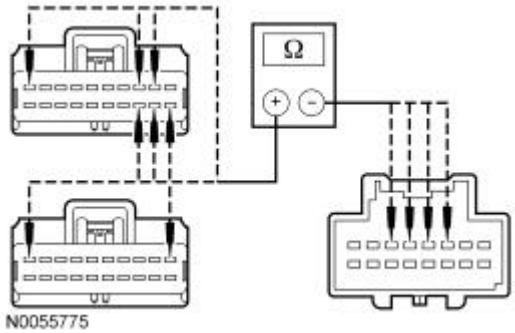
D6 CHECK CIRCUITS CPM18 (GN/BN), CPM14 (GY/BN), CPM19 (GY/OG), CPM15 (VT/OG) AND CPM23 (GY) FOR A SHORT TOGETHER	
• Measure the resistance between exterior mirror	**Yes**

control switch: ■ C527-2, circuit CPM18 (GN/BN) and C527-5, CPM14 (GY/BN). ■ C527-2, circuit CPM18 (GN/BN) and C527-6, CPM23 (GY). ■ C527-2, circuit CPM18 (GN/BN) and C527-7, CPM19 (GY/OG). ■ C527-2, circuit CPM18 (GN/BN) and C527-8, CPM15 (VT/OG). ■ C527-5, CPM14 (GY/BN) and C527-6, CPM23 (GY). ■ C527-5, CPM14 (GY/BN) and C527-7, CPM19 (GY/OG). ■ C527-5, CPM14 (GY/BN) and C527-8, CPM15 (VT/OG). ■ C527-6, CPM23 (GY) and C527-7, CPM19 (GY/OG). ■ C527-6, CPM23 (GY) and C527-8, CPM15 (VT/OG). ■ C527-7, CPM19 (GY/OG) and C527-8, CPM15 (VT/OG).  N0055774 • **Are the resistances greater than 10,000 ohms?**	CHECK the exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open or shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, INSTALL a new mirror. REFER to Exterior Mirror in this section. Otherwise, INSTALL a new exterior mirror motor. REFER to Exterior Mirror Motor in this section. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the circuits for a short together. CLEAR the DTCs. TEST the system for normal operation.
D7 CHECK CIRCUITS CPM18 (GN/BN), CPM14 (GY/BN), CPM19 (GY/OG), CPM15 (VT/OG) AND CPM23 (GY) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Exterior Mirror Control Switch C527. • Disconnect: Driver Seat Module (DSM) C341c and C341e. • Key in ON position. • Measure the voltage between ground and exterior mirror control switch: ■ C527-2, circuit CPM18 (GN/BN). ■ C527-5, circuit CPM14 (GY/BN). ■ C527-6, circuit CPM23 (GY). ■ C527-8, circuit CPM15 (VT/OG). ■ C527-7, circuit CPM19 (GY/OG).	**Yes** REPAIR the circuit(s) for a short to voltage. CLEAR the DTCs. TEST the system for normal operation. **No** CHECK the exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open or shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, INSTALL a new mirror. REFER to Exterior Mirror in this section. Otherwise, INSTALL a new exterior mirror motor. REFER to Exterior Mirror Motor in this section. CLEAR the DTCs. TEST the system for normal operation.



- **Is voltage indicated?**

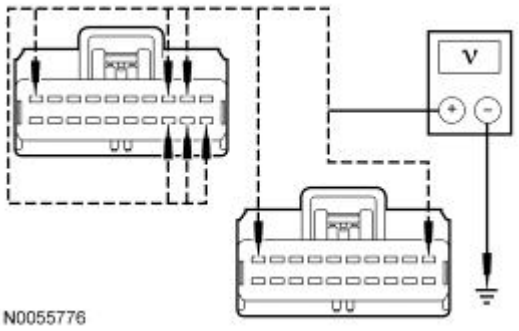
D8 CHECK CIRCUITS CPM26 (WH), CPM29 (GN), CPM28 (BU/BN), CPM27 (GY/BU), CPM34 (WH/BN), CPM31 (YE/GY), CPM32 (WH/BU) AND CPM33 (WH/VT) FOR AN OPEN	

• Key in OFF position.
• Disconnect: Exterior Mirror (LH) C516 or (RH) C622.
• Disconnect: Driver Seat Module (DSM) C341d and C341e.
• Measure the resistance between DSM:
  ▪ (DTC B1779) C341d-1, circuit CPM26 (WH) and LH exterior mirror C516-4, circuit CPM26 (WH).
  ▪ (DTC B1774) C341e-3, circuit CPM29 (GN) and LH exterior mirror C516-3, circuit CPM29 (GN).
  ▪ (DTC B1636) C341e-10, circuit CPM28 (BU/BN) and LH exterior mirror C516-6, circuit CPM28 (BU/BN).
  ▪ (DTC B1632) C341e-13, circuit CPM27 (GY/BU) and LH exterior mirror C516-5, circuit CPM27 (GY/BU).
  ▪ (DTC B1783) C341d-10, circuit CPM34 (WH/BN) and RH exterior mirror C622-3, circuit CPM34 (WH/BN).
  ▪ (DTC B1787) C341e-2, circuit CPM31 (YE/GY) and RH exterior mirror C622-4, circuit CPM31 (YE/GY).
  ▪ (DTC B1640) C341e-12, circuit CPM32 (WH/BU) and RH exterior mirror C622-5, circuit CPM32 (WH/BU).
  ▪ (DTC B1644) C341e-11, circuit CPM33 (WH/VT) and RH exterior mirror C622-6, circuit CPM33 (WH/VT).
  	


• **Is the resistance less than 5 ohms?**
	Yes
	CHECK the exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open or shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, INSTALL a new mirror. REFER to Exterior Mirror in this section. Otherwise, INSTALL a new exterior mirror motor. REFER to Exterior Mirror Motor in this section. CLEAR the DTCs. TEST the system for normal operation.
	
	No
	REPAIR the circuit(s) for an open. CLEAR the DTCs. TEST the system for normal operation.

D9 CHECK CIRCUITS CPM26 (WH), CPM29 (GN),	

CPM28 (BU/BN), CPM27 (GY/BU), CPM34 (WH/BN), CPM31 (YE/GY), CPM32 (WH/BU) AND CPM33 (WH/VT) FOR A SHORT TO VOLTAGE	

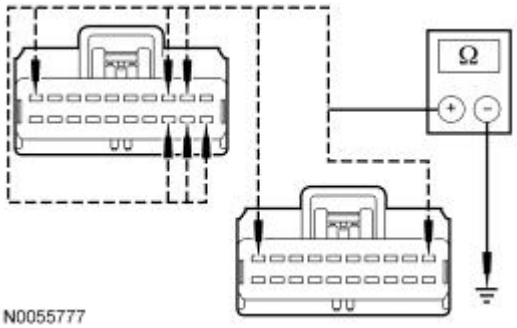
• Key in OFF position.
• Disconnect: Exterior Mirror (LH) C516 or (RH) C622.
• Disconnect: Driver Seat Module (DSM) C341d and C341e.
• Key in ON position.
• Measure the voltage between ground and DSM:
  ▪ (DTC B1780) C341d-1, circuit CPM26 (WH).
  ▪ (DTC B1775) C341e-3, circuit CPM29 (GN).
  ▪ (DTC B1637) C341e-10, circuit CPM28 (BU/BN).
  ▪ (DTC B1633) C341e-13, circuit CPM27 (GY/BU).
  ▪ (DTC B1784) C341d-10, circuit CPM34 (WH/BN).
  ▪ (DTC B1788) C341e-2, circuit CPM31 (YE/GY).
  ▪ (DTC B1641) C341e-12, circuit CPM32 (WH/BU).
  ▪ (DTC B1645) C341e-11, circuit CPM33 (WH/VT).
  	


• **Is voltage indicated?**
	Yes
	REPAIR the circuit(s) for a short to voltage. CLEAR the DTCs. TEST the system for normal operation.
	
	No
	GO to D11 .

D10 CHECK CIRCUITS CPM26 (WH), CPM29 (GN), CPM28 (BU/BN), CPM27 (GY/BU), CPM34 (WH/BN), CPM31 (YE/GY), CPM32 (WH/BU) AND CPM33 (WH/VT) FOR A SHORT TO GROUND	

• Key in OFF position.
• Disconnect: Exterior Mirror (LH) C516 or (RH) C622.
• Disconnect: Driver Seat Module (DSM) C341d and C341e.
• Measure the resistance between ground and DSM:
  ▪ (DTC B1781) C341d-1, circuit CPM26 (WH).
  ▪ (DTC B1776) C341e-3, circuit CPM29 (GN).
  ▪ (DTC B1638) C341e-10, circuit CPM28 (BU/BN).
  ▪ (DTC B1634) C341e-13, circuit CPM27 (GY/BU).
  ▪ (DTC B1785) C341d-10, circuit CPM34 (WH/BN).
  ▪ (DTC B1789) C341e-2, circuit CPM31
	Yes
	GO to D11 .
	
	No
	REPAIR the circuit(s) for a short to ground. CLEAR the DTCs. TEST the system for normal operation.

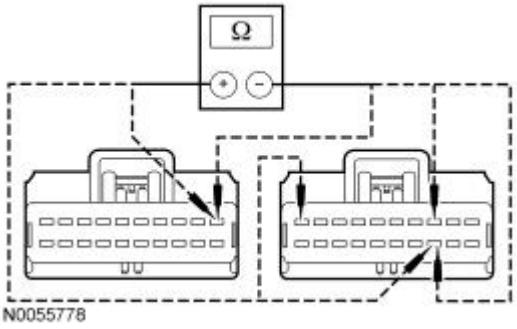
(YE/GY).
- (DTC B1642) C341e-12, circuit CPM32 (WH/BU).
- (DTC B1646) C341e-11, circuit CPM33 (WH/VT).



- **Are the resistances greater than 10,000 ohms?**

D11 CHECK CIRCUITS CPM26 (WH), CPM29 (GN), CPM28 (BU/BN), CPM27 (GY/BU), CPM34 (WH/BN), CPM31 (YE/GY), CPM32 (WH/BU) AND CPM33 (WH/VT) FOR A SHORT TOGETHER

- **NOTE:** DTC B1780, B1781, B1775, B1776, B1637, B1638, B1633 or B1634 only.
- Measure the resistance between DSM:
  - C341e-3, circuit CPM29 (GN) and C341d-1, circuit CPM26 (WH).
  - C341e-3, circuit CPM29 (GN) and C341e-13, circuit CPM27 (GY/BU).
  - C341e-3, circuit CPM29 (GN) and C341e-10, circuit CPM28 (BU/BN).
  - C341d-1, circuit CPM26 (WH) and C341e-13, circuit CPM27 (GY/BU).
  - C341d-1, circuit CPM26 (WH) and C341e-10, circuit CPM28 (BU/BN).
  - C341e-13, circuit CPM27 (GY/BU) and C341e-10, circuit CPM28 (BU/BN).



- **NOTE:** DTC B1784, B1785, B1788, B1789, B1641, B1642, B1645 or B1646 only.
- Measure the resistance between DSM:
  - C341d-10, circuit CPM34 (WH/BN) and C341e-2, circuit CPM31 (YE/GY).
  - C341d-10, circuit CPM34 (WH/BN) and C341e-12, circuit CPM32 (WH/BU).
  - C341d-10, circuit CPM34 (WH/BN) and C341e-11, circuit CPM33 (WH/VT).
  - C341e-2, circuit CPM31 (YE/GY) and C341e-12, circuit CPM32 (WH/BU).

Yes
CHECK the exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open or shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, INSTALL a new mirror. REFER to Exterior Mirror in this section. Otherwise, INSTALL a new exterior mirror motor. REFER to Exterior Mirror Motor in this section. CLEAR the DTCs. TEST the system for normal operation.

No
REPAIR the circuit(s) for an open. CLEAR the DTCs. REPEAT the self-test.

■ C341e-2, circuit CPM31 (YE/GY) and C341e-11, circuit CPM33 (WH/VT). ■ C341e-12, circuit CPM32 (WH/BU), circuit CPM26 (WH) and C341e-11, circuit CPM33 (WH/VT).  N0055779 • **Are the resistances greater than 10,000 ohms?**	
D12 CHECK CIRCUITS VPM35 (YE/BU), LPP06 (YE/BU), VPM36 (BN/YE), RPP06 (GN), VPM37 (BU/OG) AND VPM38 (BN/GN) FOR AN OPEN	
• Key in OFF position. • Disconnect: Exterior Mirror (LH) C516 or (RH) C622. • Disconnect: Driver Seat Module (DSM) C341d. • **NOTE:** DTC B2324 and B2320 only. • Measure the resistance between DSM: ■ (DTC B2324) C341d-9, circuit VPM35 (YE/BU) and LH exterior mirror C516-14, circuit VPM35 (YE/BU). ■ (DTC B2320) C341d-8, circuit VPM36 (BN/YE) and LH exterior mirror C516-13, circuit VPM36 (BN/YE). ■ (DTC B2324 and B2320) C341d-20, circuit LPP06 (YE/BU) and LH exterior mirror C516-12, circuit LPP06 (YE/BU). ■ (DTC B2324 and B2320) C341d-10, circuit RPP06 (GN) and LH exterior mirror C516-15, circuit RPP06 (GN). CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the circuits for a short together. CLEAR the DTCs. REPEAT the self-test.

only. • Measure the resistance between DSM: ▪ C341e-16, circuit VPM38 (BN/GN) and C341c-9, circuit VPM37 (BU/OG). ▪ C341e-16, circuit VPM38 (BN/GN) and C341c-20, circuit LPP06 (YE/BU). ▪ C341e-16, circuit VPM38 (BN/GN) and C341e-14, circuit RPP06 (GN). ▪ C341c-9, circuit VPM37 (BU/OG) and C341c-20, circuit LPP06 (YE/BU). ▪ C341c-9, circuit VPM37 (BU/OG) and C341e-14, circuit RPP06 (GN). ▪ C341c-20, circuit LPP06 (YE/BU) and C341e-14, circuit RPP06 (GN).  • **Are the resistances greater than 10,000 ohms?**	

Pinpoint Test E: The Power Folding Mirrors Do Not Operate

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

Normal Operation

When the exterior mirror select switch is set to the center power folding mirror position and pressed rearward, the switch will ground the driver seat module (DSM) through circuit CPM22 (GY/BN). When the exterior mirrors are extended, and the driver seat module (DSM) receives ground on circuit CPM22 (GY/BN), the DSM will ground circuit (LH) CPM39 (GN/VT)/(RH) CPM40 (WH/OG) and send 12 volts to power folding mirror motors through circuit (LH) CPM04 (VT/BN)/(RH) CPM07 (BN), the mirrors will retract. When the exterior mirrors are retracted, and the DSM receives ground on circuit CPM22 (GY/BN), the DSM will ground circuit (LH) CPM39 (GN/VT)/(RH) CPM40 (WH/OG) and send 12 volts to both power folding mirrors through circuit (LH) CPM04 (VT/BN)/(RH) CPM07 (BN), the mirrors will extend.

Possible Causes

- An open in circuits CPM04 (VT/BN), CPM07 (BN), CPM22 (GY/BN), CPM39 (GN/VT) or CPM40 (WH/OG)
- A short to ground in circuits CPM04 (VT/BN), CPM07 (BN), CPM22 (GY/BN), CPM39 (GN/VT) or CPM40 (WH/OG)
- A short to voltage in circuits CPM04 (VT/BN), CPM07 (BN), CPM39 (GN/VT) or CPM40 (WH/OG)
- A short together in circuits CPM04 (VT/BN), CPM07 (BN), CPM39 (GN/VT) or CPM40 (WH/OG)
- Exterior mirror control switch
- Exterior mirror
- Driver seat module (DSM)

If the power folding mirrors are folded or unfolded continuously (6 to 10 cycles), the power lockout feature will disable the system for 2 minutes to prevent damage to the power fold motors. After 2

minutes have elapsed, normal operation will resume.

PINPOINT TEST E: THE POWER FOLDING MIRRORS DO NOT OPERATE

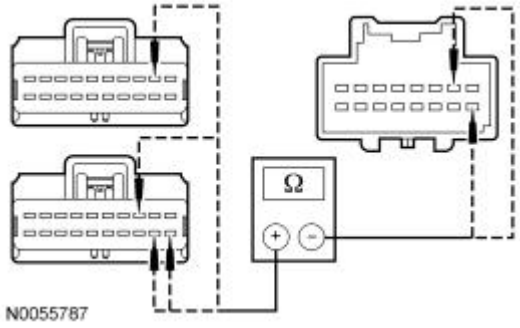
NOTE: Before running a self-test or retrieving codes, the power fold switch must be inactive for at least 30 seconds. Retrieving codes before 30 seconds will result in false codes.

Test Step	Result / Action to Take
E1 RETRIEVE THE DTCs FROM DRIVER SEAT MODULE (DSM)	
• Use the recorded DSM DTCs from the continuous and on-demand self tests. • **Are any DTCs retrieved?**	**Yes** If DTC B109A, B109D, B10A0 or B10A3, GO to E2 . If DTC B109B, B109E, B10A1 or B10A4, GO to E3 . If DTC B109C, B109F, B10A2 or B10A5, GO to E5 . If DTC B1102, CARRY OUT the exterior mirror control switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. If the switch tests OK, GO to E7 . **No** CARRY OUT the exterior mirror control switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. If the switch tests OK, GO to E9 .
E2 CHECK THE POWER FOLD EXTERIOR MIRROR CIRCUITS FOR A SHORT TO VOLTAGE	

• Key in OFF position.
• Disconnect: Inoperative Power Folding Exterior Mirror (LH) C516 or (RH) C622.
• Disconnect: Driver Seat Module (DSM) C341c And C341d.
• Key in ON position.
• Measure the voltage between ground and inoperative power folding exterior mirror:
  ▪ (LH only), C516-16, circuit CPM39 (GN/VT).
  ▪ (LH only), C516-7, circuit CPM04 (VT/BN).
  ▪ (RH only), C622-16, circuit CPM40 (WH/OG).
  ▪ (RH only), C622-7, circuit CPM07 (BN).
	Yes
	REPAIR the circuit(s) for a short to voltage. CLEAR the DTCs. SYNCHRONIZE the power folding mirrors. REFER to Exterior Mirror Motor Synchronization — Power Folding in this section. REPEAT the self-test.
	
	No
	GO to E4 .

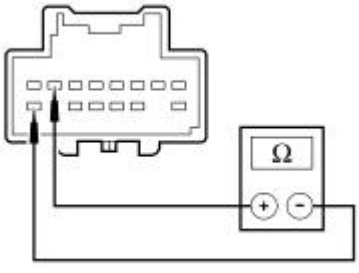
 N0035571 • **Is voltage present?**	
E3 CHECK THE POWER FOLD EXTERIOR MIRROR CIRCUITS FOR A SHORT TO GROUND • Key in OFF position. • Disconnect: Inoperative Power Folding Exterior Mirror (LH) C516 or (RH) C622. • Disconnect: Driver Seat Module (DSM) C341c And C341d. • Measure the resistance between ground and inoperative power folding exterior mirror: ▪ (LH only), C516-16, circuit CPM39 (GN/VT). ▪ (LH only), C516-7, circuit CPM04 (VT/BN). ▪ (RH only), C622-16, circuit CPM40 (WH/OG). ▪ (RH only), C622-7, circuit CPM07 (BN).  N0035572 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to E4 . **No** REPAIR the circuit(s) for a short to ground. CLEAR the DTCs. SYNCHRONIZE the power folding mirrors. REFER to Exterior Mirror Motor Synchronization — Power Folding in this section. REPEAT the self-test.
E4 CHECK THE POWER FOLD EXTERIOR MIRROR CIRCUITS FOR A SHORT TOGETHER • Measure the resistance between inoperative power folding exterior mirror: ▪ (LH only), C516-16, circuit CPM39 (GN/VT) and C516-7, circuit CPM04 (VT/BN). ▪ (RH only), C622-16, circuit CPM40 (WH/OG) and C622-7, circuit CPM07 (BN).  N0055786 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to E10 . **No** REPAIR the circuits for a short together. CLEAR the DTCs. SYNCHRONIZE the power folding mirrors. REFER to Exterior Mirror Motor Synchronization — Power Folding in this section. REPEAT the self-test.

E5 CHECK THE POWER FOLD EXTERIOR MIRROR CIRCUITS FOR AN OPEN	

• Key in OFF position.
• Disconnect: Inoperative Power Folding Exterior Mirror (LH) C516 or (RH) C622.
• Disconnect: Driver Seat Module (DSM) C341c And C341d.
• Measure the resistance between inoperative power folding exterior mirror:
  ▪ (LH only), C516-16, circuit CPM39 (GN/VT) and DSM C341d-11, circuit CPM39 (GN/VT).
  ▪ (LH only), C516-7, circuit CPM04 (VT/BN) and DSM C341d-3, circuit CPM04 (VT/BN).
  ▪ (RH only), C622-16, circuit CPM40 (WH/OG) and DSM C341d-12, circuit CPM40 (WH/OG).
  ▪ (RH only), C622-7, circuit CPM07 (BN) and DSM C341c-2, circuit CPM07 (BN).
  	


N0055787
• **Are the resistances less than 5 ohms?**
	Yes
	GO to E6 .
	
	No
	REPAIR the circuit(s) for an open. CLEAR the DTCs. SYNCHRONIZE the power folding mirrors. REFER to Exterior Mirror Motor Synchronization — Power Folding in this section. REPEAT the self-test.

E6 CHECK THE POWER FOLD EXTERIOR MIRROR FOR A INTERNAL OPEN	

• **NOTE:** Make sure that the power fold mirrors are in the fully extended position. If the inoperative power fold mirror is not fully extended, extend the mirror manually (by hand).
• Measure the resistance between inoperative power fold exterior mirror:
  ▪ (LH only) C516-7, component side and C516-16, component side
  ▪ (RH only) C622-7, component side and C622-16, component side
  	


N0035574
• **Is the resistance less than 100 ohms?**
	Yes
	GO to E10 .
	
	No
	INSTALL a new power folding mirror. REFER to Exterior Mirror in this section. CLEAR the DTCs. TEST the system for normal operation.

E7 CHECK CIRCUIT CPM22 (GY/BN) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Power Mirror Switch C527.	**Yes** GO to E8 .

• Disconnect: Driver Seat Module (DSM) C341c. • Measure the resistance between ground and DSM C341c-18, circuit CPM22 (GY/BN).  N0055788 • **Is the resistance greater than 10,000 ohms?**	**No** REPAIR circuit CPM22 (GY/BN) for a short to ground. CLEAR the DTCs. SYNCHRONIZE the power folding mirrors. REFER to Exterior Mirror Motor Synchronization — Power Folding in this section. REPEAT the self-test.
E8 CHECK CIRCUIT CPM22 (GY/BN) FOR AN OPEN	
• Measure the resistance between DSM C341c-18, circuit CPM22 (GY/BN) and exterior mirror control switch C527-4, circuit CPM22 (GY/BN).  N0055789 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new exterior mirror control switch. REFER to Exterior Mirror Control Switch in this section. SYNCHRONIZE the power folding mirrors. REFER to Exterior Mirror Motor Synchronization — Power Folding in this section. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit CPM22 (GY/BN) for an open. SYNCHRONIZE the power folding mirrors. REFER to Exterior Mirror Motor Synchronization — Power Folding in this section. REPEAT the self-test. TEST the system for normal operation.
E9 CHECK THE POWER FOLD EXTERIOR MIRROR FOR VOLTAGE	
• Key in OFF position. • Disconnect: Inoperative Power Folding Exterior Mirror (LH) C516 or (RH) C622. • While activating the exterior mirror control switch to the out position, measure the voltage between ground and inoperative power folding exterior mirror: ▪ (LH only), C516-16, circuit CPM39 (GN/VT). ▪ (RH only), C622-16, circuit CPM40 (WH/OG).  N0055790 • While activating the exterior mirror control switch to the in position, measure the voltage between ground	**Yes** INSTALL a new power folding mirror. REFER to Exterior Mirror in this section. TEST the system for normal operation. **No** GO to E10.

and inoperative power folding exterior mirror: ■ (LH only), C516-7, circuit CPM04 (VT/BN). ■ (RH only), C622-7, circuit CPM07 (BN).  N0055791 • **Are the voltages greater than 10 volts?**	
E10 CHECK THE DSM FOR CORRECT OPERATION	
• Disconnect all DSM connectors. • Check for: ■ corrosion. ■ pushed-out pins. • Connect all DSM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DSM. REFER to Section 419-10 . CLEAR the DTCs. SYNCHRONIZE the power folding mirrors. REFER to Exterior Mirror Motor Synchronization — Power Folding in this section. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.

Pinpoint Test F: The Heated Mirror Does Not Defrost

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

Refer to Wiring Diagrams Cell 56 , Heated Window for schematic and connector information.

Normal Operation

Under normal operation, when the rear window defrost is ON, the heated exterior mirrors receive power from the rear window defrost relay through circuit CBB23 (BN/YE) and ground through circuit (LH) GD143 (BK/VT) or (RH) GD138 (BK/WH).

Possible Causes

- Open in circuits D138 (BK/WH), GD143 (BK/VT) or CBB23 (BN/YE)
- Exterior mirror glass

PINPOINT TEST F: THE HEATED MIRROR DOES NOT DEFROST

Test Step	Result / Action to Take
F1 CHECK THE HEATED REAR WINDOW OPERATION	

• Key in ON position. • Depress the heated rear window switch to ON. • **Does the heated rear window defrost or warm up?**	**Yes** GO to F2 . **No** REFER to Section 501-11 to diagnose the heated rear window system.
F2 CHECK THE EXTERIOR MIRROR FOR POWER	
• Key in OFF position. • Disconnect: Inoperative Exterior Mirror (LH) C516 or (RH) C622. • Key in ON position. • Depress the heated rear window switch to ON. • Measure the voltage between ground and inoperative exterior mirror (LH) C516-8 /(RH) C622-8, circuit CBB23 (BN/YE).  N0055792 • **Is the voltage greater than 10 volts?**	**Yes** GO to F3 . **No** REPAIR circuit CBB23 (BN/YE) for an open. TEST the system for normal operation.
F3 CHECK THE EXTERIOR REAR VIEW MIRROR GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between ground and inoperative exterior mirror: ▪ (LH) C516-9, circuit GD143 (BK/VT). ▪ (RH) C622-9, circuit GD138 (BK/WH).  N0035643 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new exterior mirror glass. REFER to Exterior Mirror Glass in this section. TEST the system for normal operation. **No** REPAIR circuit GD138 (BK/WH) or GD143 (BK/VT) for an open. TEST the system for normal operation.

Pinpoint Test G: The Auto-Dimming Mirror Does Not Operate Correctly

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

Normal Operation

Under normal operation, the auto-dimming-mirror receives power from circuit CBP31 (BU/OG) and ground from circuit GDD133 (BK). If the vehicle is placed in REVERSE, voltage is sent to circuit CLS10 (GN/BN) and the auto-dimming mirror will turn the dimming feature off. There are 2 photoelectric

sensors: one in the front of the interior rear view mirror and one mounted on the glass side of the mirror. If the sensors are blocked, the auto-dimming feature might not work correctly. Always verify both sensors are not physically blocked before attempting to diagnose auto-dimming mirror concerns.

Possible Causes

- Open in circuit CBP31 (BU/OG), GDD133 (BK) or CLS10 (GN/BN).
- Auto-dimming mirror

PINPOINT TEST G: THE AUTO-DIMMING MIRROR DOES NOT OPERATE CORRECTLY

NOTE: If the transmission range (TR) sensor is malfunctioning and the backup lamps are on all the time or do not turn on, the auto-dimming interior mirror will not darken or return to normal view.

Test Step	Result / Action to Take
G1 CHECK OPERATION OF THE BACKUP LAMPS	
• Key in ON position. • Move the shift control selector through the entire range. • **Do the backup lamps illuminate only in REVERSE?**	**Yes** GO to G2. **No** REFER to Section 417-01.
G2 VERIFY THE FORWARD AND REARWARD FACING SENSORS ARE NOT BLOCKED	

• Visually verify the forward and rearward facing sensors are not blocked. Sources of blockage can include:
  ▪ Stickers, window decals or tags.
  ▪ Fold-down screens for TVs or DVD players.
  ▪ Non-OEM window tinting.
• **Were either of the sensors blocked?**
	Yes
	If possible, remove the blockage. TEST the system for normal operation. If it is not possible to remove the blockage, REVIEW the operation of the auto-dimming mirror with the customer.
	
	No
	GO to G3.

G3 CHECK OPERATION OF THE AUTO-DIMMING INTERIOR MIRROR — DAYLIGHT CONDITIONS	
• Key in ON position. • Use a bright lamp to illuminate the forward facing sensor and the rear facing sensor. The mirror should adjust to a high reflectance mode (mirror will be clear).  N0057545 • **Does the mirror adjust to the high reflectance (clear) mode?**	**Yes** GO to G4. **No** GO to G7.
G4 CHECK THE OPERATION OF THE AUTO-DIMMING MIRROR — NIGHTTIME CONDITIONS WITHOUT GLARE	
• Key in ON position.	**Yes**

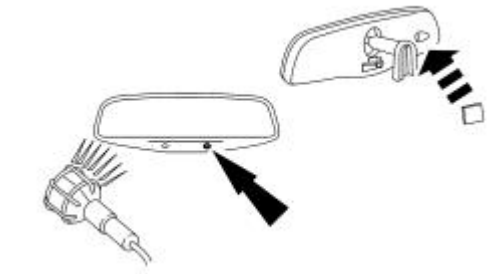
• **NOTE:** Covering the sensor with a finger or hand is not adequate.
• Simulate nighttime conditions without glare:
  ■ Cover the forward sensor with black electrical tape or other dark material.
  ■ Cover the rear facing sensor. The mirror should adjust to the high reflectance mode.
 	
N0057547
• **Did the mirror adjust to the high reflectance (clear) mode?**
	GO to G5 .
	
	No
	GO to G7 .

G5 CHECK THE OPERATION OF THE AUTO-DIMMING MIRROR — NIGHTTIME CONDITIONS WITH GLARE	

• Key in ON position.
• **NOTE:** Covering the sensor with a finger or hand is not adequate.
• Simulate nighttime conditions with glare:
  ■ Cover the forward sensor with black electrical tape or other dark material.
  ■ Illuminate the rear facing sensor. The mirror should darken to a lower reflectance mode.
 N0057546
• **Did the mirror darken to a lower reflectance (darker) mode?**
	Yes
	GO to G6 .
	
	No
	GO to G7 .

G6 CHECK THE OPERATION OF THE AUTO-DIMMING MIRROR — NIGHTTIME CONDITIONS WITH VEHICLE IN REVERSE	

• Key in ON position.
• **NOTE:** Covering the sensor with a finger or hand is not adequate.
• Simulate nighttime conditions with glare:
  ■ Cover the forward sensor with black electrical tape or other dark material.
  ■ Illuminate the rear facing sensor.
	Yes
	The system is operating normally at this time. REVIEW operation of the auto-dimming interior mirror feature with the customer.
	
	No
	GO to G7 .

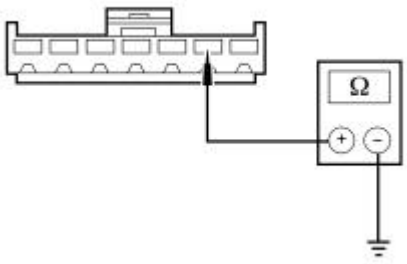


N0057546

- Select REVERSE.
- **Did the mirror adjust to a high reflectance (clear) mode?**

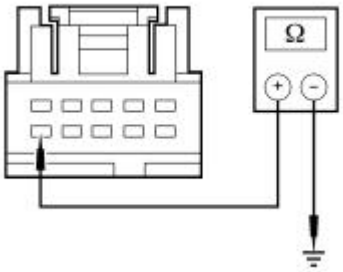
G7 CHECK CIRCUIT CBP31 (BU/OG) FOR VOLTAGE	
• Disconnect: Interior Mirror C911 (without navigation system)/C9012 (with navigation system). • **NOTE:** Not equipped with vehicle navigation system. • Measure the voltage between ground and auto-dimming interior mirror C911-1, circuit CBP31 (BU/OG).  A0073174 • **NOTE:** Equipped with vehicle navigation system. • Measure the voltage between ground and auto-dimming interior mirror C9012-1, circuit CBP31 (BU/OG).  N0055793 • **Is the voltage greater than 10 volts?**	**Yes** GO to G8 . **No** VERIFY smart junction box (SJB) fuse 31 (10A) is OK. If OK, REPAIR circuit CBP31 (BU/OG) for an open. TEST the system for normal operation.

G8 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Key in OFF position. • **NOTE:** Not equipped with vehicle navigation system. • Measure the resistance between ground and auto-dimming interior mirror C911-2, circuit GD133 (BK).	**Yes** GO to G9 . **No** REPAIR circuit GD133 (BK) for an open. TEST the system for normal operation.



A0073175

- **NOTE:** Equipped with vehicle navigation system.
- Measure the resistance between ground and auto-dimming interior mirror C9012-10, circuit GD133 (BK).

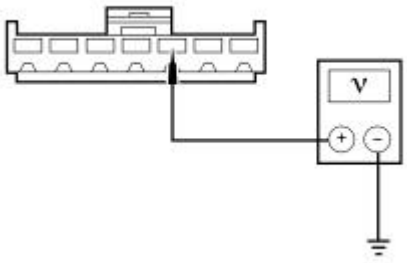


N0055794

- **Is the resistance less than 5 ohms?**

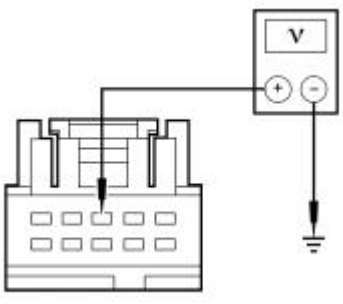
G9 CHECK CIRCUIT CLS10 (GN/BN) FOR VOLTAGE

- Key in ON position.
- Select REVERSE.
- **NOTE:** Not equipped with vehicle navigation system.
- Measure the voltage between ground and auto-dimming interior mirror C911-3, circuit CLS10 (GN/BN).



A0073178

- **NOTE:** Equipped with vehicle navigation system.
- Measure the voltage between ground and auto-dimming interior mirror C9012-3, circuit CLS10 (GN/BN).



N0055795

- **Is the voltage greater than 10 volts?**

Yes
INSTALL a new interior mirror. REFER to Interior Rear View Mirror in this section. TEST the system for normal operation.

No
REPAIR circuit CLS10 (GN/BN) for an open. TEST the system for normal operation.

Exterior Mirror Motor Synchronization — Power Folding

Printable View (78 KB)

NOTE: This procedure must be performed any time the power folding mirrors are manually folded in or out, or if the position of the mirror case has been moved without using the mirror control switch.

1. Set the mirror control switch to the CENTER position.

NOTE: It may be necessary to cycle the power folding mirrors in or out up to 4 times before they are synchronized.

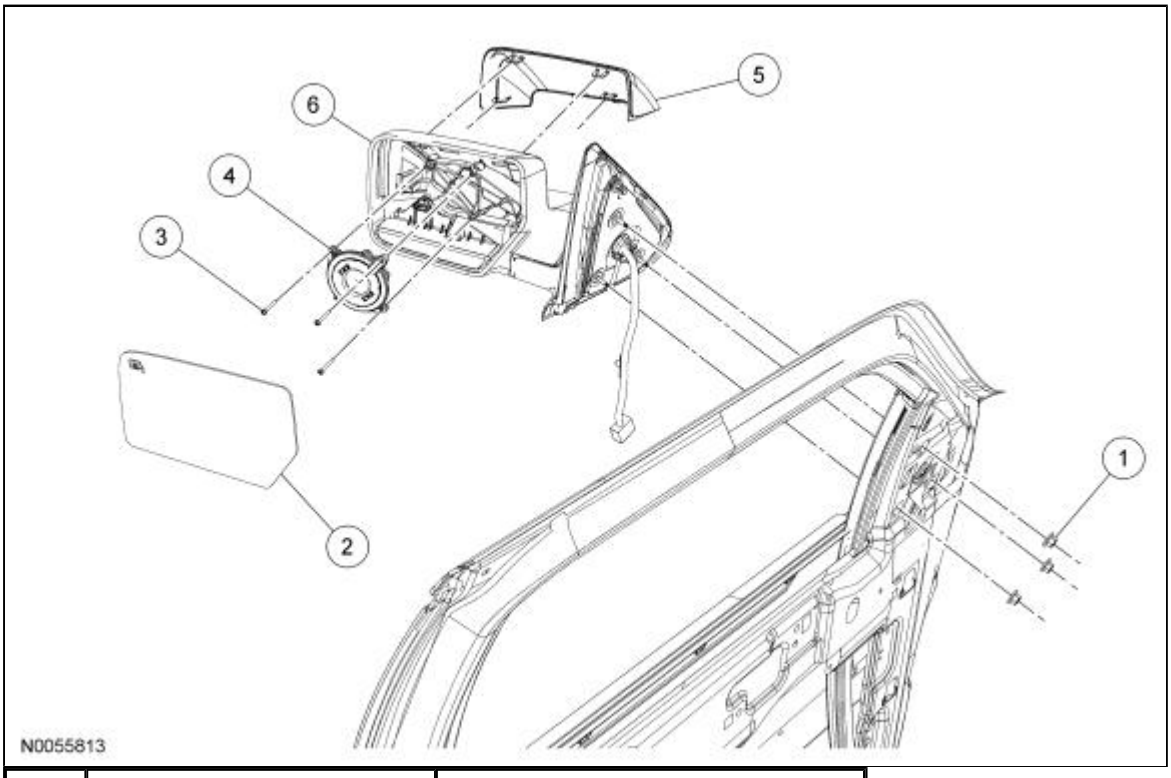
2. Use the mirror control switch (press rearward) to automatically cycle the power folding mirrors in and out 4 times.

3. When an audible popping sound is heard, the power folding mirror motors are synchronized.

Exterior Mirrors — Exploded View

Printable View (180 KB)

NOTE: LH side shown, RH side similar.



Item	Part Number	Description
1	N621906	Exterior mirror nut (3 required)
2	17K707	Exterior mirror glass
3	—	Exterior mirror motor screw
4	17D696	Exterior mirror motor
5	17D742 RH/ 17D743 LH	Exterior mirror cover
6	17682 RH/ 17683 LH	Exterior mirror

1. For additional information, refer to the procedures in this section.

Exterior Mirror

Printable View (79 KB)

Removal and Installation

NOTE: If equipped with power folding mirrors, they must be synchronized any time the mirrors have been folded or unfolded without using the mirror control switch. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

NOTE: Do not remove the exterior mirror asembly when repairing an individual part. Individual components can be installed without removing the exterior mirror.

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Position aside the weather shield.
3. Disconnect the exterior mirror electrical connector.
4. Remove the exterior mirror.
   - Remove the nuts.
   - To install, tighten to 7 Nm (62 lb-in).
5. To install, reverse the removal procedure.
   - Install top nut first.
   - If equipped with power folding mirrors, they must be synchronized. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

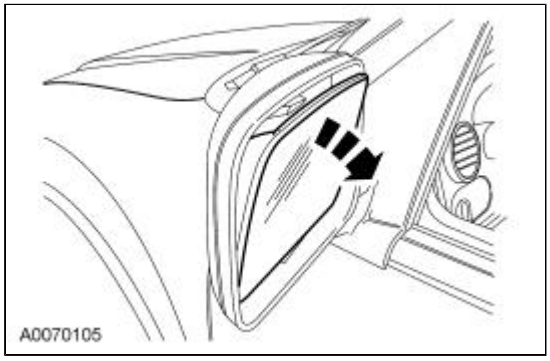
Exterior Mirror Glass

Printable View (165 KB)

Removal and Installation

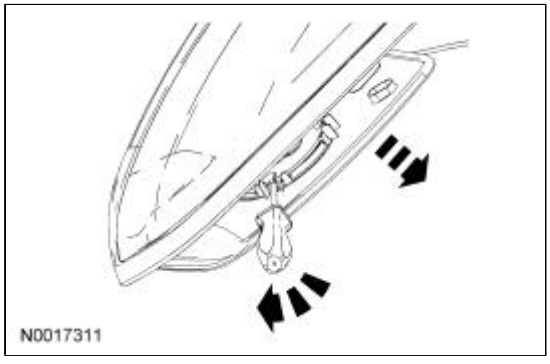
NOTE: If equipped with power folding mirrors, they must be synchronized any time the mirrors have been folded or unfolded without using the mirror control switch. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

1. Position the exterior mirror glass in a downward position to obtain a gap at the edge of the mirror.

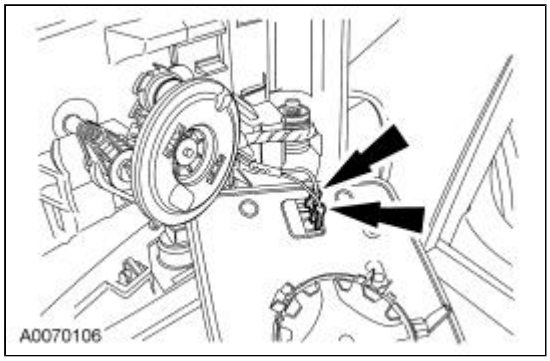


2. **WARNING: Place a shop towel between the exterior mirror glass and the hand to avoid personal injury in the instance of glass breakage.**

   Disengage the mirror glass.
   - Insert a flat-blade screwdriver between the mirror glass tabs and the mounting plate, and rotate to separate the locking tabs from the mounting plate.
   - Carefully pull the top edge of the glass away from the exterior mirror housing.



3. If equipped, disconnect the heated mirror electrical connectors and remove the glass.



4. To install, reverse the removal procedure.
    - Rotate the exterior mirror glass in all directions after the installation to make sure all clips are completely attached.
    - If equipped with power folding mirrors, they must be synchronized. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

Exterior Mirror Motor

Printable View (79 KB)

Removal and Installation

NOTE: If equipped with power folding mirrors, they must be synchronized any time the mirrors have been folded or unfolded without using the mirror control switch. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

1. Remove the mirror glass. For additional information, refer to Exterior Mirror Glass in this section.

2. Remove the 3 exterior mirror motor screws and exterior mirror motor.
   - Disconnect the electrical connectors.

3. To install, reverse the removal procedure.
   - If equipped with power folding mirrors, they must be synchronized. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

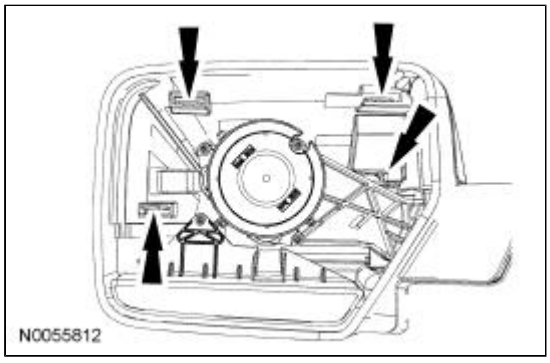
Exterior Mirror Cover

Printable View (112 KB)

Removal and Installation

NOTE: If equipped with power folding mirrors, they must be synchronized any time the mirrors have been folded or unfolded without using the mirror control switch. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

1. Remove the mirror glass. For additional information, refer to Exterior Mirror Glass in this section.
2. Release the 4 retaining tabs and remove the exterior mirror cover.

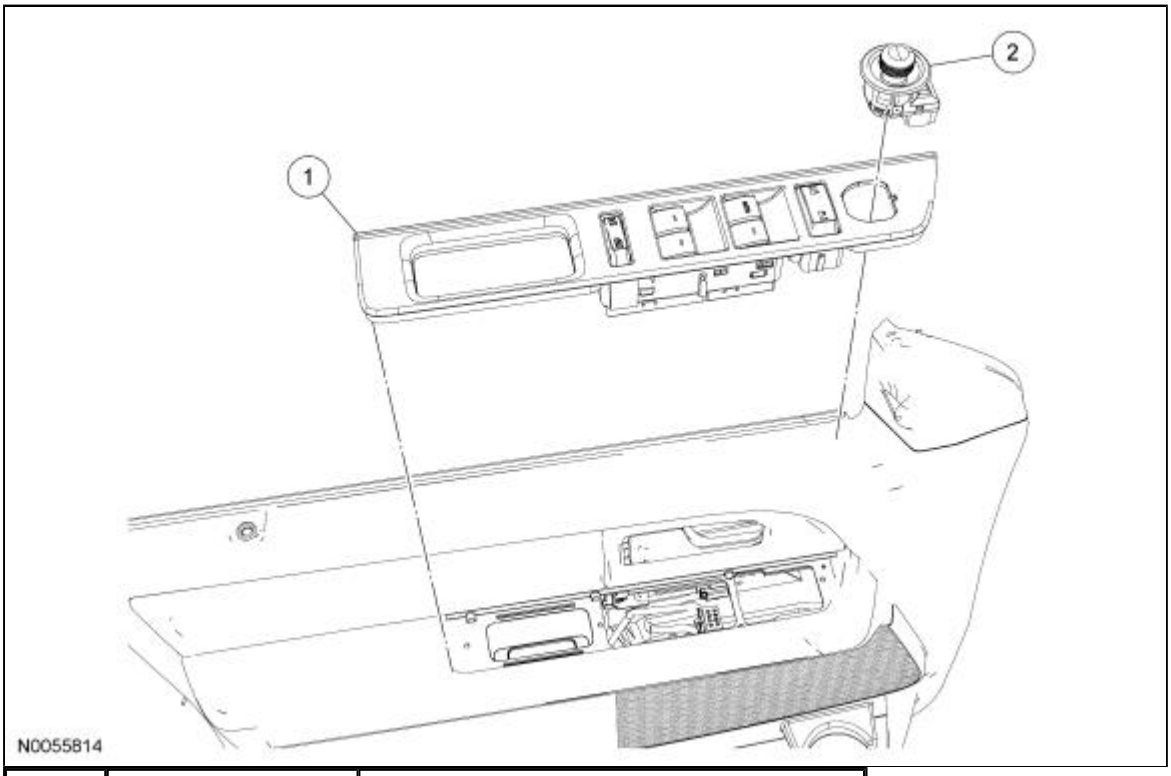


3. To install, reverse the removal procedure.
   - Rotate the exterior mirror glass in all directions after installation to make sure all clips are completely attached.
   - If equipped with power folding mirrors, they must be synchronized. For additional information, refer to Exterior Mirror Motor Synchronization — Power Folding in this section.

Exterior Mirror Control Switch

Printable View (167 KB)

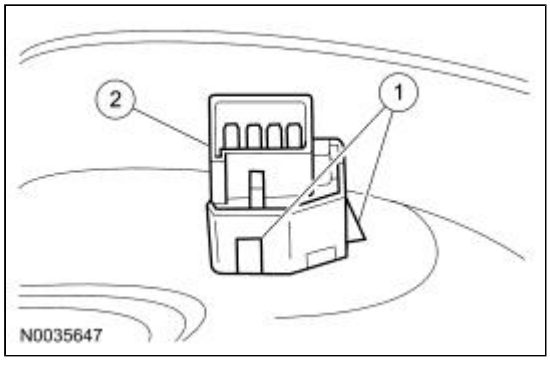
NOTE: Expedition shown, Navigator similar.



Item	Part Number	Description
1	14525	Switch bezel
2	17B676	Exterior mirror control switch

Removal and Installation

1. Remove the driver front door trim panel. For additional information, refer to Section 501-05 .
2. Remove the exterior mirror control switch.
   1. Depress the locking tabs.
   2. Remove the exterior mirror control switch.



3. To install, reverse the removal procedure.

Interior Rear View Mirror

Printable View (117 KB)

Special Tool(s)

ST2833-A	Mirror Remover 501-D118
ST1793-A	Installer, Rear View Mirror 501-025 (T94P-17700-AH)

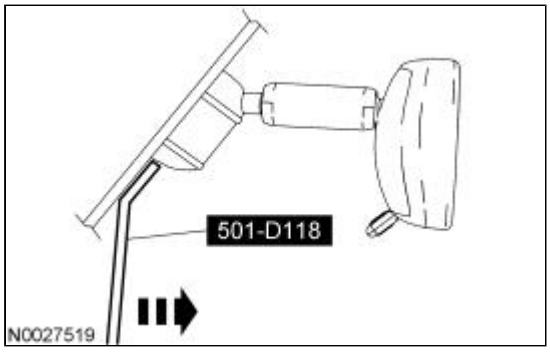
Removal

1. **CAUTION: Twisting the interior rear view mirror base from right to left may cause a stress fracture of the windshield.**

   Remove the wire cover (if equipped).

2. Remove the compass by pulling down on the compass rearmost edge (if equipped).

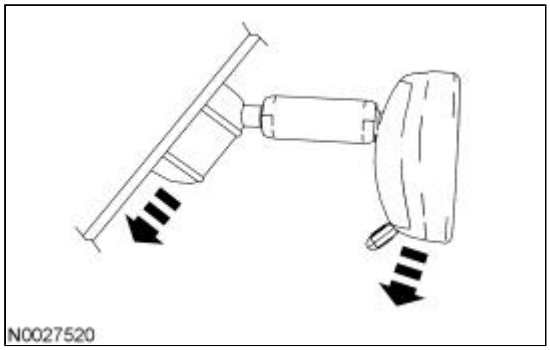
3. Insert the special tool between the mirror mount and windshield bracket from the bottom.



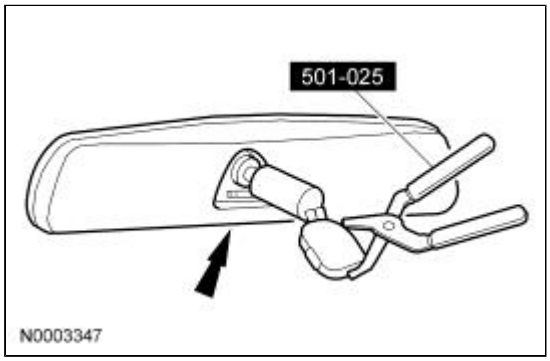
4. Release the mirror mount from windshield bracket by pulling the tool away from the windshield.

Installation

1. Slide the mirror mount over the windshield bracket from the top and adjust the mirror to the up position.



2. Using the special tool, press the mirror assembly downward along the windshield until the mount is seated on windshield bracket.



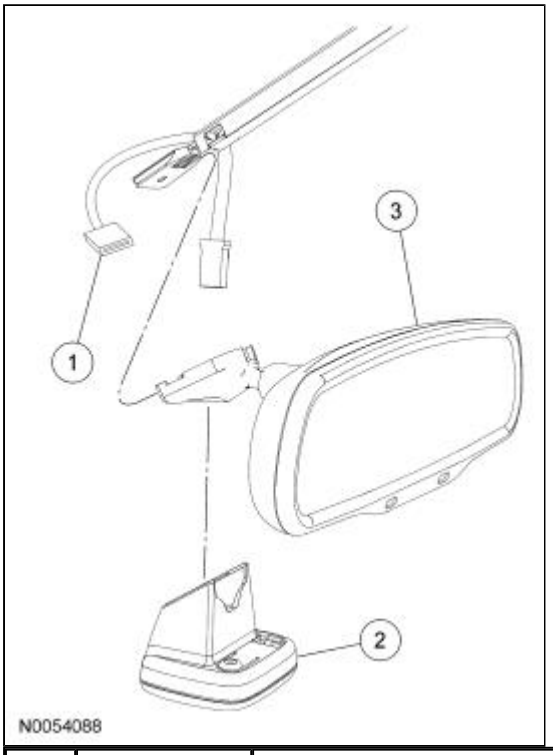
3. Install compass and wire cover (if equipped).

Auto-Dimming Interior Mirror

Printable View (132 KB)

Special Tool(s)

ST2833-A	Mirror Remover 501-D118



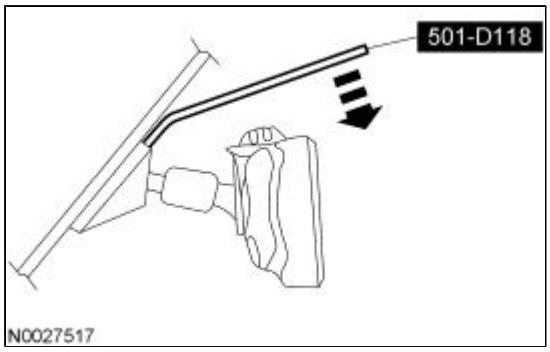
Item	Part Number	Description
1	—	Interior mirror electrical connector (part of 14A005)
2	19A548	Electroic compass sensor
3	17700	Interior mirror

Removal

1. Remove the wire cover.
2. Disconnect the electrical connector.
3. **NOTE:** The compass (if equipped) does not need to be removed prior to this step.

   NOTE: High level mirror shown, others similar.

Insert the special tool between the mirror mount and windshield bracket from the top.

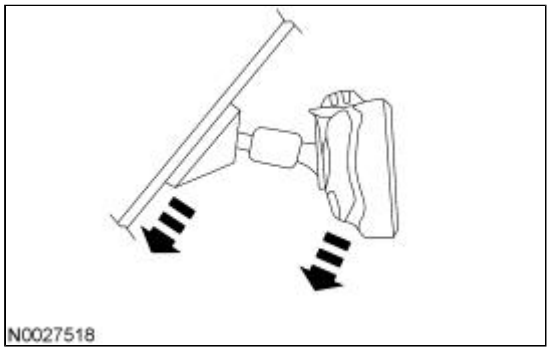


4. If equipped, separate the compass from the mirror assembly by disengaging the compass locking tabs.

5. Release the mirror mount from the windshield bracket by pulling the tool and mirror down and away from the windshield.

Installation

1. Slide the mirror mount over the windshield bracket from the top and adjust the mirror to the up position.



2. Quickly press the mirror assembly downward along the windshield until a click is felt. The click indicates the base is engaged to the windshield bracket.

3. If equipped, install the compass, electrical connector and wire cover. Check the compass zone and calibration. For additional information, refer to Section 413-08 .

Seats

Printable View (73 KB)

Front Seats

Forty Percent Seats

The front 40 percent seats can be equipped with the following systems:

- Two-way manual seat track
- Six-way power seat tracks
- Memory driver seat
- Manual lumbar
- Power lumbar
- Manual recline
- Power recline
- Adjustable head restraints
- Seat side air bags
- Driver and passenger seat safety belt buckle and pretensioners
- Heated/cooled climate controlled seats
    - With climate controlled seating, there is an air filter located in the fan motor housing under the seat. See the owner literature for additional service and scheduled maintenance interval information.

Sixty Percent Seats

The 60 percent passenger seat can be equipped with:

- Front passenger seat center armrest
- Manual recliner
- Two-way manual seat track
- Seat side air bag
- Adjustable head restraint

Driver Seat Module — Memory Seat

The power driver seat, power outside rear view mirrors, power adjustable pedals and adjustable steering column are controlled by the driver seat module (DSM) only when the vehicle is equipped with the programmable/recall memory option. The DSM is located on the driver seat track.

This system allows automatic positioning of the driver seat to 2 programmable positions.

The memory seat system consists of the following components:

- DSM
- Driver memory seat control switch
- Memory set switch
- Adjustable pedal switch
- Power mirror switch
- Adjustable steering column switch
- Memory seat track assembly (with seat position sensors integral to motors)
    - Horizontal motor (part of seat track)
    - Front height motor (part of seat track)
    - Rear height motor (part of seat track)
- Backrest power recliner motor (with integral position sensor) (part of backrest frame)
- LH memory power mirror
- RH memory power mirror
- Power adjustable memory pedals
- Power adjustable steering column
- Remote keyless entry transmitter

Two personalized seat positions may be programmed into the memory seat system. A memory seat position may be set by first positioning the driver seat using the driver power seat switch and depressing the memory set switch. Memory seat position 1 or 2 must be selected within 5 seconds to set a personalized seat position. If position 1 or 2 is not selected within 5 seconds, the operation is aborted. This operation also aborts if any input is received from the driver power seat switch, the power mirror switch, the adjustable pedal switch, the power adjustable steering column switch or if the memory set switch is depressed again during the 5-second limit. The personalized memory seat positions are recalled using the memory switch positions 1 and 2 or with the remote keyless entry transmitter.

A programmed seat position can only be recalled when the transmission selector is in PARK or NEUTRAL with the ignition switch in the RUN position. A position may be programmed at any time.

For information on the DSM, refer to Section 419-10 .

Easy Entry/Easy Exit

The driver power seat easy entry/easy exit feature can be enabled/disabled. Refer to the Owner's Literature.

Climate Controlled Seats

The climate control seat system is able to heat and cool the front seats. Each climate controlled seat is operated by push-buttons on the electronic automatic temperature control (EATC) module located on the instrument panel. Each front seat temperature is then monitored and controlled by the climate control seat module (CCSM) located on the passenger front seat track.

The front seat cushions are equipped with a plenum (duct) attached to the cushion frame suspension wires (serviced with the cushion frame). Air from the cushion thermo-electric device (TED) and blower assembly is routed through a plenum and into the manifold fitted within the cushion foam pad (serviced with the cushion foam pad). The front seat backrest TED and blower assembly operates similarly by routing air directly through the backrest manifold (serviced with the backrest foam pad).

The climate controlled seat system contains the following components:

- EATC module
- CCSM

- TED and blower assembly within each front seat cushion and backrest
- Air filter (attached to each TED and blower assembly)
- Cushion and backrest foam pads (includes manifolds)
- Cushion and backrest trim covers

Manual Lumbar

The manual front seat backrest lumbar is adjusted by a knob mounted on the side of the seat cushion side shield. The lumbar adjuster is mounted to the seat track assembly and drives a cable connected to the lumbar assembly attached to the backrest frame.

Power Lumbar

The driver seat has an electro-mechanical backrest lumbar assembly. The lumbar switch adjustment is on the side of the seat cushion side shield and is part of the seat control switch. The lumbar motor is mounted to the lumbar assembly and is serviced only with a new lumbar assembly.

Manual Recliner

The manual recliner can be adjusted by a handle mounted on the outboard side of the cushion side shield. Manual recliners are only serviceable by installing a new backrest frame assembly.

Power Recliner

The driver seat has an electro-mechanical backrest adjuster. The backrest adjustment switch is located on the side of the seat cushion side shield and is part of the seat control switch. The recliner motor is mounted to the backrest frame. Power recliners and motors are only serviceable by installing a new backrest frame assembly.

Seat Side Air Bags

The driver and passenger seat side air bags are attached to the seat backrest frame. For information, or if a seat side air bag deployment has occurred, refer to Section 501-20B .

Safety Belt Buckle Pretensioners

The driver and passenger front seats are equipped with safety belt buckle and pretensioner assemblies attached to the seat tracks. For information, or if a deployment has occurred, refer to Section 501-20B .

Seats — Second Row

The second row can have 40/20/40 or 40/center console/40 seats.

Forty Percent E-Z Entry Seats

The 40 percent E-Z entry seats are equipped with:

- fold-flat backrests.
- tip-forward seat base mechanisms for easy entry to third row seating.
- kneeling seat base mechanisms for added level cargo area.
- adjustable folding head restraints.
- manual recliners.

The 40 percent E-Z entry seat is serviced as an assembly. Only the trim coverings and head restraint can be serviced.

Twenty Percent Seat

The second row 20 percent center seat is equipped with:

- fold-flat backrest.
- 2-way manual seat track.
- adjustable head restraint.
- 3-point center safety belt.

Seats — Third Row

The third row seat:

- is 3-passenger seat.
- is a 60/40 split bench seat.
- folds down for more cargo area.
- has optional power fold-down seats.
- has a 3-point center safety belt integral to the 60 percent seat.

Third Row Power-Fold Seat

The third row power-fold seats are activated by the rear power-fold seat switches. The power-fold seats only operate with the vehicle in PARK, and the liftgate glass, liftgate door or any entry door is open, allowing the smart junction box (SJB) to enable power to the third row power-fold seat system.

The third row power-fold seat consists of the following components:

- SJB
- RH and LH third row power-fold seat relays
- RH and LH power-fold seat motors
- RH and LH rear third row seat switches
- RH and LH drive gear assemblies

The third row power-fold seat motors control drive gear assemblies to raise and lower the seat

backrests. The power-fold motors are serviceable separately.

Seats

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Driver and Passenger Power Seats Without Memory

The 10-way seat control feature moves the seat in 10 possible directions: the seat can be moved forward or backward and the front and back of the cushion can be moved up and down independently. The backrest of the seat can be moved forward and backward, and the lumbar can be moved in and out. All 10 positions are controlled by one switch. The power seat feature operates independent of the ignition switch position.

The 6-way power seat feature moves the seat in 6 possible directions: the seat can be moved forward or backward and the front and back of the cushion can be moved up and down independently. The power seat feature operates independent of the ignition switch position.

The power seat motors are hardwired to the seat control switch. The circuits are normally at ground through the seat control switch. An individual circuit is switched to power when a specific adjustment position is selected.

Power Driver Seat With Memory

The memory driver seat feature allows the driver to program a personalized seat position that can be recalled using the memory switch or a remote keyless entry (RKE) transmitter (if associated). There are 2 memory settings possible. The outside rear view mirror positions, the power adjustable pedals (if equipped) position and power adjustable steering column tilt position are also stored and recalled with the power driver seat positions. For vehicles equipped with power telescopic steering columns, only the tilting feature is controlled by the memory system.

The driver power seat is controlled by the driver seat module (DSM), if equipped. The DSM is located underneath the driver seat cushion frame. Programmable module installation (PMI) must be carried out when installing a new DSM. Refer to Section 418-01 . The DSM does not require calibration to the driver

seat track.

The driver seat control switch provides voltage to the DSM when activated. The neutral position of each driver seat control switch position is a ground state through the seat control switch contacts. A voltage input causes the DSM to power the appropriate motor until the input is removed. Ground is the normal state of the motor circuits through the DSM and is not switched to control the motors. The DSM internally switches the appropriate circuit from ground to power for operating the motors.

As the seat is adjusted, the DSM constantly monitors the motor position sensors to record the current seat position. The DSM will remove power from the motor upon termination of the seat control switch input or if the DSM does not see movement from the motor by monitoring the position sensor.

The DSM has the ability for soft stops both at the upper and lower limits on all axis of the driver seat and power adjustable steering column. When an axis reaches the hard stop and the switch is held for approximately one second it will then back up 180 msec and establish the soft stop for that axis in that direction. The DSM uses this 'back up' strategy to check sensor integrity any time movement has stopped prematurely due to a sensor failure or obstruction.

The DSM communicates diagnostic trouble code (DTC) and other information using the MS-CAN communication bus. It should be noted for diagnostics that because CAN bus communication is more robust and reliable than other methods, it may be possible to have limited module communication with one of the CAN bus circuits disconnected or shorted to ground. Refer to Section 418-00 for additional information concerning MS-CAN bus communication.

This section only diagnoses concerns specific to the memory seat. To diagnose a memory power mirror concern, refer to Section 501-09 . To diagnose a power adjustable pedal concern, refer to Section 206-00 . To diagnose a power adjustable steering column concern, refer to Section 205-04 .

Programming Memory Seat Positions

- A power driver seat position can be stored at any time. The driver must move the seat to the desired position using the driver seat control switch. The driver must then depress the memory set switch. Within 5 seconds, the driver must select a memory position. Memory 1 is selected by depressing memory switch 1. Memory 2 is selected by depressing memory switch 2.
- If no memory switch input is received within the 5-second time limit, the operation is aborted. If one of the following inputs is received during the 5-second programming limit, the operation is aborted:
  - Power driver seat control switch
  - Memory set switch
  - Power adjustable pedal switch
  - Power adjustable steering column switch (power tilt switch only, telescopic switch does not apply, if equipped)

Recalling a Stored Memory Seat Position

NOTE: A memory recall can be initiated only if the vehicle is in PARK or NEUTRAL gear and the ignition switch is not in START. A memory recall in progress will not be affected by moving the ignition switch to START or by moving the gearshift lever out of PARK or NEUTRAL.

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

Once the driver has stored the driver seat position, the driver can recall the setting by depressing the corresponding memory switch or by using a programmed remote entry transmitter.

The driver can recall the desired driver seat position by depressing one of the memory recall switches. Depressing memory switch 1 will initiate a recall of the power driver seat position stored in Memory 1. Depressing memory switch 2 will initiate a recall of the power driver seat position stored in Memory 2.

A RKE transmitter can be used to recall previously set memory positions but must first be associated to that memory position. The transmitter associated with personality 1 is capable of recalling memory position 1 only. Similarly, the associated personality 2 transmitter can recall only memory position 2. Up to 8 RKE transmitters can be associated for memory position recall.

Memory recall occurs when the unlock switch is depressed on the RKE transmitter if it has been associated with a memory position. The second depression of the unlock switch, which unlocks passenger doors, does not initiate a memory recall.

A RKE transmitter can be associated with a memory seat position by pressing a RKE button within 5 seconds after pressing the memory set switch button (when setting a memory seat position). Refer to the Owner's Literature for additional information on using RKE transmitters.

A memory recall in progress does not prohibit the initiation of another memory recall; the most recently requested memory recall will be executed.

Easy Entry/Exit Feature

The easy entry/exit feature moves the seat backwards about 2 inches when the ignition key is removed from the ignition switch. The DSM receives a key out command over the MS-CAN communication network and powers the driver seat rearward. This function will not operate if the seat is less than the travel distance to the end of the track or the function has been disabled. The DSM will also cancel this operation if a valid input command is received, such as the seat control switch or memory recall request.

The DSM will record the current seat position before powering the seat for an easy exit operation. This recorded position will be used to return the seat to this position on the easy entry operation. During easy entry operation, the seat is returned to the position previous to the easy exit operation. Easy entry operation will be cancelled if a valid input command is received by the DSM.

The easy entry/exit feature can be disabled and enabled by selecting easy entry on the message center display with the setup control button and pressing the reset control to select on or off from the display menu. Refer to driver controls in the Owner's Literature for additional instructions for using the message center.

Climate Controlled Seat System

NOTE: When installing a new climate control seat module (CCSM), it is necessary to carry out programmable module installation (PMI). Refer to Section 418-01 .

Both the driver and front passenger climate controlled seats are independently controlled electronically by the CCSM mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB 08 (VT) into CCSM C3265a pins E and F.

Both climate controlled seats operate independently. If a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

The 4 switches (identified with seat icons) on the electronic automatic temperature control (EATC) module activate each seat system setting and illuminate LEDs above each switch to indicate the

operating mode, 3 LEDs for HIGH, 2 LEDs for MED or 1 LED for LOW. The push-buttons with the blue seat icon operate the seat cooling mode and the push-buttons with the red seat icon operate the seat heating mode. The climate controlled seat system is not equipped with auto-mode.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

The TED uses a Peltier circuit of P-type and N-type semiconductors connected in series using copper electrical conductors. The semiconductors are sandwiched between 2 copper heat exchangers. When current is applied to the TED, one side releases energy as heat, while the opposite side absorbs energy and gets cold. By reversing the current flow, the hot and cold sides reverse.

NOTE: Avoid applying power directly to a TED for testing its operation. Doing so may cause damage to the TED or shorten its usable life.

The temperature differences between the individual heated and cooled settings is minimal. For example, it is difficult to distinguish between LOW COOL and MEDIUM COOL settings. Measuring seat temperature at different settings is possible by monitoring the CCSM PIDs using the scan tool.

The EATC module communicates climate controlled seat commands to the CCSM using the medium speed controller area network (MS-CAN) communication bus. The MS-CAN bus is connected to the data link connector (DLC) for diagnostic use. No direct connection exists between the CCSM and EATC for the climate controlled seat switches. The climate controlled seats can be commanded using the scan tool to verify both module communication on the MS-CAN bus and operation of the CCSM. This method may be useful for isolating a control switch concern. It should also be noted that because CAN bus communication is more robust and reliable than other methods, it may be possible to have limited module communication with one of the CAN bus circuits disconnected or shorted to ground. Refer to Section 418-00 for additional information concerning CAN bus communication.

Heating Characteristics

NOTE: The presence of overtemperature faults (DTCs B2729, B2730, B272A and B272B) can be induced by incorrect operation of the climate controlled seat system after an initial HEAT setting has been attained. If a HEAT setting is repeatedly turned OFF and ON in an attempt to increase the seat temperature, an overtemperature condition can result and the DTC(s) will be set.

- In HEAT mode, the TED circuits of a given seat are wired in parallel internally in the CCSM.
- The climate controlled seat system draws approximately 24 amperes, with both seats heating, until reaching the set point and then the system operates at a reduced amperage to maintain the climate setting.
- In HEAT mode, the TED can add up to 40°C-60°C (72°F-108°F) to the ambient air temperature entering the system.
- There are 4 manual settings based on the LEDs above each seat heat switch button on the EATC. The first setting is HIGH (3 LEDs), the second setting is MED (2 LEDs), the third is LOW (1 LED) then OFF (no LEDs).
- In the LOW setting, the climate controlled seat module is set to maintain TED temperature at approximately 46°C (115°F).
- In the HIGH setting, the climate controlled seat module is set to maintain TED temperature at 65° C (149°F).
- If the temperature at one of the TEDs rises above 110°C (230°F) in the HEAT mode or 65°C (149°F) in the COOL mode for more than 4 seconds, the CCSM will record an overtemperature DTC, remove power from the TEDs and go into blower only mode in an attempt to cool down the TEDs. If the TEDs temperature has not dropped to 105°C (221°F) in the HEAT mode or 60°C (140°F) in the COOL mode after 30 seconds, the CCSM will shut down and remain off until the

ignition is cycled. Also if the CCSM detects an overtemperature twice during the same ignition cycle, it will also shut down.
- When heating, the CCSM will vary the speed of the fans and the TED duty cycle in order to reach and maintain the temperature determined by the switch setting.

Climate Controlled Seat Heat State	Initial Temperature	Final Temperature
HIGH	90°C (194°F)	65°C (149°F)
MED	80°C (176°F)	60°C (140°F)
LOW	75°C (167°F)	46°C (115°F)

Cooling Characteristics

- In COOL mode, the TED circuits of a given seat are wired in series internally in the CCSM.
- The climate controlled seat system draws approximately 10 amps for the first 12 minutes and will operate at 2 amps thereafter.
- In COOL mode, the TED can remove up to 8°C (14°F) from the ambient air temperature entering the system.
- There are 4 manual settings based on the LEDs above each seat cool switch button on the EATC. The first setting is HIGH (3 LEDs), the second setting is MED (2 LEDs) and the third is LOW (1 LED) then OFF (no LEDs).
- If the temperature at one of the TEDs falls below 5°C (41°F), the climate controlled seat module will shut down the TEDs. If the temperature continues to drop below 2°C (36°F), the climate controlled seat module will shut down the blower motors.
- When cooling, the CCSM maintains constant speed of the fans and constant TED supply voltage (duty cycle) in open loop COOL mode.

Climate Controlled Seat Cool State	TED Voltage	TED Supply Duty Cycle
HIGH	Vbat	100%
MED	Vbat	75%
LOW	Vbat	50%

The climate controlled seat system is deactivated by one of the following actions:

- Selecting the EATC module setting to manual OFF
- Turning the vehicle OFF

Third Row Power-Fold Seat

CAUTION: To prevent possible damage to the third row seat or the safety belts, make sure that the safety belts are not fastened when moving the seat to the load floor position.

CAUTION: Make sure that no objects such as books, purses or briefcases are on the floor in front of the third row seats or on the seat cushion before lowering the backrest(s).

For the third row power-fold seat to operate, a shared voltage is supplied by the smart power distribution junction box (SPDJB) to both of the power-fold seat relays, enabling the seats to then be moved by

pressing one of the third row power-fold seat switches. The third row power-fold seat operates only when the vehicle is in PARK and the liftgate glass, liftgate door or any entry door must be open.

The third row power-fold seat motors transfer movement to a drive gear assembly to raise and lower the seat backrest. The power-fold seat motors rotate a short torque shaft which is connected to the drive gear assembly. The power-fold seat motor and bracket assembly is serviceable separately. Refer to Power-Fold Seat Motor in this section.

Inspection and Verification

1. Verify the customer concern by operating the power seat, memory seat or climate controlled seat functions.

2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Switch(es)
• Seat tracks obstructed or damaged
• Lumbar assembly damaged
• Recliner assembly damaged (backrest frame)
• Thermo-electric device (TED) assembly filter dirty (cushion or backrest)
	• Battery junction box (BJB) fuse(s):
	  ▪ 45 (30A) (driver power seat or memory seat)
	  ▪ 29 (30A) (passenger power seat)
	  ▪ 8 (40A) (climate controlled seats)
	  ▪ 4 (30A) (left third row power-fold seat)
	  ▪ 38 (30A) (right third row power-fold seat)
	• Smart power distribution junction box (SPDJB) fuse(s):
	  ▪ 2 (15A) (memory seat)
	  ▪ 12 (7.5) (memory seat)
	  ▪ 5 (10A) (third row power-fold seats relay enable)
	• Wiring harness
	• Loose or corroded connector(s)
	• Seat control switch
	• Lumbar control switch
	• Memory set switch
	• Power seat motor (seat track)
	• Power lumbar motor (lumbar assembly)
	• Thermo-electric device (TED) assembly (cushion or backrest)
	• Power recliner motor (backrest frame)
	• Third row power-fold seat relay(s)
	• Driver seat module (DSM)
	• Climate controlled seat module (CCSM)
	• Electronic automatic temperature control (EATC) module

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern is with the power seat (non-memory seat) or the power lumbar and the cause is not visually evident, verify the symptom and GO to Symptom Chart .

5. If the concern is with the memory seat or climate controlled seat and the cause is not visually evident, connect the scan tool to the data link connector (DLC).

6. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No power to the scan tool, to diagnose no communication with the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record on-demand and continuous memory diagnostic trouble codes (DTCs).

9. Clear the continuous DTCs and carry out the self-test diagnostics for the driver seat module (DSM) or climate controlled seat module (CCSM).

10. If the DTCs retrieved are related to the concern, go to Driver Seat Module (DSM) Diagnostic Trouble Code (DTC) Chart or Climate Controlled Seat Module (CCSM) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

11. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

B2334	Tilt Steering Column Up/Down Position Feedback Circuit Short to Battery/Open Circuit	On-Demand and Continuous	REFER to Section 211-04 .
B2335	Tilt Steering Column Up/Down Position Feedback Circuit Short to GND	On-Demand and Continuous	REFER to Section 211-04 .
B2341	Tilt Steering Column Motor Stalled	On-Demand	REFER to Section 211-04 .
B2477	Module Configuration Failure	Continuous	**NOTE:** This DTC indicates programmable module installation (PMI) has not been done to a newly installed module. Presence of this DTC alone does not prevent basic seat operation from the seat

			control switch. CARRY OUT programmable module installation (PMI) on the DSM. REFER to Section 418-01 . REPEAT the self-test and VERIFY successful PMI. CLEAR the DTCs.
B2A1B	Hall Sensor Feed Circuit Short to Battery	On-Demand and Continuous	If present as an on-demand DTC: Depower the supplemental restraint system (SRS). Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . DISCONNECT the driver seat safety belt buckle pretensioner C3049. DISCONNECT the driver seat side air bag C3051. DISCONNECT DSM C341c. CONNECT the battery ground cable. With the ignition switch ON, MEASURE the voltage between C341c-12, circuit RPS13 (GN/OG), harness side and ground. REPAIR the short to voltage as needed. If OK, INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. CONNECT driver seat safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
B2A1C	Hall Sensor Feed Circuit Short to Ground	On-Demand and Continuous	If present as an on-demand DTC: Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . DISCONNECT the driver seat safety belt buckle pretensioner C3049. DISCONNECT the driver seat side air bag C3051. DISCONNECT DSM C341c. CONNECT the battery ground cable. MEASURE the resistance between C341c-12, circuit RPS13 (GN/OG), harness side and ground. REPAIR the short to ground as needed. If OK, INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. CONNECT driver seat safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
B2A1D	Potentiometer Feed Circuit Short to Battery	On-Demand and Continuous	REFER to Diagnostic Trouble Code Chart in Section 419-10 .
B2A1E	Potentiometer Feed Circuit Short to Ground	On-Demand and Continuous	REFER to Diagnostic Trouble Code Chart in Section 419-10 .
B2A42	Tilt Steering Column Up Switch Circuit Short to Ground	On-Demand and Continuous	REFER to Section 211-04 .
B2A43	Tilt Steering Column Down Switch Circuit Short to Ground	On-Demand and Continuous	REFER to Section 211-04 .
U0140	Lost Communication With Body Control Module	Continuous	REPAIR all other DTCs first. REFER to Section 418-00 to diagnose the MS-CAN network concern.

	(GEM)		
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	Continuous	REPAIR all other DTCs first. REFER to Section 418-00 to diagnose the MS-CAN network concern.
U2050	Application Not Present	Continuous	**NOTE:** This DTC is set only during a module re-flash that did not complete correctly. RE-FLASH the DSM using the latest version of software data available. REFER to Section 418-01 . REPEAT the self-test. If the DTC is retrieved again, CHECK the connection to the data link connector (DLC) and REPEAT module re-flash. REPEAT the self-test. CLEAR the DTCs.
U2471	Unexpected PRNDL State	On-Demand	**NOTE:** This DTC is set during a self-test if the PRNDL state is not PARK or NEUTRAL or is changed from either position while the self-test is in progress. VERIFY the transmission gear selector (PRNDL) is in PARK or NEUTRAL. REPEAT the self-test. CLEAR the DTCs. If the DTC is retrieved again, REFER to Section 307-01A or Section 307-01B to diagnose a transmission gear selector status concern.

Smart Power Distribution Junction Box (SPDJB) Diagnostic Trouble Code (DTC) Chart

NOTE: Only the third row power fold seating DTCs are listed. For all SPDJB DTCs, refer to Section 419-10 .

DTC	Description	Retrieved	Action
B2794	Third Row Power Fold Circuit Failure	On-Demand	Go To Pinpoint Test R .
B2A2D	Third Row Power Fold Circuit Short to Ground	Continuous	Go To Pinpoint Test R .

Climate Controlled Seat Module (CCSM) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Retrieved	Action
B103B	Thermoelectric Driver Overcurrent Low	On-Demand and Continuous	Go To Pinpoint Test U .
B103C	Thermoelectric Driver Open Load	On-Demand and Continuous	Go To Pinpoint Test V .

B1342	ECU is Faulted	On-Demand and Continuous	INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section.
B19A1	Passenger Seat Cushion Blower Speed Short to Battery	On-Demand and Continuous	DEPOWER the supplemental restraint system (SRS). REFER to Section 501-20B . DISCONNECT passenger seat safety belt buckle pretensioner C3050. DISCONNECT passenger seat side air bag module C3052. DISCONNECT CCSM C3265c and passenger cushion TED C3040. CONNECT the battery ground cable. With the ignition switch ON, MEASURE the voltage between C3265c-3, circuit RHS08 (VT/WH), harness side and ground. REPAIR the short to voltage as needed. If OK, INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
B19A2	Passenger Seat Back Blower Speed Short to Battery	On-Demand and Continuous	DEPOWER the supplemental restraint system (SRS). REFER to Section 501-20B . DISCONNECT passenger seat safety belt buckle pretensioner C3050. DISCONNECT passenger seat side air bag module C3052. DISCONNECT CCSM C3265c and passenger backrest TED C3039 (10-way power seat) or C3316 (6-way power seat). CONNECT the battery ground cable. With the ignition switch ON, MEASURE the voltage between C3265c-4, circuit CHS09 (GY), harness side and ground. REPAIR the short to voltage as needed. If OK, INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
B19A3	Driver Seat Cushion Blower Speed Short	On-Demand and	DEPOWER the supplemental restraint system (SRS). REFER to Section 501-20B . DISCONNECT driver seat

	to Battery	Continuous	safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. DISCONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. DISCONNECT CCSM C3265c and driver cushion TED C3035. CONNECT the battery ground cable. With the ignition switch ON, MEASURE the voltage between C3265c-11, circuit RHS03 (GY/OG), harness side and ground. REPAIR the short to voltage as needed. If OK, INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
B19A4	Driver Seat Back Blower Speed Short to Battery	On-Demand and Continuous	DEPOWER the supplemental restraint system (SRS). REFER to Section 501-20B . DISCONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. DISCONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. DISCONNECT CCSM C3265c and driver backrest TED C3034. CONNECT the battery ground cable. With the ignition switch ON, MEASURE the voltage between C3265c-12, circuit CHS04 (YE/GN), harness side and ground. REPAIR the short to voltage as needed. If OK, INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
B19A5	Passenger Seat Cushion Blower Speed Short to Ground	On-Demand and Continuous	DEPOWER the supplemental restraint system (SRS). REFER to Section 501-20B . DISCONNECT passenger seat safety belt buckle pretensioner C3050. DISCONNECT passenger seat side air bag module C3052. DISCONNECT CCSM C3265c and passenger cushion TED C3040. CONNECT the battery ground cable. MEASURE the resistance between C3265c-3, circuit RHS08 (VT/WH), harness side and ground. REPAIR the short to ground as needed. If OK, INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
B19A6	Passenger Seat Back Blower Speed	On-Demand and	DEPOWER the supplemental restraint system (SRS). REFER to Section 501-20B . DISCONNECT passenger

	Short to Ground	Continuous	seat safety belt buckle pretensioner C3050. DISCONNECT passenger seat side air bag module C3052. DISCONNECT CCSM C3265c and passenger backrest TED C3039 (10-way power seat) or C3316 (6-way power seat). CONNECT the battery ground cable. MEASURE the resistance between C3265c-4, circuit CHS09 (GY), harness side and ground. REPAIR the short to voltage as needed. If OK, INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
B19A7	Driver Seat Cushion Blower Speed Short to Ground	On-Demand and Continuous	DEPOWER the supplemental restraint system (SRS). REFER to Section 501-20B . DISCONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. DISCONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. DISCONNECT CCSM C3265c and driver cushion TED C3035. CONNECT the battery ground cable. MEASURE the resistance between C3265c-11, circuit RHS03 (GY/OG), harness side and ground. REPAIR the short to ground as needed. If OK, INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
B19A8	Driver Seat Back Blower Speed Short to Ground	On-Demand and Continuous	DEPOWER the supplemental restraint system (SRS). REFER to Section 501-20B . DISCONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. DISCONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. DISCONNECT CCSM C3265c and driver backrest TED C3034. CONNECT the battery ground cable. MEASURE the resistance between C3265c-12, circuit CHS04 (YE/GN), harness side and ground. REPAIR the short to ground as needed. If OK, INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
B2477	Module Configuration Failure	On-Demand and	This DTC indicates programmable module installation (PMI) has not been done to a newly installed module.

		Continuous	CARRY OUT PMI. REFER to Section 418-01 . REPEAT the self-test. CLEAR the DTCs.
B2486	Climate Control Seat Module Voltage Out of Range	On-Demand and Continuous	REFER to Section 414-00 to diagnose the charging system concern.
B2729	Cushion Over-Temp Detected (Driver)	On-Demand and Continuous	Go To Pinpoint Test AA .
B272A	Passenger Cushion Over-Temp Detected	On-Demand and Continuous	Go To Pinpoint Test AB .
B272B	Passenger Back Over-Temp Detected	On-Demand and Continuous	Go To Pinpoint Test AC .
B272C	Driver Differential Temperature Fault	On-Demand and Continuous	Go To Pinpoint Test AD .
B272D	Passenger Differential Temperature Fault	On-Demand and Continuous	Go To Pinpoint Test AE .
B2730	Back Over-Temp Detected (Driver)	On-Demand and Continuous	Go To Pinpoint Test AF .
B6050	No Application Present	—	REFLASH with the latest operational software. REFER to Section 418-01 . REPEAT the self-test. CLEAR the DTCs. If the DTC does not clear, or is retrieved again, REFLASH with the latest operational software again. REPEAT the self-test. CLEAR the DTCs. If the DTC does not clear, or is again retrieved from the self-test, INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the driver seat module (DSM)	• Fuse • Circuitry • DSM	• REFER to Section 418-00 .
• No communication with the climate control seat module (CCSM)	• Fuse • Circuitry • CCSM	• REFER to Section 418-00 .
• No communication with the module — unable to carry out on-demand self test with the DSM	• Fuse(s) • Circuitry • DSM	• REFER to Section 418-00 .
• The power seat is inoperative — driver, with power recliner	• Fuse • Circuitry • Seat control switch	• Go To Pinpoint Test A .
• The power seat is	• Fuse	• Go To Pinpoint Test B .

inoperative — driver, without power recliner	• Seat control switch • Circuitry	
• The power seat is inoperative — passenger, with power recliner	• Fuse • Circuitry • Seat control switch	• Go To Pinpoint Test C .
• The power seat is inoperative — passenger, without power recliner	• Fuse • Seat control switch • Circuitry	• Go To Pinpoint Test D .
• The power seat moves but is loose	• Fastening hardware • Seat track	• Go To Pinpoint Test E .
• The power seat moves but is noisy	• Seat track	• Go To Pinpoint Test F .
• The power seat does not make full travel	• Seat track obstructed • Seat track	• Go To Pinpoint Test G .
• The power seat does not move horizontally/vertically/recline — driver	• Seat track • Circuitry • Seat control switch • Power seat motor	• Go To Pinpoint Test H .
• The power seat does not move horizontally/vertically — driver	• Seat track • Circuitry • Seat control switch • Power seat motor	• Go To Pinpoint Test I .
• The power seat does not move horizontally/vertically/recline — passenger	• Seat track • Circuitry • Seat control switch • Power seat motor	• Go To Pinpoint Test J .
• The power seat does not move horizontally/vertically — passenger	• Circuitry • Seat track • Seat control switch • Power seat motor	• Go To Pinpoint Test K .
• The memory seat is inoperative/does not operate correctly — does not operate horizontally/vertically/recline	• Fuse • Circuitry • Seat control switch • Seat track • DSM • Power seat motor	• Go To Pinpoint Test L .
• The memory seat does not operate correctly — the seat moves in one second intervals	• Circuitry • Seat track • DSM	• REFER to the DTC Chart.
• The memory seat does not operate correctly — does not	• Circuitry • Memory set	• Go To Pinpoint Test M .

operate using the memory set switch	switch • Seat track • DSM	
• The memory seat does not operate correctly — does not operate using the remote transmitter	• Remote keyless entry (RKE) transmitter is not correctly associated to a memory position • Circuitry • Keyless entry transmitter • DSM • Vehicle security module (VSM)	• VERIFY the RKE transmitter is operating correctly and is associated to a memory position. REFER to Principles of Operation or the Owner's Literature for additional information on associating a RKE transmitter. For a RKE transmitter function concern, REFER to Section 501-14 . RUN the DSM self-test and REFER to the DTC Chart to diagnose any DTCs retrieved.
• Easy exit/easy entry is inoperative/not operating correctly	• Circuitry • Key in ignition switch • Instrument Cluster • DSM	• Go To Pinpoint Test N .
• The power lumbar is inoperative — driver	• Circuitry • Lumbar control switch • Power lumbar assembly • Power lumbar motor	• Go To Pinpoint Test O .
• The power lumbar is inoperative — passenger	• Circuitry • Lumbar control switch • Power lumbar assembly • Power lumbar motor	• Go To Pinpoint Test P .
• All climate controlled seats are inoperative	• Fuse • Circuitry • CCSM • EATC module	• VERIFY battery junction box (BJB) fuse 8 (40A) is OK. If OK, CARRY OUT the Data Links Diagnostics test using a scan tool and verify network communication of the EATC and CCSM. REFER to Section 418-00 to diagnose a module communication or network concern. If OK, CARRY OUT the CCSM on-demand self test and retrieve any DTCs. If any DTC is present, REFER to the Climate Controlled Seat Module (CCSM)

		Diagnostic Trouble Code (DTC) Chart. CHECK the climate control system for correct operation. REFER to Section 412-00 for diagnosis of the EATC or climate control system. If OK, INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section.
• A single climate controlled seat is inoperative/does not operate correctly	• Circuitry • MS-CAN network communication fault • EATC module • CCSM	• **NOTE:** If a fault occurs setting a DTC specific to only one climate controlled seat, the CCSM will disable only the affected seat outputs and allow the other seat to remain operational. CHECK for DTCs specific to the affected climate controlled seat and, if a DTC is present, REFER to the Climate Controlled Seat Module (CCSM) Diagnostic Trouble Code (DTC) Chart. Go To Pinpoint Test Q .
• A single climate controlled seat does not operate correctly — exhibits poor airflow or performance	• Incorrectly installed thermo-electric device (TED), manifold or plenum • Airflow blockage • Disconnected air duct	• CARRY OUT the CCSM on-demand self test and retrieve any DTCs. If any DTC is present, REFER to the Climate Controlled Seat Module (CCSM) Diagnostic Trouble Code (DTC) Chart. If no DTC is present, CHECK the affected seat cushion or backrest for correct installation of the climate controlled seat components (TED, manifold, plenum, air ducts and foam pad) and REPAIR as needed. If OK, CHECK for airflow restrictions (TED inlets and outlets, TED-to-manifold or plenum connections, filters and ducts) and REPAIR as needed.

		RETEST the system for normal operation.
• A second row E-Z entry seat does not operate correctly — seat stuck in E-Z entry position	• Incorrect shipping pin position	• CHECK the shipping pin at the seat pedestal pivot is in the released position. REFER to Seat — Second Row, 40 Percent for additional information.
• The power seat is inoperative — third row power-fold, left and right seats	• Fuse(s) • Circuitry • Smart power distrubution junction box (SPDJB)	• Go To Pinpoint Test R .
• The power seat is inoperative/does not operate correctly — third row power-fold, left seat	• Fuse(s) • Circuitry • Power-fold seat relay • Seat control switch(es) • Power-fold seat motor	• Go To Pinpoint Test S .
• The power seat is inoperative/does not operate correctly — third row power-fold, right seat	• Fuse(s) • Circuitry • Power-fold seat relay • Seat control switch(es) • Power-fold seat motor	• Go To Pinpoint Test T .

Pinpoint Tests

CAUTION: Electronic modules are sensitive to electrostatic discharge. If exposed to these charges, damage can result.

Refer to Inspection and Verification, the Driver Seat Module (DSM) Diagnostic Trouble Code (DTC) Chart, Climate Controlled Seat Module (CCSM) Diagnostic Trouble Code (DTC) Chart, Smart Power Distribution Junction Box (SPDJB) Diagnostic Trouble Code (DTC) Chart and the Symptom Chart for direction to the appropriate pinpoint test.

Pinpoint Test A: The Power Seat is Inoperative — Driver, With Power Recliner

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBB45 (GY/RD) and is supplied ground on circuit GD143 (BK/VT). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor or power recline motor to move the seat or backrest. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor or power recline motor, which moves the seat or backrest in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). There is an additional motor in the power recline mechanism

to move the seat backrest forward and rearward. If a new seat track motor needs to be installed, it is necessary to install an entire power seat track.

Possible Causes

An inoperative driver power seat can be caused by:

- a fuse.
- wiring, terminals or connectors.
- a faulty seat control switch.

PINPOINT TEST A: THE POWER SEAT IS INOPERATIVE — DRIVER, WITH POWER RECLINER

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
A1 CHECK CIRCUIT SBB45 (GY/RD) FOR VOLTAGE • Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • Disconnect: Driver Seat Control Switch C3016. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between driver seat control switch C3016-5, circuit SBB45 (GY/RD), harness side and ground.  N0010816 • **Is the voltage greater than 10 volts?**	**Yes** GO to A2 . **No** VERIFY battery junction box (BJB) fuse 45 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
A2 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN • Measure the resistance between driver seat control switch C3016-3, circuit GD143 (BK/VT), harness side and ground.	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery

 N0010815 • **Is the resistance less than 5 ohms?**	ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test B: The Power Seat is Inoperative — Driver, Without Power Recliner

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBB45 (GY/RD) and is supplied ground on circuit GD143 (BK/VT). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new seat track motor needs to be installed, it is necessary to install an entire power seat track.

Possible Causes

An inoperative driver power seat can be caused by:

- a fuse.
- wiring, terminals or connectors.
- a faulty seat control switch.

PINPOINT TEST B: THE POWER SEAT IS INOPERATIVE — DRIVER, WITHOUT POWER RECLINER

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
B1 CHECK CIRCUIT SBB45 (GY/RD) FOR VOLTAGE • Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • Disconnect: Driver Seat Control Switch C352. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between driver seat control switch C352-4, circuit SBB45 (GY/RD), harness side and ground.  N0010817 • **Is the voltage greater than 10 volts?**	**Yes** GO to B2 . **No** VERIFY battery junction box (BJB) fuse 45 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
B2 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN • Measure the resistance between driver seat control switch C352-2, circuit GD143 (BK/VT), harness side and ground.  N0010818 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051.

	REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test C: The Power Seat is Inoperative — Passenger, With Power Recliner

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

The passenger seat control switch is powered by battery voltage on circuit SBB29 (GY/RD) and is supplied ground on circuit GD138 (BK/WH). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new seat track motor needs to be installed, it is necessary to install an entire power seat track.

Possible Causes

An inoperative passenger power seat can be caused by:

- a fuse.
- wiring, terminals or connectors.
- a faulty seat control switch.

PINPOINT TEST C: THE POWER SEAT IS INOPERATIVE — PASSENGER (WITH POWER RECLINER)

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
C1 CHECK CIRCUIT SBB29 (GY/RD) FOR VOLTAGE • Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the passenger seat safety belt buckle pretensioner C3050. • Disconnect the passenger seat side air bag C3052. • Disconnect: Passenger Seat Control Switch C3026. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between passenger seat control switch C3026-5, circuit SBB29 (GY/RD), harness side and ground.	**Yes** GO to C2 . **No** VERIFY battery junction box (BJB) fuse 29 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.

 N0010819 • **Is the voltage greater than 10 volts?**	REPOWER the SRS. REFER to Section 501-20B .
C2 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Measure the resistance between passenger seat control switch C3026-3, circuit GD138 (BK/WH), harness side and ground.  N0010825 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test D: The Power Seat is Inoperative — Passenger, Without Power Recliner

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

The passenger seat control switch is powered by battery voltage on circuit SBB29 (GY/RD) and is supplied ground on circuit GD138 (BK/WH). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in

the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new seat track motor needs to be installed, it is necessary to install an entire power seat track.

Possible Causes

An inoperative passenger power seat can be caused by:

- a fuse.
- wiring, terminals or connectors.
- a faulty seat control switch.

PINPOINT TEST D: THE POWER SEAT IS INOPERATIVE — PASSENGER, WITHOUT POWER RECLINER

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
D1 CHECK CIRCUIT SBB29 (GY/RD) FOR VOLTAGE	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the passenger seat safety belt buckle pretensioner C3050. • Disconnect the passenger seat side air bag C3052. • Disconnect: Passenger Seat Control Switch C355. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between passenger seat control switch C355-4, circuit SBB29 (GY/RD), harness side and ground.  N0010817 • **Is the voltage greater than 10 volts?**	**Yes** GO to D2 . **No** VERIFY battery junction box (BJB) fuse 29 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
D2 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Measure the resistance between passenger seat control switch C355-2, circuit GD138 (BK/WH), harness side and ground.	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch — Front . TEST the system for

 N0010818 • **Is the resistance less than 5 ohms?**	normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test E: The Power Seat Moves But is Loose

Normal Operation

The power seat movement should be smooth and the seat cushion should not rock during or after operation.

Possible Causes

A loose power seat can be caused by:

- loose fastening hardware.
- a faulty seat track component.

PINPOINT TEST E: THE POWER SEAT MOVES BUT IS LOOSE

Test Step	Result / Action to Take
E1 CHECK THE FASTENING HARDWARE	
• Key in OFF position. • Inspect for loose fastening hardware on the affected seat. • **Is the fastening hardware loose?**	**Yes** TIGHTEN all fastening hardware to specification. TEST the system for normal operation. **No** IDENTIFY the cause and REPAIR as necessary.

	TEST the system for normal operation.

Pinpoint Test F: The Power Seat Moves But is Noisy

Normal Operation

The power seat should move quietly during operation. Some noise is acceptable.

Possible Causes

A noisy power seat can be caused by:

- a misaligned seat track.
- a faulty seat track component.
- an object obstructing seat movement.

PINPOINT TEST F: THE POWER SEAT MOVES BUT IS NOISY

Test Step	Result / Action to Take
F1 CHECK THE TRACK ALIGNMENT	
• Check the alignment of the track to the floor and the track to the seat. • **Is the track out of alignment?**	**Yes** ALIGN the track to the seat and the floor. TEST the system for normal operation. **No** IDENTIFY the cause and REPAIR as necessary. TEST the system for normal operation.

Pinpoint Test G: The Power Seat Does Not Make Full Travel

Normal Operation

The power seat should travel fully horizontal (forward/rearward) and vertical (front up/down and rear up/down).

Possible Causes

A power seat that does not make full travel can be caused by:

- an obstruction.
- a faulty seat track component.

PINPOINT TEST G: THE POWER SEAT DOES NOT MAKE FULL TRAVEL

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
G1 CHECK FOR AN OBSTRUCTION IN THE SEAT TRACK	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Remove the affected seat. Refer to Seat — Front, 40 Percent in this section. • **Are there any obstructions in the track?**	**Yes** REMOVE the obstruction(s) and LUBRICATE the track(s). REPOWER the SRS. REFER to Section 501-20B . TEST the system for normal operation. **No** IDENTIFY the cause and REPAIR as necessary. REPOWER the SRS. REFER to Section 501-20B . TEST the system for normal operation.

Pinpoint Test H: The Power Seat Does Not Move Horizontally/Vertically/Recline — Driver

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBB45 (GY/RD) and is supplied ground on circuit GD143 (BK/VT). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor or power recline motor to move the seat or backrest. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor or power recline motor, which moves the seat or backrest in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). There is an additional motor in the power recline mechanism to move the seat backrest forward and rearward. If a new seat track motor needs to be installed, it is necessary to install an entire power seat track. The power recliner motor is serviced with the seat backrest frame.

Possible Causes

A driver power seat that does not move horizontally and/or vertically can be caused by:

- wiring, terminals or connectors.
- a faulty seat control switch.
- a faulty seat track motor (seat track).
- a faulty power recliner mechanism.

PINPOINT TEST H: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY/RECLINE — DRIVER

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take

H1 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION	
• Operate the driver power seat forward and rearward. • **Will the seat move horizontally?**	**Yes** GO to H2 . **No** GO to H3 .
H2 CHECK THE RECLINER MOTOR FOR CORRECT OPERATION	
• Recline the driver backrest forward and rearward. • **Will the seat backrest recline forward and rearward?**	**Yes** GO to H6 . **No** GO to H13 .
H3 CHECK VOLTAGE TO THE DRIVER SEAT HORIZONTAL MOTOR	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • Disconnect: Driver Seat Motor C362. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between driver seat horizontal motor C362-1, circuit CPS28 (GN), harness side and C362-2, circuit CPS23 (GN/VT), harness side, while pushing the driver seat control switch forward and rearward.  N0052984 • **Is the voltage greater than -10 volts when the switch is pushed forward, greater than +10 volts when the switch is pushed rearward and 0 volt when the switch is in a rest position?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to H4 .
H4 CHECK CIRCUIT CPS28 (GN) FOR AN OPEN	
• Disconnect: Driver Seat Control Switch C3016. • Measure the resistance between driver seat control switch C3016-9, circuit CPS28 (GN), harness side and driver seat horizontal motor C362-1, circuit CPS28 (GN), harness side.	**Yes** GO to H5 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle

 N0055029 • **Is the resistance less than 5 ohms?**	pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
H5 CHECK CIRCUIT CPS23 (GN/VT) FOR AN OPEN	
• Measure the resistance between driver seat control switch C3016-4, circuit CPS23 (GN/VT), harness side and driver seat horizontal motor C362-2, circuit CPS23 (GN/VT), harness side.  N0055030 • **Is the resistance less than 5 ohms ?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
H6 DETERMINE THE SEAT HEIGHT ADJUST FAILURE	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • **WARNING: Be sure that nobody is in the vehicle and**	**Yes** If only front height adjust operates, GO to H7 . If only rear height adjust operates, GO to H10 . **No** INSTALL a new driver

that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected. • Connect the battery ground cable. • Determine the seat height adjust failure. • **Does the seat front or rear height adjust up and down?**	seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
H7 CHECK VOLTAGE TO THE DRIVER SEAT REAR HEIGHT MOTOR	
• Disconnect: Driver Seat Rear Height Motor C363. • Measure the voltage between driver seat rear height motor C363-1, circuit CPS27 (BU/BN), harness side and C363-2, circuit CPS26 (YE/BU), harness side, while depressing the seat control switch rear height adjust up and down.  N0052984 • **Is the voltage greater than -10 volts when the rear height adjust is pressed down, greater than +10 volts when the rear height adjust is pressed up and 0 volt when the switch is in the rest position?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to H8 .
H8 CHECK CIRCUIT CPS27 (BU/BN) FOR AN OPEN	
• Disconnect: Driver Seat Control Switch C3016. • Measure the resistance between driver seat control switch C3016-1, circuit CPS27 (BU/BN), harness side and driver seat rear height motor C363-1, circuit CPS27 (BU/BN), harness side.  N0055031 • **Is the resistance less than 5 ohms?**	**Yes** GO to H9 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051.

	REPOWER the SRS. REFER to Section 501-20B .
H9 CHECK CIRCUIT CPS26 (YE/BU) FOR AN OPEN	
• Measure the resistance between driver seat control switch C3016-12, circuit CPS26 (YE/BU), harness side and driver seat rear height motor C363-2, circuit CPS26 (YE/BU), harness side.  N0055032 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
H10 CHECK VOLTAGE TO DRIVER SEAT FRONT HEIGHT MOTOR	
• Disconnect: Driver Seat Front Height Motor C382. • Measure the voltage between driver seat rear height motor C382-1, circuit CPS25 (WH/VT), harness side and C382-2, circuit CPS24 (GY), while pushing the seat control switch rear height adjust up and down.  N0052984 • **Is the voltage greater than -10 volts when the front height**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051.

adjust is pressed down, greater than +10 volts when the front height adjust is pressed up and 0 volt when the switch is in the rest position?	REPOWER the SRS. REFER to Section 501-20B . **No** GO to H11 .
H11 CHECK CIRCUIT CPS25 (WH/VT) FOR AN OPEN AND SHORT TO GROUND • Disconnect: Driver Seat Control Switch C3016. • Measure the resistance between driver seat control switch C3016-2, circuit CPS25 (WH/VT), harness side and driver seat front height motor C382-1, circuit CPS25 (WH/VT), harness side.  N0055033 • **Is the resistance less than 5 ohms?**	**Yes** GO to H12 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
H12 CHECK CIRCUIT CPS24 (GY) FOR AN OPEN • Measure the resistance between driver seat control switch C3016-6, circuit CPS24 (GY) harness side, and driver seat front height motor C382-2, circuit CPS24 (GY), harness side.  N0055034 • **Is the resistance less than 5 ohms ?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat

	side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
H13 CHECK VOLTAGE TO THE DRIVER SEAT RECLINER MOTOR	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • Disconnect: Driver Seat Recliner Motor C3187. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between driver seat recliner motor C3187-1, circuit CPS08 (VT/OG), harness side and C3187-2, circuit CPS07 (GY/BN), while pushing the recline switch forward and rearward.  N0010826 • **Is the voltage greater than +10 volts when the switch is pushed forward, greater than -10 volts when the switch is pushed rearward and 0 volt when the switch is in a rest position?**	**Yes** INSTALL a new driver seat recliner motor. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to H14 .
H14 CHECK CIRCUITS CPS29 (WH/BN) AND CPS07 (GY/BN) FOR AN OPEN	
• Disconnect: Driver Seat Control Switch C3016. • Measure the resistance between driver seat control switch C3016-11, circuit CPS29 (WH/BN), harness side and driver seat recliner motor C3187-2, circuit CPS07 (GY/BN), harness side.  N0055035 • **Is the resistance less than 5 ohms?**	**Yes** GO to H15 . **No** REPAIR the affected circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-

	20B .
H15 CHECK CIRCUITS CPS30 (VT/BN) AND CPS08 (VT/OG) FOR AN OPEN	
• Measure the resistance between driver seat control switch C3016-8, circuit CPS30 (VT/BN) harness side, and driver seat recliner motor C3187-1, circuit CPS08 (VT/OG), harness side.  N0055036 • **Is the resistance less than 5 ohms ?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test I: The Power Seat Does Not Move Horizontally/Vertically — Driver

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBB45 (GY/RD) and is supplied ground on circuit GD143 (BK/VT). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new motor needs to be installed, it is necessary to install an entire power seat track.

Possible Causes

A driver power seat that does not move horizontally and/or vertically can be caused by:

- wiring, terminals or connectors.
- a faulty seat control switch.
- a faulty seat track motor (seat track).

PINPOINT TEST I: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY — DRIVER

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
I1 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION	
• Operate the driver power seat forward and rearward. • **Will the seat move horizontally?**	**Yes** GO to I5 . **No** GO to I2 .
I2 CHECK VOLTAGE TO THE DRIVER SEAT HORIZONTAL MOTOR	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • Disconnect: Driver Seat Horizontal Motor C362. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between driver seat horizontal motor C362-1, circuit CPS28 (GN), harness side and C362-2, circuit CPS23 (GN/VT), harness side, while pushing the driver seat control switch forward and rearward.  N0052984 • **Is the voltage greater than -10 volts when the switch is pushed forward, greater than +10 volts when the switch is pushed rearward and 0 volt when the switch is in a rest position?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to I3 .
I3 CHECK CIRCUIT CPS28 (GN) FOR AN OPEN	
• Disconnect: Driver Seat Control Switch C352.	**Yes**

• Measure the resistance between driver seat control switch C352-6, circuit CPS28 (GN), harness side and driver seat horizontal motor C362-1, circuit CPS28 (GN), harness side.  N0055037 • **Is the resistance less than 5 ohms ?**	GO to I4 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
I4 CHECK CIRCUIT CPS23 (GN/VT) FOR AN OPEN	
• Measure the resistance between driver seat control switch C352-3, circuit CPS23 (GN/VT), harness side and driver seat horizontal motor C362-2, circuit CPS23 (GN/VT), harness side.  N0055038 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. If equipped, CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
I5 DETERMINE THE SEAT HEIGHT ADJUST FAILURE	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System	**Yes** If only front height adjust

(SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Determine the seat height adjust failure. • **Does the seat front or rear height adjust up and down?**	operates, GO to I6 . If only rear height adjust operates, GO to I9 . **No** INSTALL a new driver seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
I6 CHECK VOLTAGE TO THE DRIVER SEAT REAR HEIGHT MOTOR	
• Disconnect: Driver Seat Rear Height Motor C363. • Measure the voltage between driver seat rear height motor C363-1, circuit CPS27 (BU/BN), harness side and C363-2, circuit CPS26 (YE/BU), harness side, while depressing the seat control switch rear height adjust up and down.  N0052984 • **Is the voltage greater than -10 volts when the rear height adjust is pressed down, greater than +10 volts when the rear height adjust is pressed up and 0 volt when the switch is in the rest position?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to I7 .
I7 CHECK CIRCUIT CPS27 (BU/BN) FOR AN OPEN	
• Disconnect: Driver Seat Control Switch C352. • Measure the resistance between driver seat control switch C352-5, circuit CPS27 (BU/BN), harness side and driver seat rear height motor C363-1, circuit CPS27 (BU/BN), harness side.	**Yes** GO to I8 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT

 N0055040 • **Is the resistance less than 5 ohms ?**	driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
I8 CHECK CIRCUIT CPS26 (YE/BU) FOR AN OPEN	
• Measure the resistance between driver seat control switch C352-7, circuit CPS26 (YE/BU), harness side and driver seat rear height motor C363-2, circuit CPS26 (YE/BU), harness side.  N0055041 • **Is the resistance less than 5 ohms ?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
I9 CHECK THE VOLTAGE TO THE DRIVER SEAT FRONT HEIGHT MOTOR	
• Disconnect: Driver Seat Front Height Motor C382. • Measure the voltage between driver seat front height motor C382-1, circuit CPS25 (WH/VT), harness side and C382-2, circuit CPS24 (GY), while pushing the seat control switch rear height adjust up and down.	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. TEST the system for normal operation.

 N0052984 • **Is the voltage greater than +10 volts when the front height adjust is pressed down, greater than -10 volts when the front height adjust is pressed up and 0 volt when the switch is in the rest position?**	DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to I10 .
I10 CHECK CIRCUIT CPS25 (WH/VT) FOR AN OPEN	
• Disconnect: Driver Seat Control Switch C352. • Measure the resistance between driver seat control switch C352-1, circuit CPS25 (WH/VT), harness side and driver seat front height motor C382-1, circuit CPS25 (WH/VT), harness side.  N0055042 • **Is the resistance less than 5 ohms?**	**Yes** GO to I11 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
I11 CHECK CIRCUIT CPS24 (GY) FOR AN OPEN	
• Measure the resistance between driver seat control switch C352-8, circuit CPS24 (GY) harness side, and driver seat front height motor C382-2, circuit CPS24 (GY), harness side.  N0055043 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal

	operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test J: The Power Seat Does Not Move Horizontally/Vertically/Recline — Passenger

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

The passenger seat control switch is powered by battery voltage on circuit SBB29 (GY/RD) and is supplied ground on circuit GD138 (BK/WH). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor or power recline motor to move the seat or backrest. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor or power recline motor, which moves the seat or backrest in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). There is an additional motor in the power recline mechanism to move the seat backrest forward and rearward. If a new seat track motor needs to be installed, it is necessary to install an entire power seat track. The power recline motor is serviced with the backrest frame.

Possible Causes

A passenger power seat that does not move horizontally and/or vertically can be caused by:

- wiring, terminals or connectors.
- a faulty seat control switch.
- a faulty seat track motor (seat track).
- a faulty power recliner mechanism.

PINPOINT TEST J: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY/RECLINE — PASSENGER

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
J1 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION	
• Operate the passenger power seat forward and rearward. • **Will the seat move horizontally?**	**Yes** GO to J2 .

	No GO to J3 .
J2 CHECK THE RECLINER MOTOR FOR CORRECT OPERATION	
• Recline the passenger backrest forward and rearward. • **Will the seat backrest recline forward and rearward?**	**Yes** GO to J6 . **No** GO to J13 .
J3 CHECK VOLTAGE TO THE PASSENGER SEAT HORIZONTAL MOTOR	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the passenger seat safety belt buckle pretensioner C3050. • Disconnect the passenger seat side air bag C3052. • Disconnect: Passenger Seat Horizontal Motor C332. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between passenger seat motor C332-1, circuit CPS38 (GN/BU), harness side and C332-2, circuit CPS33 (WH), harness side, while pushing the passenger seat control switch forward and rearward.  N0052984 • **Is the voltage greater than +10 volts when the switch is pushed forward, greater than -10 volts when the switch is pushed rearward and 0 volt when the switch is in a rest position?**	**Yes** INSTALL a new passenger seat track assembly. REFER to Seat Track — Power in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to J4 .
J4 CHECK CIRCUIT CPS38 (GN/BU) FOR AN OPEN	
• Disconnect: Passenger Seat Control Switch C3026. • Measure the resistance between passenger seat control switch C3026-9, circuit CPS38 (GN/BU), harness side and passenger seat horizontal motor C332-1, circuit CPS38 (GN/BU), harness side.  N0055029	**Yes** GO to J5 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.

• **Is the resistance less than 5 ohms?**	REPOWER the SRS. REFER to Section 501-20B .
J5 CHECK CIRCUIT CPS33 (WH) FOR AN OPEN	
• Measure the resistance between passenger seat control switch C3026-4, circuit CPS33 (WH), harness side and passenger seat horizontal motor C332-2, circuit CPS33 (WH), harness side.  N0055030 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
J6 DETERMINE THE SEAT HEIGHT ADJUST FAILURE	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the passenger seat safety belt buckle pretensioner C3050. • Disconnect the passenger seat side air bag C3052. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Determine the seat height adjust failure. • **Does the seat front or rear height adjust up and down?**	**Yes** If only front height adjust operates, GO to J7 . If only rear height adjust operates, GO to J10 . **No** INSTALL a new passenger seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation.

	DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
J7 CHECK VOLTAGE TO THE PASSENGER SEAT REAR HEIGHT MOTOR • Disconnect: Passenger Seat Rear Height Motor C3075. • Measure the voltage between passenger seat rear height motor C3075-1, circuit CPS37 (WH/BU), harness side and C3075-2, circuit CPS36 (YE/GY), harness side, while depressing the seat control switch rear height adjust up and down.  N0052984 • **Is the voltage greater than -10 volts when the rear height adjust is pressed down, greater than +10 volts when the rear height adjust is pressed up and 0 volt when the switch is in the rest position?**	**Yes** INSTALL a new passenger seat track assembly. REFER to Seat Track — Power in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to J8 .
J8 CHECK CIRCUIT CPS37 (WH/BU) FOR AN OPEN • Disconnect: Passenger Seat Control Switch C3026. • Measure the resistance between passenger seat control switch C3026-12, circuit CPS37 (WH/BU), harness side and passenger seat rear height motor C3075-1, circuit CPS37 (WH/BU), harness side.  N0055031 • **Is the resistance less than 5 ohms ?**	**Yes** GO to J9 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

J9 CHECK CIRCUIT CPS36 (YE/GY) FOR AN OPEN	
• Measure the resistance between passenger seat control switch C3026-1, circuit CPS36 (YE/GY), harness side and passenger seat rear height motor C3075-2, circuit CPS36 (YE/GY), harness side.  N0055032 • **Is the resistance less than 5 ohms ?**	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
J10 CHECK VOLTAGE TO PASSENGER SEAT FRONT HEIGHT MOTOR	
• Disconnect: Passenger Seat Front Height Motor C3074. • Measure the voltage between passenger seat front height motor C3074-1, circuit CPS35 (VT/GN), harness side and C3074-2, circuit CPS34 (GY/BU), while pushing the seat control switch front height adjust up and down.  N0052984 • **Is the voltage greater than +10 volts when the front height adjust is pressed down, greater than -10 volts when the**	**Yes** INSTALL a new passenger seat track assembly. REFER to Seat Track — Power in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS.

front height adjust is pressed up and 0 volt when the switch is in the rest position?	REFER to Section 501-20B . **No** GO to J11 .
J11 CHECK CIRCUIT CPS35 (VT/GN) FOR AN OPEN • Disconnect: Passenger Seat Control Switch C3026. • Measure the resistance between passenger seat control switch C3026-6, circuit CPS35 (VT/GN), harness side and passenger seat front height motor C3074-1, circuit CPS35 (VT/GN), harness side.  N0055033 • **Is the resistance less than 5 ohms?**	**Yes** GO to J12 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
J12 CHECK CIRCUIT CPS34 (GY/BU) FOR AN OPEN • Measure the resistance between passenger seat control switch C3026-2, circuit CPS34 (GY/BU) harness side, and passenger seat front height motor C3074-2, circuit CPS34 (GY/BU), harness side.  N0055034 • **Is the resistance less than 5 ohms ?**	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050.

	CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
J13 CHECK VOLTAGE TO THE PASSENGER SEAT RECLINER MOTOR	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the passenger seat safety belt buckle pretensioner C3050. • Disconnect the passenger seat side air bag C3052. • Disconnect: Passenger Seat Recliner Motor C3189. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between passenger seat recliner motor C3189-1, circuit CPS08 (VT/OG), harness side and C3189-2, circuit CPS07 (GY/BN), while pushing the recline switch forward and rearward.  N0010826 • **Is the voltage greater than -10 volts when the switch is pushed forward, greater than +10 volts when the switch is pushed rearward and 0 volt when the switch is in a rest position?**	**Yes** INSTALL a new passenger seat recliner motor. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to J14 .
J14 CHECK CIRCUITS CPS39 (GY/YE) AND CPS07 (GY/BN) FOR AN OPEN	
• Disconnect: Passenger Seat Control Switch C3026. • Measure the resistance between passenger seat control switch C3026-11, circuit CPS39 (GY/YE), harness side and passenger seat recliner motor C3189-2, circuit CPS07 (GY/BN), harness side.  N0055035 • **Is the resistance less than 5 ohms?**	**Yes** GO to J15 . **No** REPAIR the affected circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.

	REPOWER the SRS. REFER to Section 501-20B .
J15 CHECK CIRCUITS CPS40 (VT/GY) AND CPS08 (VT/OG) FOR AN OPEN	
• Measure the resistance between passenger seat control switch C3026-8, circuit CPS40 (VT/GY) harness side, and passenger seat recliner motor C3189-1, circuit CPS08 (VT/OG), harness side.  N0055036 • **Is the resistance less than 5 ohms ?**	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test K: The Power Seat Does Not Move Horizontally/Vertically — Passenger

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

The passenger seat control switch is powered by battery voltage on circuit SBB29 (GY/RD) and is supplied ground on circuit GD138 (BK/WH). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new motor needs to be installed, it is necessary to install an entire power seat track.

Possible Causes

A passenger power seat that does not move horizontally and/or vertically can be caused by:

- wiring, terminals or connectors.
- a faulty seat control switch.
- a faulty seat track motor (seat track).

PINPOINT TEST K: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY — PASSENGER

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
K1 CHECK HORIZONTAL DIRECTION MOTOR FOR CORRECT OPERATION	
• Operate the passenger power seat forward and rearward. • **Will the seat move horizontally?**	**Yes** GO to K5 . **No** GO to K2 .
K2 CHECK VOLTAGE TO THE PASSENGER SEAT HORIZONTAL MOTOR	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the passenger seat safety belt buckle pretensioner C3050. • Disconnect the passenger seat side air bag C3052. • Disconnect: Passenger Seat Horizontal Motor C332. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between passenger seat horizontal motor C332-1, circuit CPS38 (GN/BU), harness side and C332-2, circuit CPS33 (WH), harness side, while pushing the passenger seat control switch forward and rearward.  N0052984 • **Is the voltage greater than -10 volts when the switch is pushed forward, greater than +10 volts when the switch is**	**Yes** INSTALL a new passenger seat track assembly. REFER to Seat Track — Power in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to K3 .

pushed rearward and 0 volt when the switch is in a rest position?	
K3 CHECK CIRCUIT CPS38 (GN/BU) FOR AN OPEN	
• Disconnect: Passenger Seat Control Switch C355. • Measure the resistance between passenger seat control switch C355-6, circuit CPS38 (GN/BU), harness side and passenger seat horizontal motor C332-1, circuit CPS38 (GN/BU), harness side.  N0055037 • **Is the resistance less than 5 ohms ?**	**Yes** GO to K4 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
K4 CHECK CIRCUIT CPS33 (WH) FOR AN OPEN	
• Measure the resistance between passenger seat control switch C355-3, circuit CPS33 (WH), harness side and passenger seat horizontal motor C332-2, circuit CPS33 (WH), harness side.  N0055038 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new passenger seat control switch. Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.

	REPOWER the SRS. REFER to Section 501-20B .
K5 DETERMINE THE SEAT HEIGHT ADJUST FAILURE	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the passenger seat safety belt buckle pretensioner C3050. • Disconnect the passenger seat side air bag C3052. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Determine the seat height adjust failure. • **Does the seat front or rear height adjust up and down?**	**Yes** If only front height adjust operates, GO to K6 . If only rear height adjust operates, GO to K9 . **No** INSTALL a new passenger seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
K6 CHECK VOLTAGE TO THE PASSENGER SEAT REAR HEIGHT MOTOR	
• Disconnect: Passenger Seat Rear Height Motor C3075. • Measure the voltage between passenger seat rear height motor C3075-1, circuit CPS37 (WH/BU), harness side and C3075-2, circuit CPS36 (YE/GY), harness side, while depressing the seat control switch rear height adjust up and down.  N0052984 • **Is the voltage greater than -10 volts when the rear height adjust is pressed down, greater than +10 volts when the rear height adjust is pressed up and 0 volt when the switch is in the rest position?**	**Yes** INSTALL a new passenger seat track assembly. REFER to Seat Track — Power in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to K7 .
K7 CHECK CIRCUIT CPS36 (YE/GY) FOR AN OPEN	

• Disconnect: Passenger Seat Control Switch C355. • Measure the resistance between passenger seat control switch C355-5, circuit CPS36 (YE/GY), harness side and passenger seat rear height motor C3075-2, circuit CPS36 (YE/GY), harness side.  N0055040 • **Is the resistance less than 5 ohms ?**	**Yes** GO to K8 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
K8 CHECK CIRCUIT CPS37 (WH/BU) FOR AN OPEN	
• Measure the resistance between passenger seat control switch C355-7, circuit CPS37 (WH/BU), harness side and passenger seat rear height motor C3075-1, circuit CPS37 (WH/BU), harness side.  N0055041 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

K9 CHECK VOLTAGE TO THE PASSENGER SEAT FRONT HEIGHT MOTOR	
• Disconnect: Passenger Seat Front Height Motor C3074. • Measure the voltage between passenger seat front height motor C3074-1, circuit CPS35 (VT/GN), harness side and C3074-2, circuit CPS34 (GY/BU), while pushing the seat control switch rear height adjust up and down.  N0052984 • **Is the voltage greater than +10 volts when the front height adjust is pressed down, greater than -10 volts when the front height adjust is pressed up and 0 volt when the switch is in the rest position?**	**Yes** INSTALL a new passenger seat track assembly. REFER to Seat Track — Power in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to K10 .
K10 CHECK CIRCUIT CPS35 (VT/GN) FOR AN OPEN	
• Disconnect: Passenger Seat Control Switch C355. • Measure the resistance between passenger seat control switch C355-8, circuit CPS35 (VT/GN), harness side and passenger seat front height motor C3074-1, circuit CPS35 (VT/GN), harness side.  N0055042 • **Is the resistance less than 5 ohms?**	**Yes** GO to K11 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
K11 CHECK CIRCUIT CPS34 (GY/BU) FOR AN OPEN	
• Measure the resistance between passenger seat control switch C355-1, circuit CPS34 (GY/BU) harness side, and passenger seat front height motor C3074-2, circuit CPS34 (GY/BU), harness side.	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner

 N0055043 • **Is the resistance less than 5 ohms?**	C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test L: The Memory Seat is Inoperative/Does Not Operate Correctly — Does Not Operate Horizontally/Vertically/Recline

Refer to Wiring Diagrams Cell 123 , Memory Seats for schematic and connector information.

Refer to Wiring Diagrams Cell 149 , Component Testing for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBP12 (GN/RD) and is supplied ground on circuit GD133 (BK). When pressed, the seat control switch supplies the voltage and ground to the applicable driver seat module (DSM) inputs. The DSM then supplies voltage and ground to the appropriate power seat track motor or power recline motor based on the inputs received from the seat control switch. When pressed in the opposite direction, the seat control switch reverses the polarity to the DSM inputs, and the DSM likewise reverses polarity of the appropriate power seat track motor or power recliner motor circuits causing the seat or backrest to move in the opposite direction. There are 3 power seat track motors that combine to move the seat horizontally (forward/rearward) and vertically (front up/down and rear up/down). The seat backrest power recliner mechanism uses a single motor to move the seat backrest forward and rearward.

Battery voltage is also supplied to DSM on circuit SBP02 (YE/RD) and SBB45 (GY/RD). Ground is supplied to the DSM on circuits GD133 (BK) and GD143 (BK/VT).

Each motor, in the memory power seat track and power recliner mechanism contains a Hall-effect position sensor. The DSM supplies a shared signal feed circuit to each position sensor. Each position sensor sends a signal pulse back to the DSM used to monitor the position of the power seat and seat backrest. The DSM uses this information to return the seat to a stored pre-programmed position when pressing the memory set switch or a remote entry transmitter. Refer to Principles of Operation in this section or the Owner's Literature for additional information on programming the DSM for storing memory seat positions.

The following pinpoint test diagnoses a memory seat that does not operate in one or more directions when using the seat control switch. If the memory seat moves in all directions using the seat control switch, Go To Pinpoint Test M .

Possible Causes

An inoperative memory seat can be caused by:

- a fuse.
- wiring, terminals or connectors.
- a faulty seat control switch.
- missing status information (CAN communication bus messages):
  - ignition switch status.
  - gear selector position.
- a faulty power seat track.
- a faulty power recliner motor.
- a faulty DSM.

PINPOINT TEST L: THE MEMORY SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY — DOES NOT OPERATE HORIZONTALLY/VERTICALLY/RECLINE

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

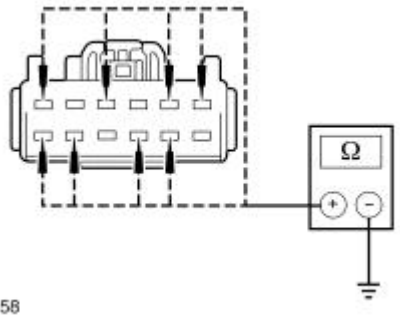
NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

Test Step	Result / Action to Take
L1 CHECK IGNITION SWITCH STATUS, TRANSMISSION GEAR SELECTOR STATUS AND RETRIEVE THE DSM DTCs	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Datalogger/Transmission Control Module (TCM) PID: Transmission Range (PRNDL). • Operate the transmission gear selector in all positions while monitoring the PID. • Enter the following diagnostic mode on the diagnostic tool: Datalogger/Smart Power Distribution Junction Box (SPDJB) PIDs: Ignition Switch Status. • Cycle the ignition switch in all positions while monitoring the PID. • Verify the PID values agree with the ignition switch and transmission gear selector in all positions before proceeding with memory seat diagnosis. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Driver Seat Module (DSM) Self Test/Retrieve DTCs. • **Are any DSM DTCs retrieved?**	**Yes** If DTCs B1663, B1664, B1665 and B1666 are all retrieved, GO to L10 . If DTC B1663, GO to L20 . If DTC B1664, GO to L23 . If DTC B1665, GO to L26 . If DTC B1666, GO to L29 . If DTC B1703, GO to L3 . If DTC B1707, GO to L3 . If DTC B1711, GO to L3 . If DTC B1715, GO to L3 .

	If DTC B1719, GO to L3. If DTC B1723, GO to L3. If DTC B1727, GO to L3. If DTC B1731, GO to L3. If DTC B1342, INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10. REPEAT the self-test. CLEAR the DTCs. For any other DSM DTCs, REFER to the Driver Seat Module (DSM) Diagnostic Trouble Code (DTC) Chart. **No** To diagnose an ignition switch status concern, REFER to Section 211-05. To diagnose a transmission gear selector (PRNDL) status concern, REFER to Section 307-01A or Section 307-01B. Otherwise, GO to L2.
L2 MONITOR THE DSM PIDs AND CHECK FOR CORRECT MEMORY SEAT SWITCH INPUTS • Enter the following diagnostic mode on the diagnostic tool: Datalogger/DSM PIDs: Driver Seat/Pedal/Tilt Steering Column Input Switch Status. • Operate the seat control switch in all positions while monitoring the DSM driver seat switch input status PIDs. • **Do the PID values agree with the switch positions?**	**Yes** GO to L9. **No** VERIFY smart power distribution junction box (SPDJB) fuse 12 (7.5A) is OK. If the fuse fails while operating the seat control switch, DISCONNECT the seat control switch C3016 and GO to L7. If the fuse is OK, GO to L3.
L3 CHECK THE SEAT CONTROL SWITCH • Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B. • Disconnect the driver seat safety belt buckle pretensioner C3049.	**Yes** GO to L4. **No** INSTALL a new seat control switch. REFER to

• Disconnect the driver seat side air bag C3051. • Disconnect: Seat Control Switch C3016. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Check the seat control switch. Refer to Wiring Diagrams Cell 149 , Component Testing for schematic and connector information. • **Is the seat control switch OK?**	Seat Control Switch — Front in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
L4 CHECK CIRCUIT SBP12 (GN/RD) FOR VOLTAGE TO THE SEAT CONTROL SWITCH	
• Measure the voltage between seat control switch C3016-5, circuit SBP12 (GN/RD), harness side and ground.  N0010816 • **Is the voltage greater than 10 volts?**	**Yes** GO to L5 . **No** VERIFY smart power distribution junction box (SPDJB) fuse 12 (7.5A) is OK. If OK, REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
L5 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Measure the resistance between seat control switch C3016-3, circuit GD133 (BK), harness side and ground.  N0010815 • **Is the resistance less than 5 ohms?**	**Yes** GO to L6 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS.

	REFER to Section 501-20B .
L6 CHECK SEAT CONTROL SWITCH TO DRIVER SEAT MODULE CIRCUITS FOR A SHORT TO POWER • Disconnect: DSM C341c and C341d. • Key in ON position. • Measure the voltage between the following seat control switch C3016 pins, harness side and ground. **Connector** / **Circuit** C3016-9 — CPS28 (GN) C3016-4 — CPS23 (GN/VT) C3016-2 — CPS25 (WH/VT) C3016-6 — CPS24 (GY) C3016-12 — CPS26 (YE/BU) C3016-1 — CPS27 (BU/BN) C3016-11 — CPS29 (WH/BN) C3016-8 — CPS30 (VT/BN)  N0013557 • **Is voltage indicated?**	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to L7 .
L7 CHECK SEAT CONTROL SWITCH TO DRIVER SEAT MODULE CIRCUITS FOR A SHORT TO GROUND • Key in OFF position. • Measure the resistance between the following seat control switch C3016 pins, harness side and ground. **Connector** / **Circuit** C3016-9 — CPS28 (GN) C3016-4 — CPS23 (GN/VT) C3016-2 — CPS25 (WH/VT) C3016-6 — CPS24 (GY) C3016-12 — CPS26 (YE/BU) C3016-1 — CPS27 (BU/BN) C3016-11 — CPS29 (WH/BN) C3016-8 — CPS30 (VT/BN)	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to L8 .



- **Are the resistances greater than 10,000 ohms?**

L8 CHECK SEAT CONTROL SWITCH TO DRIVER SEAT MODULE CIRCUITS FOR AN OPEN

- Measure the resistance between the following seat control switch C3016 pins, harness side and DSM C341c/C341d pins, harness side.

Seat Control Switch Connector	Circuit	DSM Connector
C3016-9	CPS28 (GN)	C341c-3
C3016-4	CPS23 (GN/VT)	C341c-4
C3016-2	CPS25 (WH/VT)	C341c-14
C3016-6	CPS24 (GY)	C341c-13
C3016-12	CPS26 (YE/BU)	C341c-15
C3016-1	CPS27 (BU/BN)	C341c-16
C3016-11	CPS29 (WH/BN)	C341c-19
C3016-8	CPS30 (VT/BN)	C341d-4

- **Are the resistances less than 5 ohms?**

Yes
INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10 .
REPEAT the self-test.
CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B .

No
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B .

L9 CHECK THE DSM FOR CORRECT OUTPUTS USING A SCAN TOOL AND DSM ACTIVE COMMANDS

- Enter the following diagnostic mode on the diagnostic tool: Datalogger/DSM: Driver's Seat Output Control.
- Toggle the following DSM active commands ON and OFF while monitoring the seat movement:
  - Front Motor Up
  - Front Motor Down
  - Rear Motor Up

Yes
INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10 .
REPEAT the self-test.
CLEAR the DTCs.

DISCONNECT the battery

■ Rear Motor Down ■ Horizontal Motor Forward ■ Horizontal Motor Backward ■ Recline Motor Forward ■ Recline Motor Backward • **Does the driver seat operate correctly using the active commands?**	ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** If no seat movement, GO to L10 . If no front vertical seat movement, GO to L20 . If no rear vertical seat movement, GO to L23 . If no horizontal seat movement, GO to L26 . If no recline seat movement, GO to L29 .
L10 CHECK DSM CIRCUIT SBB45 (GY/RD) FOR VOLTAGE	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • Disconnect: DSM C341a. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between DSM C341a-1, circuit SBB45 (GY/RD), harness side and ground; and between DSM C341c-1, circuit SBP02 (YE/RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to L11 . **No** VERIFY battery junction box (BJB) fuse 45 (30A) or smart power distribution junction box (SPDJB) fuse 2 (15A) is OK. If OK, REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
L11 CHECK CIRCUITS GD133 (BK) AND GD143 (BK/VT) FOR AN OPEN	
• Disconnect: DSM C341e. • Measure the resistance between DSM C341a-2, circuit GD143 (BK/VT), harness side and ground; and between DSM C341e-	**Yes** GO to L12 .

20, circuit GD133 (BK), harness side and ground.  N0053694 • **Is the resistance less than 5 ohms?**	**No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
L12 CHECK CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR A SHORT TO GROUND	
• Disconnect: DSM C341b. • Measure the resistance between DSM C341b-8, circuit CPS03 (VT/GY), harness side and ground; and between DSM C341b-16, circuit CPS02 (GY/YE), harness side and ground.  N0053695 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to L14 . **No** GO to L13 .
L13 CHECK POWER SEAT FRONT HEIGHT MOTOR CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR A SHORT TO GROUND	
• Disconnect: Power Seat Front Height Motor C382. • Measure the resistance between DSM C341b-8, circuit CPS03 (VT/GY), harness side and ground; and between DSM C341b-16, circuit CPS02 (GY/YE), harness side and ground.  N0053695 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-

	test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
L14 CHECK CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR A SHORT TO GROUND • Measure the resistance between DSM C341b-4, circuit CPS05 (BU/WH), harness side and ground; and between DSM C341b-12, circuit CPS04 (YE/OG), harness side and ground.  N0053696 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to L16 . **No** GO to L15 .
L15 CHECK THE POWER SEAT REAR HEIGHT MOTOR CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR A SHORT TO GROUND • Disconnect: Power Seat Rear Height Motor C363. • Measure the resistance between DSM C341b-4, circuit CPS05 (BU/WH), harness side and ground; and between DSM C341b-12, circuit CPS04 (YE/OG), harness side and ground.  N0053696 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery

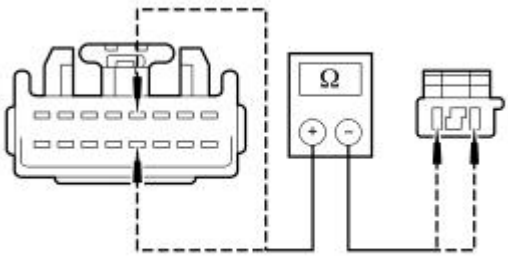
	ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
L16 CHECK CIRCUITS CPS06 (GN/WH) AND CPS01 (GN/BU) FOR A SHORT TO GROUND • Measure the resistance between DSM C341b-15, circuit CPS06 (GN/WH), harness side and ground; and between DSM C341b-7, circuit CPS01 (GN/BU), harness side and ground.  N0053733 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to L18 . **No** GO to L17 .
L17 CHECK THE POWER SEAT HORIZONTAL MOTOR CIRCUITS CPS06 (GN/WH) AND CPS01 (GN/BU) FOR A SHORT TO GROUND • Disconnect: Power Seat Horizontal Motor C362. • Measure the resistance between DSM C341b-15, circuit CPS06 (GN/WH), harness side and ground; and between DSM C341b-7, circuit CPS01 (GN/BU), harness side and ground.  N0053733 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049.

	CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
L18 CHECK CIRCUITS CPS07 (GY/BN) AND CPS08 (VT/OG) FOR A SHORT TO GROUND • Measure the resistance between DSM C341b-2, circuit CPS07 (GY/BN), harness side and ground; and between DSM C341b-10, circuit CPS08 (VT/OG), harness side and ground.  N0053734 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to L19 .
L19 CHECK THE DRIVER POWER SEAT RECLINER MOTOR CIRCUITS CPS07 (GY/BN) AND CPS08 (VT/OG) FOR A SHORT TO GROUND • Disconnect: Driver Power Seat Recliner Motor C3187. • Measure the resistance between DSM 341b-2, circuit CPS07 (GY/BN), harness side and ground; and between DSM C341b-10, circuit CPS08 (VT/OG), harness side and ground.  N0053734 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new driver seat recliner motor. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT

	driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
L20 CHECK THE POWER SEAT FRONT HEIGHT MOTOR FOR CORRECT OPERATION	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • Disconnect: Power Seat Front Height Motor C382. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Datalogger/DSM: Driver Seat Output Control. • Measure the voltage between power seat front height motor C382-1, circuit CPS03 (VT/GY) and C382-2, circuit CPS02 (GY/YE), harness side while using the scan tool to operate DSM active commands front motor up and front motor down, ON and OFF.  N0052984 • **Is voltage present when the motor is commanded ON and no voltage present when commanded OFF?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to L21 .
L21 CHECK CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR A SHORT TO POWER	
• Key in OFF position. • Disconnect: DSM C341b. • Key in ON position. • Measure the voltage between DSM C341b-8, circuit CPS03 (VT/GY), harness side and ground; and between DSM C341b-16, circuit CPS02 (GY/YE), harness side and ground.	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051.

 N0053735 • **Is voltage indicated?**	REPOWER the SRS. REFER to Section 501-20B . **No** GO to L22 .
L22 CHECK CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between DSM C341b-8, circuit CPS03 (VT/GY), harness side and power seat motor C382-1, circuit CPS03 (VT/GY), harness side; and between DSM C341b-16, circuit CPS02 (GY/YE), harness side and power seat motor C382-2, circuit CPS02 (GY/YE), harness side.  N0053736 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
L23 CHECK THE REAR HEIGHT MOTOR FOR CORRECT OPERATION	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051.	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. REPEAT the self-test. CLEAR the DTCs.

• Disconnect: Power Seat Rear Height Motor C363. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Datalogger/DSM: Driver Seat Output Control. • Measure the voltage between power seat rear height motor C363-1, circuit CPS05 (BU/WH), harness side and C363-2, circuit CPS04 (YE/OG), harness side while using the scan tool to operate DSM active commands rear motor up and rear motor down, ON and OFF.  N0052984 • **Is voltage present when the motor is commanded ON and no voltage present when commanded OFF?**	DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to L24 .
L24 CHECK CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR A SHORT TO POWER	
• Key in OFF position. • Disconnect: DSM C341b. • Key in ON position. • Measure the voltage between DSM C341b-4, circuit CPS05 (BU/WH), harness side and ground; and between DSM C341b-12, circuit CPS04 (YE/OG), harness side and ground.  N0053737 • **Is voltage indicated?**	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to L25 .
L25 CHECK CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between DSM C341b-4, circuit CPS05 (BU/WH), harness side and power seat motor C363-1, circuit CPS05 (BU/WH), harness side; and between DSM C341b-12, circuit CPS04 (YE/OG), harness side and rear height power seat motor C363-2, circuit CPS04 (YE/OG), harness side.	**Yes** INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle



N0053738

- **Are the resistances less than 5 ohms?**

pretensioner C3049.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B .

No
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

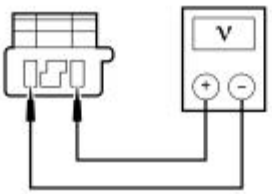
DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B .

L26 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
- Disconnect the driver seat safety belt buckle pretensioner C3049.
- Disconnect the driver seat side air bag C3051.
- Disconnect: Power Seat Horizontal Motor C362.
- **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.**
- Connect the battery ground cable.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Datalogger/DSM: Driver Seat Output Control.
- Measure the voltage between power seat motor C362-2, circuit CPS01 (GN/BU) and C362-1, circuit CPS06 (GN/WH), harness side while using the scan tool to operate DSM active commands horizontal motor forward and horizontal motor backward, ON and OFF.



N0052984

- **Is voltage present when the motor is commanded ON and**

Yes
INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B .

No
GO to L27 .

no voltage present when commanded OFF?	
L27 CHECK CIRCUITS CPS01 (GN/BU) AND CPS06 (GN/WH) FOR A SHORT TO POWER	
• Key in OFF position. • Disconnect: DSM C341b. • Key in ON position. • Measure the voltage between DSM C341b-15, circuit CPS06 (GN/WH), harness side and ground; and between DSM C341b-7, circuit CPS01 (GN/BU), harness side and ground.  N0053739 • **Is voltage indicated?**	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to L28 .
L28 CHECK CIRCUITS CPS01 (GN/BU) AND CPS06 (GN/WH) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between DSM C341b-15, circuit CPS06 (GN/WH), harness side and power seat motor C362-1, circuit CPS06 (GN/WH), harness side; and between DSM C341b-7, circuit CPS01 (GN/BU), harness side and horizontal power seat motor C362-2, circuit CPS01 (GN/BU), harness side.  N0053740 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-

	20B .
L29 CHECK THE DRIVER SEAT POWER RECLINER MOTOR FOR CORRECT OPERATION	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • Disconnect: Driver Seat Power Recliner Motor C3187. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Datalogger/DSM: Driver Seat Output Control. • Measure the voltage between driver seat power recliner motor C3187-2, circuit CPS07 (GY/BN) and C3187-1, circuit CPS08 (VT/OG), harness side while using the scan tool to operate the DSM active commands recline motor forward and recline motor backward, ON and OFF.  N0010826 • **Is voltage present when the motor is commanded ON and no voltage present when commanded OFF?**	**Yes** INSTALL a new driver seat recliner motor. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to L30 .
L30 CHECK CIRCUITS CPS07 (GY/BN) AND CPS08 (VT/OG) FOR A SHORT TO POWER	
• Key in OFF position. • Disconnect: DSM C341b. • Key in ON position. • Measure the voltage between DSM C341b-2, circuit CPS07 (GY/BN), harness side and ground; and between DSM C341b-10, circuit CPS08 (VT/OG), harness side and ground.  N0053741 • **Is voltage indicated?**	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to L31 .
L31 CHECK CIRCUITS CPS07 (GY/BN) AND CPS08 (VT/OG) FOR	

AN OPEN	
• Key in OFF position. • Measure the resistance between DSM C341b-2, circuit CPS07 (GY/BN), harness side and power seat recliner motor C3187-2, circuit CPS07 (GY/BN), harness side; and between DSM C341b-10, circuit CPS08 (VT/OG), harness side and power seat recliner motor C3187-1, circuit CPS08 (VT/OG), harness side.  N0053742 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test M: The Memory Seat Does Not Operate Correctly — Does Not Operate Using the Memory Set Switch

Refer to Wiring Diagrams Cell 123 , Memory Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBP12 (GN/RD) and is supplied ground on circuit GD133 (BK). When pressed, the seat control switch supplies the voltage and ground to the applicable driver seat module (DSM) inputs. The DSM then supplies voltage and ground to the appropriate power seat track motor or power recline motor based on the inputs received from the seat control switch. When pressed in the opposite direction, the seat control switch reverses the polarity to the DSM inputs, and the DSM likewise reverses polarity of the appropriate power seat track motor or power recliner motor circuits causing the seat or backrest to move in the opposite direction. There are 3 power seat track motors that combine to move the seat horizontally (forward/rearward) and vertically (front up/down and rear up/down). The seat backrest power recliner mechanism uses a single motor to move the seat backrest forward and rearward.

Battery voltage is also supplied to DSM on circuit SBP02 (YE/RD) and SBB45 (GY/RD). Ground is supplied to the DSM on circuits GD133 (BK) and GD143 (BK/VT).

Each motor, in the memory power seat track and power recliner mechanism contains a Hall-effect position sensor. The DSM supplies a shared signal feed circuit to each position sensor. Each position sensor sends a signal pulse back to the DSM used to monitor the position of the power seat and seat backrest. The DSM uses this information to return the seat to a stored pre-programmed position when pressing the memory set switch or a remote entry transmitter. Refer to Principles of Operation in this section or the Owner's Literature for additional information on programming the DSM for storing memory seat positions.

The following pinpoint test diagnoses a memory seat that does not operate correctly using the memory set switch. If the memory seat does not move in all directions using the seat control switch, Go To Pinpoint Test L .

Possible Causes

A memory seat that does not operate correctly can be caused by:

- wiring, terminals or connectors.
- a faulty memory set switch.
- missing status information (CAN communication bus messages):
  - ignition switch status.
  - gear selector position.
- a faulty remote entry transmitter.
- a faulty memory power seat track.
- a faulty recliner mechanism.
- a faulty DSM.

PINPOINT TEST M: THE MEMORY SEAT DOES NOT OPERATE CORRECTLY — DOES NOT OPERATE USING THE MEMORY SET SWITCH

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

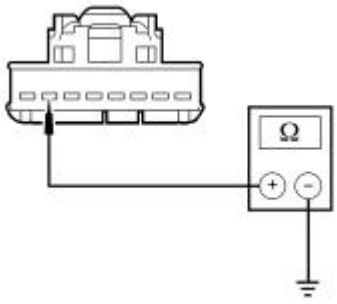
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

Test Step	Result / Action to Take
M1 CHECK IGNITION SWITCH STATUS, TRANSMISSION GEAR SELECTOR STATUS AND RETRIEVE THE DSM DTCs	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Datalogger/Transmission Control Module (TCM) PID: PRND Position. • Operate the transmission gear selector in all positions while monitoring the PID. • Enter the following diagnostic mode on the diagnostic tool: Datalogger/Smart Power Distribution Junction Box (SPDJB) PID: Ignition Switch Status. • Cycle the ignition switch in all positions while monitoring the PID. • Verify the PID values agree with the ignition switch and transmission gear selector in all positions before proceeding with memory seat diagnosis. • Key in ON position. • Using the switches, operate the memory seat, memory mirrors,	**Yes** If DTC B2084 and B208A, GO to M5 . If DTCs B1952, B1956, B1960 and B1964 are all retrieved, GO to M8 . If DTCs B1953, B1957, B1961 and B1965 are all retrieved, GO to M8 . If DTC B1530, GO to M3 . If DTC B1534, GO to

adjustable memory pedals (if equipped) and adjustable memory steering column (if equipped) in all directions through the full range of travel. ● Place the memory seat, memory mirrors, adjustable memory pedals (if equipped) and adjustable memory steering column (if equipped) in central travel positions. ● Enter the following diagnostic mode on the diagnostic tool: Driver Seat Module (DSM) Self Test/Retrieve DTCs. ● **Are any DSM DTCs retrieved?**	M3 . If DTC B1538, GO to M3 . If DTC B1663, GO to M9 . If DTC B1664, GO to M12 . If DTC B1665, GO to M15 . If DTC B1666, GO to M18 . If DTC B1952, GO to M12 . If DTC B1953, GO to M12 . If DTC B1956, GO to M9 . If DTC B1957, GO to M9 . If DTC B1960, GO to M18 . If DTC B1961, GO to M18 . If DTC B1964, GO to M15 . If DTC B1965, GO to M15 . If DTC B2300, GO to M8 . If DTC B1342, INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. For any other DSM DTCs, REFER to the Driver Seat Module (DSM) Diagnostic Trouble Code (DTC) Chart. **No** To diagnose an ignition switch status concern, REFER to Section 211-05 .

	To diagnose a transmission gear selector (PRNDL) status concern, REFER to Section 307-01A or Section 307-01B . Otherwise, GO to M2 .
M2 MONITOR THE DSM PIDs AND CHECK THE DSM FOR CORRECT MEMORY SET SWITCH INPUTS	
• Enter the following diagnostic mode on the diagnostic tool: Datalogger/DSM PID: Memory Set/Recall Input Switch Status. • Monitor the DSM memory set switch, memory set/recall 1 switch and memory set/recall 2 switch PID while activating the memory set switch, recall 1 and recall 2 buttons. • **Do the PID values agree with the switch button positions?**	**Yes** GO to M8 . **No** GO to M3 .
M3 CHECK THE MEMORY SET SWITCH	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Memory Set Switch C3246. • Using the following table to check the memory set switch, measure the resistance between the memory set switch pins, component side, while pressing the indicated switch buttons and compare the results to the table. **Switch Button / Pins / Ohms** Memory Switch 1 / 2 and 7 / Less than 5 Memory Switch 2 / 2 and 3 / Less than 5 Memory Set Switch / 2 and 4 / Less than 5  N0054920 • **Is the resistance less than 5 ohms with the switch buttons depressed and greater than 10,000 ohms with the switch buttons released?**	**Yes** GO to M4 . **No** INSTALL a new memory set switch. REFER to Memory Set Switch . REPOWER the SRS. REFER to Section 501-20B . REPEAT the self-test. CLEAR the DTCs.
M4 CHECK GROUND CIRCUIT GD133 (BK) TO THE MEMORY SET SWITCH	
• Key in ON position. • Measure the resistance between memory set switch C3246-2, circuit GD133 (BK), harness side and ground.	**Yes** GO to M5 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.



N0040379

- **Is the resistance less than 5 ohms?**

DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049.

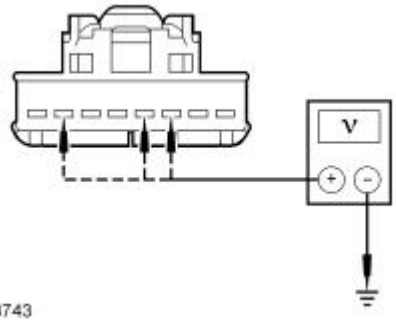
CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B .

M5 CHECK CIRCUITS CPS14 (GY/VT), CPS15 (VT/WH) AND CPS16 (YE) FOR A SHORT TO POWER

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
- Disconnect the driver seat safety belt buckle pretensioner C3049.
- Disconnect the driver seat side air bag C3051.
- Disconnect: DSM C341c and C341d.
- **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.**
- Connect the battery ground cable.
- Key in ON position.
- Measure the voltage between the following memory set switch C3246 pins, harness side and ground:

Connector - Pin	Circuit
C3246-4	CPS14 (GY/VT)
C3246-7	CPS15 (VT/WH)
C3246-3	CPS16 (YE)



N0053743

- **Is voltage indicated?**

Yes
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B .

No
GO to M6 .

M6 CHECK CIRCUITS CPS14 (GY/VT), CPS15 (VT/WH) AND CPS16 (YE) FOR A SHORT TO GROUND

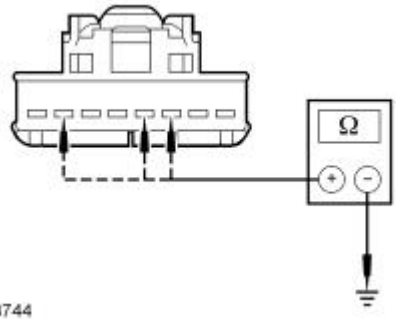
- Key in OFF position.
- Measure the resistance between the following memory set switch C3246 pins, harness side and ground:

Connector - Pin	Circuit

Yes
GO to M7 .

No
REPAIR the affected circuit. REPEAT the self-

C3246-4	CPS14 (GY/VT)
C3246-7	CPS15 (VT/WH)
C3246-3	CPS16 (YE)



- **Are the resistances greater than 10,000 ohms?**

test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B .

M7 CHECK CIRCUITS CPS14 (GY/VT), CPS15 (VT/WH) AND CPS16 (YE) FOR AN OPEN

- Measure the resistance between the following memory set switch C3246 pins and DSM C341c/C341d pins:

Memory Set Switch	Circuit	DSM
C3246-3	CPS16 (YE)	C341c-11
C3246-4	CPS14 (GY/VT)	C341d-19
C3246-7	CPS15 (VT/WH)	C341d-9

- **Are the resistances less than 5 ohms?**

Yes
INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B .

No
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B .

M8 MONITOR THE DSM PIDs

• Enter the following diagnostic mode on the diagnostic tool: Datalogger/DSM PIDs:.
  ▪ Driver Seat/Mirror/Pedal Sensor Output Status
  ▪ Steering Column Tilt Position (if equipped)
• Monitor the memory seat, memory mirrors, adjustable memory pedals (if equipped) and adjustable memory steering column (if equipped) sensor PIDs.
• Using the switches, operate the memory seat, memory mirrors, adjustable memory pedals (if equipped) and adjustable memory steering column (if equipped) in all directions through the full range of travel while monitoring the PIDs.
• **Does each PID indicate the sensor is operational throughout each associated motor's full range of travel?**
	Yes
	INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs.
	
	No
	If front up/down position sensor PID value indicates not present, GO to M9 .
	
	If rear up/down position sensor PID value indicates not present, GO to M12 .
	
	If forward/rearward position sensor PID value indicates not present, GO to M15 .
	
	If recline position sensor PID value indicates not present, GO to M18 .
	
	For a memory mirror sensor concern, REFER to Section 501-09 .
	
	For a memory adjustable pedal sensor concern, REFER to Section 206-00 .
	
	For an adjustable memory column sensor concern, REFER to Section 211-04 .

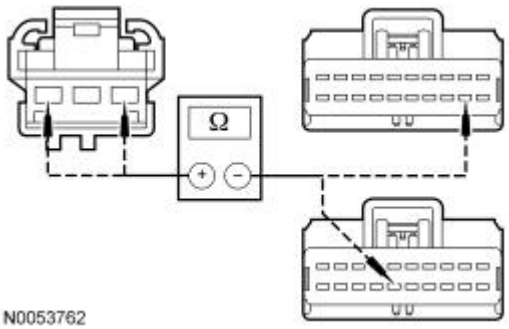
M9 CHECK SENSOR CIRCUITS VPS10 (BU/GN) AND RPS13 (GN/OG) FOR A SHORT TO POWER	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • Disconnect: DSM C341c and C341d. • Disconnect: Memory Seat Front Height Position Sensor C383. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Key in ON position. • Measure the voltage between memory seat front height position sensor C383-1, circuit VPS10 (BU/GN), harness side and ground; and between memory seat front height position sensor 383-3, circuit RPS13 (GN/OG), harness side and ground.	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No**

 N0053745 • **Is voltage indicated?**	GO to M10 .
M10 CHECK SENSOR CIRCUITS VPS10 (BU/GN) AND RPS13 (GN/OG) FOR A SHORT TO GROUND • Key in OFF position. • Measure the resistance between memory seat front height position sensor C383-1, circuit VPS10 (BU/GN), harness side and ground; and between memory seat front height position sensor 383-3, circuit RPS13 (GN/OG), harness side and ground.  N0053746 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to M11 . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
M11 CHECK SENSOR CIRCUITS VPS10 (BU/GN) AND RPS13 (GN/OG) FOR AN OPEN • Measure the resistance between memory seat front height position sensor C383-1, circuit VPS10 (BU/GN), harness side and DSM C341d-7, circuit VPS10 (BU/GN), harness side; and between memory seat front height position sensor 383-3, circuit RPS13 (GN/OG), harness side and DSM C341c-12, circuit RPS13 (GN/OG), harness side.  N0053760 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected

	circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
M12 CHECK SENSOR CIRCUITS VPS11 (GN/BN) AND RPS13 (GN/OG) FOR A SHORT TO POWER	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • Disconnect: DSM C341c and C341d. • Disconnect: Memory Seat Rear Height Position Sensor C373. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Key in ON position. • Measure the voltage between memory seat rear height position sensor C373-1, circuit VPS11 (GN/BN), harness side and ground; and between memory seat rear height position sensor C373-3, circuit RPS13 (GN/OG), harness side and ground.  N0053745 • **Is voltage indicated?**	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to M13 .
M13 CHECK SENSOR CIRCUITS VPS11 (GN/BN) AND RPS13 (GN/OG) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between memory seat rear height position sensor C373-1, circuit VPS11 (GN/BN), harness side and ground; and between memory seat rear height position sensor C373-3, circuit RPS13 (GN/OG), harness side and ground.	**Yes** GO to M14 . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety

 N0053746 • **Are the resistances greater than 10,000 ohms?**	belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
M14 CHECK SENSOR CIRCUITS VPS11 (GN/BN) AND RPS13 (GN/OG) AND FOR AN OPEN	
• Measure the resistance between memory seat rear height position sensor C373-1, circuit VPS11 (GN/BN), harness side and DSM C341d-17, circuit VPS11 (GN/BN), harness side; and between memory seat rear height position sensor C373-3, circuit RPS13 (GN/OG), harness side and DSM C341c-12, circuit RPS13 (GN/OG), harness side.  N0053761 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the circuit(s) in question. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
M15 CHECK SENSOR CIRCUITS VPS09 (BN/BU) AND RPS13 (GN/OG) AND FOR A SHORT TO POWER	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

portion of Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • Disconnect: DSM C341c and C341d. • Disconnect: Memory Seat Horizontal Position Sensor C372. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Key in ON position. • Measure the voltage between memory seat horizontal position sensor C373-1, circuit VPS09 (BN/BU), harness side and ground; and between memory seat horizontal position sensor C373-3, circuit RPS13 (GN/OG), harness side and ground.  N0053745 • **Is voltage indicated?**	DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to M16 .
M16 CHECK SENSOR CIRCUITS VPS09 (BN/BU) AND RPS13 (GN/OG) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between memory seat horizontal position sensor C373-1, circuit VPS09 (BN/BU), harness side and ground; and between memory seat horizontal position sensor C373-3, circuit RPS13 (GN/OG), harness side and ground.  N0053746 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to M17 . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
M17 CHECK SENSOR CIRCUITS VPS09 (BN/BU) AND RPS13 (GN/OG) FOR AN OPEN	
• Measure the resistance between memory seat horizontal position sensor C373-1, circuit VPS09 (BN/BU), harness side and DSM C341d-16, circuit VPS09 (BN/BU), harness side; and between memory seat horizontal position sensor C373-3, circuit RPS13 (GN/OG), harness side and DSM C341c-12, circuit RPS13 (GN/OG), harness side.	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track — Power in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the



- **Are the resistances less than 5 ohms?**

battery ground cable. CONNECT driver safety belt buckle pretensioner C3049.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B .

No
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

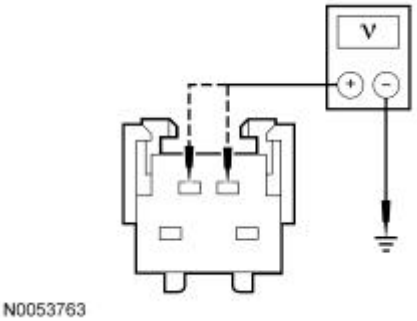
DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B .

M18 CHECK SENSOR CIRCUITS VPS12 (GY/OG) AND RPS13 (GN/OG) FOR A SHORT TO POWER

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
- Disconnect the driver seat safety belt buckle pretensioner C3049.
- Disconnect the driver seat side air bag C3051.
- Disconnect: DSM C341c and C341d.
- Disconnect: Driver Seat Recliner Motor C3187.
- **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.**
- Connect the battery ground cable.
- Key in ON position.
- Measure the voltage between driver seat recliner motor C3187-3, circuit VPS12 (GY/OG), harness side and ground; and between driver seat recliner motor C3187-4, circuit RPS13 (GN/OG), harness side and ground.



Yes
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049.

CONNECT driver seat side air bag module C3051.

REPOWER the SRS. REFER to Section 501-20B .

No
GO to M19 .

• **Is voltage indicated?**	
M19 CHECK SENSOR CIRCUITS VPS12 (GY/OG) AND RPS13 (GN/OG) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between driver seat recliner motor C3187-3, circuit VPS12 (GY/OG), harness side and ground; and between driver seat recliner motor C3187-4, circuit RPS13 (GN/OG), harness side and ground.  N0053764 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to M20 . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051.

	REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test N: Easy Exit/Easy Entry is Inoperative/Does Not Operate Correctly

Normal Operation

The DSM receives a key out command over the MS-CAN communication network and powers the driver seat rearward about 51 mm (2 in).

Possible Causes

An inoperative/not operating correctly easy entry/exit seat feature can be caused by:

- the easy entry/exit feature is not enabled.
- missing status information (CAN communication bus messages) to the driver seat module (DSM):
  - ignition switch status.
  - gear selector position.
- wiring, terminals or connectors.
- a faulty key-in-ignition warning switch.
- a faulty driver seat module (DSM).

PINPOINT TEST N: EASY EXIT/EASY ENTRY IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

NOTE: The transmission gear selector must be in park for the easy entry/exit feature to function.

Test Step	Result / Action to Take
N1 CHECK THE DRIVER POWER SEAT OPERATION	
• Key in ON position. • Check the message center to verify the easy entry/exit feature is enabled. • Using the seat control switch, operate the driver power seat fully forward and rearward. • Position the seat at least 2 inches from its rear stopping point. • Connect the diagnostic tool. • Enter the following diagnostic mode on the diagnostic tool: Driver Seat Module (DSM) Self Test/Retrieve DTCs. • **Are any DSM DTCs retrieved?**	**Yes** REFER to the Driver Seat Module (DSM) Diagnostic Trouble Code (DTC) Chart. **No** If disabled, ENABLE the easy entry/exit feature with the message center. REFER to the Owner's Literature — Driver Controls for easy entry/exit feature enable/disable instructions. TEST the system for normal operation. If OK, INSTRUCT the customer on correct system operation. If easy entry/exit is enabled and the seat does not move horizontally from the seat control switch, Go To Pinpoint Test L . Otherwise, GO to N2 .
N2 CHECK THE DRIVER SEAT MODULE (DSM) FOR CORRECT INPUTS	

• Enter the following diagnostic mode on the diagnostic tool: Datalogger/Transmission Control Module (TCM): Transmission Range (PRNDL) PID. • Monitor the PID while operating the transmission gear selector in all positions. • Enter the following diagnostic mode on the diagnostic tool: Datalogger/Smart Power Distribution Junction Box (SPDJB): Ignition Switch Position PIDs. • Monitor the PIDs with the key in the ignition switch and with the key removed. • **Do the PID values agree with the ignition switch and transmission gear selector positions?**	**Yes** INSTALL a new DSM and CARRY OUT PMI. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. **No** To diagnose the key-in-ignition warning switch fault, REFER to Section 413-09 . To diagnose a transmission gear selector (PRNDL) status concern, REFER to Section 307-01A or Section 307-01B .

Pinpoint Test O: The Power Lumbar is Inoperative — Driver

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Refer to Wiring Diagrams Cell 123 , Memory Seats for schematic and connector information.

Normal Operation

The seat control switch is powered by battery voltage on circuit SBB45 (GY/RD) or SBP12 (GN/RD) (memory seat) and is supplied ground on circuit GD143 (BK/VT) or GD133 (BK) (memory seat). When the lumbar knob on the seat control switch is pressed, voltage and ground are supplied to the power lumbar motor. When pressing the switch in the opposite direction, voltage polarity to the power lumbar motor is reversed, moving the lumbar assembly in the opposite direction.

Possible Causes

An inoperative power lumbar can be caused by:

- wiring, terminals or connectors.
- a faulty lumbar control switch.
- a faulty power lumbar motor assembly.

PINPOINT TEST O: THE POWER LUMBAR IS INOPERATIVE — DRIVER

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
O1 CHECK CIRCUIT SBB45 (GY/RD) OR SBP12 (GN/RD) (MEMORY SEAT) FOR AN OPEN	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of	**Yes** GO to O2 . **No**

Section 501-20B . • Disconnect the driver seat safety belt buckle pretensioner C3049. • Disconnect the driver seat side air bag C3051. • Disconnect: Seat Control Switch C3016. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between seat control switch C3016-5, circuit SBB45 (GY/RD) (SBP12 [GN/RD] for memory seat), harness side and ground.  N0010816 • **Is the voltage greater than 10 volts?**	VERIFY battery junction box (BJB) fuse 45 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
O2 CHECK CIRCUIT GD143 (BK/VT) OR GD133 (BK) (MEMORY SEAT) FOR AN OPEN • Measure the resistance between seat control switch C3016-3, circuit GD143 (BK/VT) (GD133 [BK] for memory seat), harness side and ground.  N0010815 • **Is the resistance less than 5 ohms?**	**Yes** GO to O3 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
O3 CHECK THE LUMBAR MOTOR • Connect: Seat Control Switch C3016. • Disconnect: Power Lumbar Motor C3215. • For power seat, measure the voltage between power lumbar motor C3215-B, circuit CPS18 (BN/GN), harness side and power lumbar motor C3215-A, circuit CPS19 (GY/VT), harness side.	**Yes** INSTALL a new power lumbar assembly. REFER to Lumbar Assembly in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle

 N0040627 • Operate the seat control switch in both directions. • **Is the voltage greater than 10 volts in both directions?**	pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No** GO to O4 .
O4 CHECK CIRCUIT CPS19 (GY/VT) AND CIRCUIT CPS18 (BN/GN) FOR A SHORT TO GROUND	
• Disconnect: Seat Control Switch C3016. • Measure the resistance between seat control switch C3016-7, circuit CPS18 (BN/GN), harness side and ground; and between seat control switch C3016-10, circuit CPS19 (GY/VT), harness side and ground.  N0040628 • **Are the resistances greater than 10,000 ohms.**	**Yes** GO to O5 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .
O5 CHECK CIRCUITS CPS19 (GY/VT) AND CPS18 (BN/GN) FOR AN OPEN	
• Measure the resistance between seat control switch C3016-7, circuit CPS18 (BN/GN), harness side and power lumbar motor C3215-B, circuit CPS18 (BN/GN), harness side; and between seat control switch C3016-10, circuit CPS19 (GY/VT), harness side and power lumbar motor C3215-A, circuit CPS19 (GY/VT), harness side.  N0040629 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B . **No**

	REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3049. CONNECT driver seat side air bag module C3051. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test P: The Power Lumbar is Inoperative — Passenger

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

The passenger seat control switch is powered by battery voltage on circuit SBB29 (GY/RD) and is supplied ground on circuit GD138 (BK/WH). When the lumbar knob on the seat control switch is pressed, voltage and ground are supplied to the power lumbar motor. When pressing the switch in the opposite direction, voltage polarity to the power lumbar motor is reversed, moving the lumbar assembly in the opposite direction.

Possible Causes

An inoperative power lumbar can be caused by:

- wiring, terminals or connectors.
- a faulty lumbar control switch.
- a faulty power lumbar motor assembly.

PINPOINT TEST P: THE POWER LUMBAR IS INOPERATIVE — PASSENGER

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
P1 CHECK CIRCUIT SBB29 (GY/RD) FOR AN OPEN	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect the passenger seat safety belt buckle pretensioner C3050. • If equipped, disconnect the passenger seat side air bag C3052.	**Yes** GO to P2 . **No** VERIFY battery junction box (BJB) fuse 29 (30A) is OK. If OK,

• Disconnect: Passenger Seat Control Switch C3026. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between passenger seat control switch C3026-5, circuit SBB29 (GY/RD), harness side and ground.  N0010816 • **Is the voltage greater than 10 volts?**	REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
P2 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Measure the resistance between passenger seat control switch C3026-3, circuit GD138 (BK/WH), harness side and ground.  N0010815 • **Is the resistance less than 5 ohms?**	**Yes** GO to P3 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
P3 CHECK THE LUMBAR MOTOR	
• Connect: Passenger Seat Control Switch C3026. • Disconnect: Power Lumbar Motor C3216. • For power seat, measure the voltage between power lumbar motor C3216-B, circuit CPS18 (BN/GN), harness side and power lumbar motor C3216-A, circuit CPS19 (GY/VT), harness side.  N0040627 • Operate the seat control switch in both directions.	**Yes** INSTALL a new power lumbar assembly. REFER to Lumbar Assembly in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.

• **Is the voltage greater than 10 volts in both directions?**	REPOWER the SRS. REFER to Section 501-20B . **No** GO to P4 .
P4 CHECK CIRCUIT CPS20 (VT) AND CIRCUIT CPS21 (WH/OG) FOR A SHORT TO GROUND	
• Disconnect: Passenger Seat Control Switch C3026. • Measure the resistance between seat control switch C3026-7, circuit CPS20 (VT), harness side and ground; and between seat control switch C3026-10, circuit CPS21 (WH/OG), harness side and ground.  N0040628 • **Are the resistances greater than 10,000 ohms.**	**Yes** GO to P5 . **No** REPAIR the affected circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
P5 CHECK CIRCUITS CPS18 (BN/GN), CPS19 (GY/VT), CPS20 (VT) AND CPS21 (WH/OG) FOR AN OPEN	
• Measure the resistance between seat control switch C3026-7, circuit CPS20 (VT), harness side and power lumbar motor C3216-B, circuit CPS18 (BN/GN), harness side; and between seat control switch C3026-10, circuit CPS21 (WH/OG), harness side and power lumbar motor C3216-A, circuit CPS19 (GY/VT), harness side.  N0040629 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new seat control switch. Seat Control Switch — Front . TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. TEST the system for normal operation.

	DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test Q: A Single Climate Controlled Seat is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the climate controlled seat module (CCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB08 (VT/RD) into CCSM C3265a pins E and F. If power is disconnected from either pin E or F of CCSM C3265a with the power connection remaining on the other circuit, both seats will remain operational because the power feed circuits are connected internally in the CCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a SPDJB device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

Possible Causes

A single climate controlled seat that does not operate can be caused by:

- wiring, terminals or connectors.
- an MS-CAN fault.
- a faulted electronic automatic temperature control (EATC) module.
- a faulted CCSM.

PINPOINT TEST Q: A SINGLE CLIMATE CONTROLLED SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
Q1 CHECK CLIMATE CONTROLLED SEAT OPERATION	
• Check the operation of both climate controlled seats and verify the symptom. • **Does the other climate controlled seat operate?**	**Yes** GO to Q2 . **No** GO to Symptom Chart .
Q2 CHECK FOR CCSM AND EATC DTCS	
• Enter the following diagnostic mode on the diagnostic tool: Climate Controlled Seat Module (CCSM) Self Test/Retrieve DTCs. • Enter the following diagnostic mode on the diagnostic tool: Electronic Automatic Temperature Control (EATC) Self Test/Retrieve DTCs. • **Were any DTCs retrieved during the on-demand self test?**	**Yes** For CCSM DTCs, GO to the Climate Controlled Seat Module (CCSM) Diagnostic Trouble Code (DTC) Table. For EATC DTCs, REFER to Section 412-00 to diagnose the EATC module fault. **No** GO to Q3 .
Q3 CHECK OPERATION OF THE CCSM USING THE SCAN TOOL	
• Enter the following diagnostic mode on the diagnostic tool: Datalogger/CCSM Active Command: Thermal Electric Device (TED) Heat Mode (driver seat) or Passenger Thermal Electric Device (TED) Heat Mode (passenger seat). • Enter the following diagnostic mode on the diagnostic tool: Datalogger/CCSM PID: Driver DATC State Encoded Seat Mode or Passenger DATC State Encoded Seat Mode. • **NOTE:** The CCSM active commands thermal electric device (TED) heat mode (driver seat) and passenger thermal electric device (TED) heat mode (passenger seat) are limited to 15 seconds in the ON state, then turn OFF. • **NOTE:** The CCSM is not the source of the fault if the active command mode is operational and also demonstrates the CCSM is able to receive and process inbound command messages from the communication bus. This indicates the EATC module may not be sending the commands correctly. • Monitor the CCSM PID for the affected seat while using the scan tool to command the seat on. • **Does the affected seat operate using the active command?**	**Yes** GO to Q5 . **No** GO to Q4 .
Q4 CHECK FOR VOLTAGE TO THE CCSM	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect passenger seat safety belt buckle pretensioner C3050. • Disconnect passenger seat side air bag C3052. • Disconnect: CCSM C3265a. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the voltage between CCSM C3265a-F, circuit SBB08 (VT/RD), harness side and CCSM C3265a-E, circuit	**Yes** INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.

SBB08 (VT/RD), harness side and ground.  N0042997 • **Is the voltage greater than 10 volts?**	REPOWER the SRS. REFER to Section 501-20B . **No** VERIFY battery junction box (BJB) fuse 8 (40A) is OK. If OK, REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
Q5 MONITOR THE CCSM PID	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect passenger seat safety belt buckle pretensioner C3050. • Disconnect passenger seat side air bag C3052. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Enter the following diagnostic mode on the diagnostic tool: Datalogger/CCSM PID: Driver DATC State Encoded Seat Mode (driver seat) or Passenger DATC State Encoded Seat Mode (passenger seat). • **NOTE:** Operation of the climate controlled seats repeatedly ON and OFF or repeatedly switching between HEAT and COOL modes may cause a CCSM DTC(s) to set, disabling one or both seat system and may require the DTC(s) to be cleared before seat operation may continue. It is recommended to allow time between modes for seat temperatures to adjust back toward ambient temperatures before continuing. • Monitor the CCSM PID for the driver (or passenger) seat while operating the affected climate controlled seat by selecting HIGH HEAT, MEDIUM HEAT, LOW HEAT and OFF on the EATC module. Then select HIGH COOL, MEDIUM COOL and LOW COOL. • **Do all the PID values match climate controlled seat settings selected on the EATC module?**	**Yes** If the fault is intermittent, CHECK for causes of the intermittent fault. INSPECT the connectors, terminals and wiring. ATTEMPT to recreate the fault by flexing the wire harness and operating the system. CHECK the electrical connectors for corrosion or pushed-out pins. REPAIR any intermittent concerns found. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new EATC module. REFER to Section 412-01 . REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050.

	CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test R: The Power Seat is Inoperative — Third Row Power-Fold, Left and Right Seats

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

Voltage is supplied to the power-fold seat relay coils controlled from the smart power distribution junction box (SPDJB) through circuit CPS48 (BU) enabling the system. Ground is supplied to the power-fold seat relay coils and both left and right seat control switches on circuit GD151 (BK/GN). The power fold seat relays will be provided voltage on the coil side from the SPDJB for 10 minutes when the transmission selector is in PARK and the liftgate, or liftgate glass, is open. The voltage will be disabled 10 minutes after turning the vehicle off. If the voltage is disabled after 10 minutes, it can be re-enabled by opening any door or pressing the unlock key on the key fob.

Possible Causes

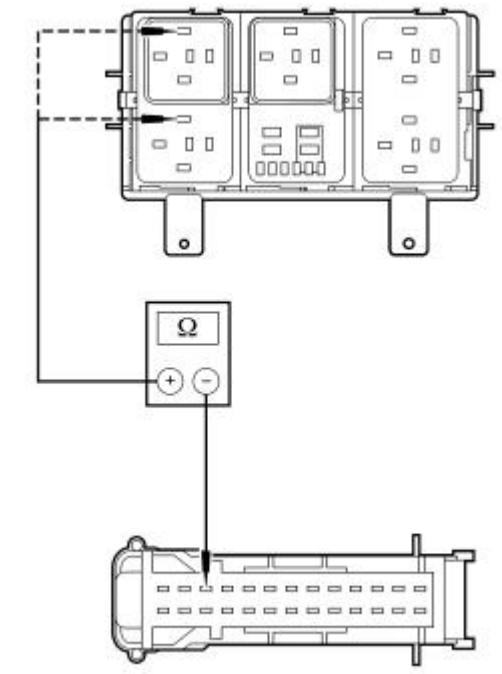
An inoperative third row power-fold seat can be caused by:

- open fuse.
- auxiliary relay box third row power-fold seat relay(s).
- wiring, terminals or connectors.
- a faulty SPDJB.

PINPOINT TEST R: THE POWER SEAT IS INOPERATIVE — THIRD ROW POWER-FOLD, LEFT AND RIGHT SEATS

Test Step	Result / Action to Take
R1 CHECK FOR SMART POWER DISTRIBUTION JUNCTION BOX (SPDJB) DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Smart Power Distrubution Junction Box (SPDJB) Self Test/Retrieve DTCs. • **Are any SPDJB DTCs retrieved?**	**Yes** If DTC B2A2D, key OFF and VERIFY smart junction box fuse 5 (10A) is OK. DISCONNECT SPDJB C2280d and GO to R6 . If DTC B2794, key OFF. DISCONNECT auxiliary relay box left and right third row power-fold seat relays and GO to R3 . For all other SPDJB DTCs, REFER to Diagnostic Trouble Code (DTC) Chart in Section 419-10 . **No** GO to R2 .

R2 CHECK FOR VOLTAGE TO THE RELAYS	
• Key in OFF position. • Disconnect: Left Third Row Power-Fold Seat Relay. • Disconnect: Right Third Row Power-Fold Seat Relay. • Key in ON position. • Measure the voltage between auxiliary relay box left and right third row power-fold seat relay terminals 85, circuit CPS48 (BU), harness side and ground.  N0053850 • **Is the voltage greater than 10 volts?**	**Yes** GO to R3 . **No** Key OFF. DISCONNECT SPDJB C2280d. GO to R5 .
R3 CHECK FOR FAULTY RELAYS	
• Carry-out the component test on the auxiliary relay box left and right third row power-fold seat relays. Refer to Wiring Diagrams Cell 149 , Component Testing for schematic and connector information. • **Did both relays pass the component test?**	**Yes** GO to R4 . **No** INSTALL a new relay(s). REPEAT the self-test. CLEAR the DTCs.
R4 CHECK CIRCUIT CPS48 (BU) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Smart Power Distribution Junction Box (SPDJB) C2280d. • Key in ON position. • Measure the voltage between auxiliary relay box left and right third row power-fold seat relay terminals 85, circuit CPS48 (BU), harness side and ground.  N0053850 • **Is voltage present?**	**Yes** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. **No** GO to R5 .
R5 CHECK CIRCUIT CPS48 (BU) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between auxiliary relay box left and right third row power-fold seat relay terminals 85, circuit CPS48 (BU), harness side and SPDJB C2280d-24, circuit CPS48 (BU), harness side.	**Yes** GO to R6 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.



N0053851

- **Is the resistance less than 5 ohms?**

R6 CHECK CIRCUIT CPS48 (BU) FOR A SHORT TO GROUND	
• Measure the resistance between auxiliary relay box left and right power-fold seat relay terminals 85, circuit CPS48 (BU), harness side and ground.  N0053852 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to R7 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.
R7 CHECK GROUND CIRCUIT GD151 (BK/GN) FOR OPEN	
• Measure the resistance between auxiliary relay box left and right third row power-fold seat relay terminals 86, circuit GD151 (BK/GN), harness side and ground.  N0053853 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new SPDJB. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

Pinpoint Test S: The Power Seat is Inoperative/Does Not Operate Correctly — Third Row Power-Fold, Left Seat

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Refer to Wiring Diagrams Cell 149 , Component Testing for schematic and connector information.

Normal Operation

Battery voltage is supplied from the battery junction box (BJB) to the switch side of left third row power-fold seat relay through circuit SBB04 (GN/RD) and is hot at all times. When the smart power distribution junction box (SPDJB) energizes the left power-fold seat relay circuit CPS48 (BU), battery voltage is switched through the relay to the left power-fold seat control switch on circuit SBB31 (WH/RD). Ground is supplied to the left power-fold seat control switch through circuit GD151 (BK/GN). When the left third row power-fold seat control switch is pressed, battery voltage and ground is supplied to the left power-fold seat motor. Pressing the switch in the opposite direction, reverses the polarity to the left power-fold seat motor, which moves the third row seat backrest in the opposite direction.

Possible Causes

An inoperative third row power-fold seat can be caused by:

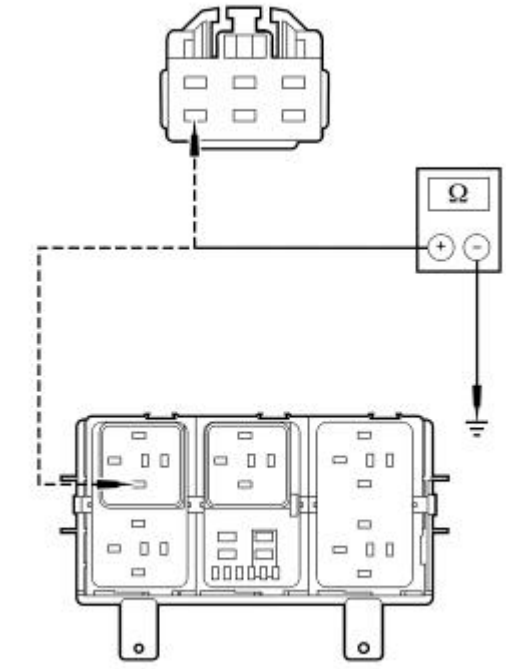
- fuse(s).
- wiring, terminals or connectors.
- a faulty left third row power-fold seat control switch.
- a faulty left third row power-fold seat relay.
- a faulty left third row power-fold seat motor.

PINPOINT TEST S: THE POWER SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY — THIRD ROW POWER-FOLD, LEFT SEAT

Test Step	Result / Action to Take
S1 CHECK CIRCUIT SBB04 (GN/RD) FOR AN OPEN	
• Disconnect: Left Third Row Power-Fold Seat Relay. • Key in ON position. • Measure the voltage between auxiliary relay box left third row power-fold seat relay terminal 30, circuit SBB04 (GN/RD), harness side and ground.  N0053854 • **Is the voltage greater than 10 volts?**	**Yes** GO to S2 . **No** VERIFY battery junction box (BJB) fuse 4 (30A) is OK. If OK, REPAIR the circuit. If the fuse is open, INSTALL a new fuse and RE-TEST the circuit for greater than 10 volts. If the fuse opens again or voltage is not present, REPAIR the circuit. TEST the system for normal operation. Otherwise, GO to S6 .
S2 CHECK CIRCUIT CPS48 (BU) FOR VOLTAGE	
• Measure the voltage between left third row seat relay terminal 85, circuit CPS48 (BU), harness side and ground.	**Yes** GO to S3 . **No**

 N0053855 • **Is the voltage greater than 10 volts?**	CHECK operation of the right side power-fold seat. If the right side power-fold seat is operational, REPAIR the circuit. TEST the system for normal operation. Otherwise, Go To Pinpoint Test R .
S3 CHECK CIRCUIT GD151 (BK/GN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between auxiliary relay box left third row power-fold seat relay terminal 86, circuit GD151 (BK/GN), harness side and ground.  N0053856 • **Is the resistance less than 5 ohms?**	**Yes** GO to S4 . **No** REPAIR the circuit. TEST the system for normal operation.
S4 CHECK LEFT THIRD ROW SEAT RELAY	
• Carry out the component test on the left third row power-fold seat relay. Refer to Wiring Diagrams Cell 149 , Component Testing for schematic and connector information. • **Did the relay pass the component test?**	**Yes** GO to S5 . **No** INSTALL a new left third row power-fold seat relay. TEST the system for normal operation.
S5 CHECK CIRCUIT SBB31 (WH/RD) FOR A SHORT TO VOLTAGE	
• Disconnect: Left Rear Third Row Seat Control Switch C4179. • Key in ON position. • Measure the voltage between auxiliary relay box left rear third row power-fold seat relay terminal 87, circuit SBB31 (WH/RD), harness side and ground.  N0053857 • **Is voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to S6 .
S6 CHECK CIRCUIT SBB31 (WH/RD) FOR A SHORT TO GROUND	

• Key in OFF position. • Measure the resistance between auxiliary relay box left third row power-fold seat relay terminal 87, circuit SBB31 (WH/RD), harness side and ground.  N0053858 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S7 . **No** REPAIR the circuit. TEST the system for normal operation.
S7 CHECK CIRCUIT SBB31 (WH/RD) FOR AN OPEN	
• Measure the resistance between auxiliary relay box left third row power-fold seat relay terminal 87, circuit SBB31 (WH/RD), harness side and left third row seat control switch C4179-2, circuit SBB31 (WH/RD), harness side.  N0053859 • **Is the resistance less than 5 ohms?**	**Yes** GO to S8 . **No** REPAIR the circuit. TEST the system for normal operation.
S8 CHECK CIRCUIT GD151 (BK/GN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between left third row power-fold seat relay terminal 86, circuit GD151 (BK/GN), harness side and ground; and between left third row power-fold seat control switch C4179-6, circuit GD151 (BK/GN), harness side and ground.	**Yes** GO to S9 . **No** REPAIR the circuit. TEST the system for normal operation.



N0053860

- **Is the resistance less than 5 ohms?**

S9 CHECK LEFT THIRD ROW POWER-FOLD SEAT CONTROL SWITCH	
• Using the following table to check the left power-fold seat switch, measure the resistance between the switch pins, component side, while pressing the switch buttons in the indicated position and compare the results to the table. **Switch Position / Pins / Ohms** Up / 2 and 5 / Less than 5 Down / 2 and 5 / Greater than 10,000 Down / 2 and 1 / Less than 5 Up / 2 and 1 / Greater than 10,000 Up and at Rest / 1 and 6 / Less than 5 Down / 1 and 6 / Greater than 10,000 Down and at Rest / 5 and 6 / Less than 5 Up / 5 and 6 / Greater than 10,000 • **Is the switch OK?**	**Yes** GO to S10 . **No** INSTALL a switch. REFER to Seat Control Switch — Third Row . TEST the system for normal operation.
S10 CHECK CIRCUIT CPS50 (BU/BN) AND CPS49 (BN/GN) FOR A SHORT TO POWER	
• Key in ON position. • Measure the voltage between left third row power-fold seat control switch C4179-5, circuit CPS50 (BU/BN) and ground; and between C4179-1, circuit CPS49 (BN/GN) harness side and ground.	**Yes** REPAIR the circuit(s). TEST the system for normal operation. **No** GO to S11 .

 N0053861 • **Is voltage present?**	
S11 CHECK CIRCUIT CPS50 (BU/BN) AND CPS49 (BN/GN) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between left third row power-fold seat control switch C4179-5, circuit CPS50 (BU/BN) and ground; and between left third row power-fold seat control switch C4179-1, circuit CPS49 (BN/GN) harness side and ground.  N0053862 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S12 . **No** REPAIR the circuit(s). TEST the system for normal operation.
S12 CHECK CIRCUITS CPS49 (BN/GN) AND CPS50 (BU/BN) FOR AN OPEN	
• Disconnect: Left Third Row Seat Motor C4181. • Measure the resistance between left third row power-fold seat control switch C4179-5, circuit CPS50 (BU/BN), harness side and left third row power-fold seat motor C4181-2, circuit CPS50 (BU/BN) or circuit CPS52 (YE/GN) (Expedition EL), harness side; and between left third row power-fold seat control switch, C4179-1, circuit CPS49 (BN/GN), harness side and left third row power-fold seat motor C4181-1, circuit CPS49 (BN/GN) or circuit CPS51 (VT/GN) (Expedition EL), harness side.  N0053863 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new left third row power-fold seat motor. REFER to Power-Fold Seat Motor . TEST the system for normal operation. **No** REPAIR the circuit(s). TEST the system for normal operation.

Pinpoint Test T: The Power Seat is Inoperative/Does Not Operate Correctly — Third Row Power-Fold, Right Seat

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Refer to Wiring Diagrams Cell 149 , Component Testing for schematic and connector information.

Normal Operation

Battery voltage is supplied from the battery junction box (BJB) to the switch side of right third row power-fold seat relay through circuit SBB38 (BN/RD) and is hot at all times. When the smart power distribution junction box (SPDJB) energizes the right power-fold seat relay, battery voltage is switched through the relay to the right power-fold seat control switch on circuit SBB32 (VT/RD). Ground is supplied to the right power-fold seat control switch through circuit GD151 (BK/GN). When the right third row power-fold seat control switch is pressed, battery voltage and ground is supplied to the right power-fold seat motor. Pressing the switch in the opposite direction, reverses the polarity to the right power-fold seat motor, which moves the third row seat backrest in the opposite direction.

Possible Causes

An inoperative third row power-fold seat can be caused by:

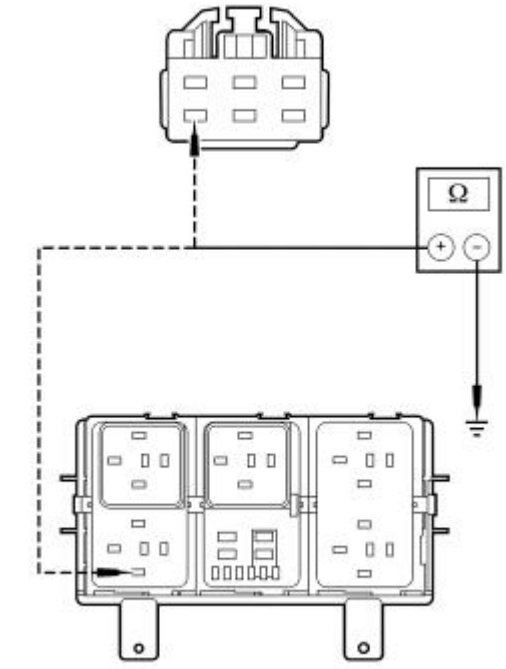
- fuse(s).
- wiring, terminals or connectors.
- a faulty right third row power-fold seat control switch.
- a faulty right third row power-fold seat relay.
- a faulty right third row power-fold seat motor.
- a faulty SPDJB.

PINPOINT TEST T: THE POWER SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY — THIRD ROW POWER-FOLD, RIGHT SEAT

Test Step	Result / Action to Take
T1 CHECK CIRCUIT SBB38 (BN/RD) FOR AN OPEN	
• Key in ON position. • Measure the voltage between auxiliary relay box right third row power-fold seat relay terminal 30, circuit SBB38 (BN/RD), harness side and ground.  N0053864 • **Is the voltage greater than 10 volts?**	**Yes** GO to T2 . **No** VERIFY battery junction box (BJB) fuse 38 (30A) is OK. If OK, REPAIR the circuit. If the fuse is open, INSTALL a new fuse and RE-TEST the circuit for greater than 10 volts. If the fuse opens again or voltage is not present, REPAIR the circuit. TEST the system for normal operation. Otherwise, GO to T6 .
T2 CHECK CIRCUIT CPS48 (BU) FOR VOLTAGE	
• Measure the voltage between auxiliary relay box right third row power-fold seat relay terminal 85, circuit CPS48 (BU), harness side and ground.	**Yes** GO to T3 . **No** CHECK operation of the left side power-fold seat. If the left side power-fold

 N0053865 • **Is the voltage greater than 10 volts?**	seat is operational, REPAIR the circuit. TEST the system for normal operation. Otherwise, Go To Pinpoint Test S .
T3 CHECK CIRCUIT GD151 (BK/GN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between auxiliary relay box right third row power-fold seat relay terminal 86, circuit GD151 (BK/GN), harness side and ground.  N0053866 • **Is the resistance less than 5 ohms?**	**Yes** GO to T4 . **No** REPAIR the circuit. TEST the system for normal operation.
T4 CHECK RIGHT THIRD ROW POWER-FOLD SEAT RELAY	
• Carry out component test on the right third row power-fold seat relay. Refer to Wiring Diagrams Cell 149 , Component Testing for schematic and connector information. • **Did the relay pass the component test?**	**Yes** GO to T5 . **No** INSTALL a new right third row power-fold seat relay. TEST the system for normal operation.
T5 CHECK CIRCUIT SBB32 (VT/RD) FOR A SHORT TO POWER	
• Disconnect: Right Third Row Power-Fold Seat Control Switch C4180. • Key in ON position. • Measure the voltage between auxiliary relay box right third row power-fold seat relay terminal 87, circuit SBB32 (VT/RD), harness side and ground.  N0053867 • **Is voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to T6 .

T6 CHECK CIRCUIT SBB32 (VT/RD) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between auxiliary relay box right third row power-fold seat relay terminal 87, circuit SBB32 (VT/RD), harness side and ground.  N0053868 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to T7 . **No** REPAIR the circuit. TEST the system for normal operation.
T7 CHECK CIRCUIT SBB32 (VT/RD) FOR AN OPEN	
• Measure the resistance between auxiliary relay box right third row power-fold seat relay terminal 87, circuit SBB32 (VT/RD), harness side and right third row power-fold seat control switch C4180-2, circuit SBB32 (VT/RD), harness side.  N0053869 • **Is the resistance less than 5 ohms?**	**Yes** GO to T8 . **No** REPAIR the circuit. TEST the system for normal operation.
T8 CHECK CIRCUIT GD151 (BK/GN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between auxiliary relay box right third row power-fold seat relay terminal 86, circuit GD151 (BK/GN), harness side and ground; and between right third row power-fold seat control switch C4180-6, circuit GD151 (BK/GN), harness side and ground.	**Yes** GO to T9 . **No** REPAIR the circuit. TEST the system for normal operation.



N0053891

- **Is the resistance less than 5 ohms?**

T9 CHECK RIGHT THIRD ROW POWER-FOLD SEAT CONTROL SWITCH	
• Using the following table to check the right power-fold seat switch, measure the resistance between the switch pins, component side, while pressing the switch buttons in the indicated position and compare the results to the table. **Switch Position / Pins / Ohms** Up / 2 and 5 / Less than 5 Down / 2 and 5 / Greater than 10,000 Down / 2 and 1 / Less than 5 Up / 2 and 1 / Greater than 10,000 Up and at Rest / 1 and 6 / Less than 5 Down / 1 and 6 / Greater than 10,000 Down and at Rest / 5 and 6 / Less than 5 Up / 5 and 6 / Greater than 10,000 • **Is the switch OK?**	**Yes** GO to T10 . **No** INSTALL a new switch. REFER to Seat Control Switch — Third Row . TEST the system for normal operation.
T10 CHECK CIRCUIT CPS51 (VT/GY) AND CPS52 (YE/GN) FOR A SHORT TO POWER	
• Key in ON position. • Measure the voltage between right third row power-fold seat control switch C4180-5, circuit CPS51 (VT/GY) and C4180-1, circuit CPS52 (YE/GN) harness side and ground.	**Yes** REPAIR the circuit(s). TEST the system for normal operation. **No** GO to T11 .

 N0053861 • **Is voltage present?**	
T11 CHECK CIRCUIT CPS51 (VT/GY) AND CPS52 (YE/GN) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between right third row power-fold seat control switch C4180-5, circuit CPS51 (VT/GY) and C4180-1, circuit CPS52 (YE/GN) harness side and ground.  N0053862 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to T12 . **No** REPAIR the affected circuit. TEST the system for normal operation.
T12 CHECK CIRCUIT CPS51 (VT/GY) AND CPS52 (YE/GN) FOR AN OPEN	
• Disconnect: Right Third Row Power-Fold Seat Motor C4182. • Measure the resistance between right third row power-fold seat control switch C4180-5, circuit CPS51 (VT/GY), harness side and right third row power-fold seat motor C4182-1, circuit CPS51 (VT/GY) harness side; and between right third row power-fold seat control switch, C4180-1, circuit CPS52 (YE/GN), harness side and right third row power-fold seat motor C4182-2, circuit CPS52 (YE/GN), harness side.  N0053863 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new right third row power-fold seat motor. REFER to Power-Fold Seat Motor . TEST the system for normal operation. **No** REPAIR the circuit(s). TEST the system for normal operation.

Pinpoint Test U: DTC B103B/B1111 — Thermoelectric Driver Overcurrent Low/Driver Thermoelectric Device Control Overtemperature Fault

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the climate controlled seat module (CCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB08 (VT/RD) into CCSM C3265a pins E and F. If power is disconnected from either pin E or F of CCSM C3265a with the power connection remaining on the other circuit, both seats will remain operational because the power feed circuits are connected internally in the CCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

Possible Causes

A TED driver overcurrent low or device control overtemperature fault can be caused by:

- wiring, terminals or connectors.
- a faulted TED assembly.
- a faulted CCSM.

PINPOINT TEST U: DTC B103B/B1111 — THERMOELECTRIC DRIVER OVERCURRENT LOW/DRIVER THERMOELECTRIC DEVICE CONTROL OVERTEMPERATURE FAULT

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
U1 CHECK THE TED CIRCUITS FOR SHORT TO GROUND	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. • Disconnect driver seat side air bag C3051 and passenger seat side air bag C3052. • Disconnect: CCSM C3265a. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the resistance between the following CCSM C3265a pins, harness side and ground.	**Yes** GO to U2 . **No** If the resistances of C3265a-G, circuit CHS02 (YE/BU) and/or C3265a-H, circuit RHS02 (BU/OG) to ground were **not** greater than 10,000 ohms to ground, GO to U6 . If resistances of C3265a-J, circuit CHS01 (GY/VT) and/or C3265a-K, circuit RHS01 (WH/VT) to ground were **not** greater

Connector-Pin	Circuit
C3265a-G	CHS02 (YE/BU)
C3265a-H	RHS02 (BU/OG)
C3265a-J	CHS01 (GY/VT)
C3265a-K	RHS01 (WH/VT)

- **Are the resistances greater than 10,000 ohms?**

than 10,000 ohms to ground, GO to U7 .

U2 CHECK THE TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between the following CCSM C3265a pins, harness side and ground.

Connector-Pin	Circuit
C3265a-G	CHS02 (YE/BU)
C3265a-H	RHS02 (BU/OG)
C3265a-J	CHS01 (GY/VT)
C3265a-K	RHS01 (WH/VT)

- **Are the voltages less than one volt?**

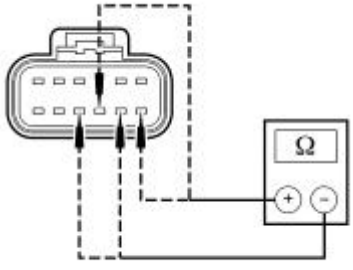
No
GO to U3 .

No
If the voltages measured at C3265a-G and/or C3265a-H were **not** less than one volt, GO to U8 .

If voltages measured at C3265a-J and/or C3265a-K were **not** less than one volt, GO to U9 .

U3 CHECK THE TED RESISTANCE

- Key in OFF position.
- **CAUTION: Make sure the TEDs are at room temperature and there is no air blowing across the TEDs. Do not handle a TED when measuring resistance. These conditions can cause incorrect readings and lead to incorrect identification of components that are not faulty.**
- Measure the resistance between CCSM C3265a-G, circuit CHS02 (YE/BU), harness side and CCSM C3265a-H, circuit RHS02 (BU/OG), harness side; and between CCSM C3265a-J, circuit CHS01 (GY/VT), harness side and C3265a-K, circuit RHS01 (WH/VT), harness die and ground.



N0042873

- **Are the resistances between 0.9 and 10 ohms?**

Yes
INSTALL a new CCSM. REFER to Climate Controlled Seat Module . REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050.

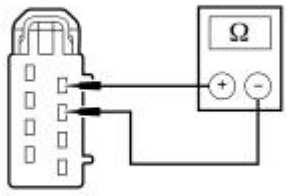
CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

No
If the resistance between CCSM C3265a-G and C3265a-H was **not** between 0.9 and 10 ohms, GO to U5 .

If the resistance between CCSM C3265a-J and C3265a-K was **not**

	between 0.9 and 10 ohms, GO to U4 .
U4 CHECK THE RESISTANCE OF THE BACKREST TED	
• Disconnect: Backrest TED C3034. • Measure the resistance between backrest TED C3034 pin 1 and pin 3, component side.  N0053766 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
U5 CHECK THE RESISTANCE OF THE CUSHION TED	
• Disconnect: Cushion TED C3035. • Measure the resistance between cushion TED C3035 pin 1 and pin 3, component side.	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner



N0042874

- **Is the resistance between 0.9 and 10 ohms?**

C3049 and passenger seat safety belt buckle pretensioner C3050.

CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

No
INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs.

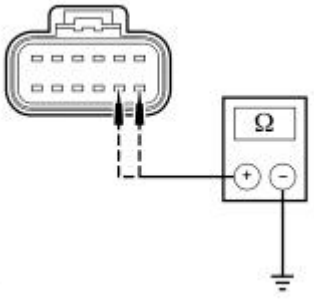
DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050.

CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

U6 CHECK THE CUSHION TED CIRCUITS FOR SHORT TO GROUND

- Disconnect: Cushion TED C3035.
- Measure the resistance between CCSM C3265a-G, circuit CHS02 (YE/BU), harness side and ground and between C3265a-H, circuit RHS02 (BU/OG), harness side and ground.



N0042875

- **Are the resistances greater than 10,000 ohms?**

Yes
INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050.

CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.

	REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
U7 CHECK THE BACKREST TED CIRCUITS FOR SHORT TO GROUND	
• Disconnect: Backrest TED C3034. • Measure the resistance between CCSM C3265a-J, circuit CHS01 (GY/VT), harness side and ground and between C3265a-K, circuit RHS01 (WH/VT), harness side and ground.  • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT

	driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
U8 CHECK THE CUSHION TED CIRCUITS FOR SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Cushion TED C3035. • Key in ON position. • Measure the voltage between CCSM C3265a-G, circuit CHS02 (YE/BU), harness side and ground and between C3265a-H, circuit RHS02 (BU/OG), harness side and ground.  N0042877 • **Are the voltages less than one volt?**	**Yes** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.

	REPOWER the SRS. REFER to Section 501-20B .
U9 CHECK THE BACKREST TED CIRCUITS FOR SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Backrest TED C3034. • Key in ON position. • Measure the voltage between CCSM C3265a-J, circuit CHS01 (GY/VT), harness side and ground and between C3265a-K, circuit RHS01 (WH/VT), harness side and ground.  N0042878 • **Are the voltages less than one volt?**	**Yes** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test V: DTC B103C — Thermoelectric Driver Open Load

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the climate controlled seat module (CCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB08 (VT/RD) into CCSM C3265a pins E and F. If power is disconnected from either pin E or F of CCSM C3265a with the power connection remaining on the other circuit, both seats will remain operational because the power feed circuits are connected internally in the CCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

Possible Causes

A TED driver open load fault can be caused by:

- wiring, terminals or connectors.
- a faulted TED assembly.
- a faulted CCSM.

PINPOINT TEST V: DTC B103C — THERMOELECTRIC DRIVER OPEN LOAD

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
V1 CHECK THE TED CIRCUITS FOR AN OPEN	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. • Disconnect driver seat side air bag C3051 and passenger seat side air bag C3052. • Disconnect: CCSM C3265a. • Disconnect: Cushion TED C3035. • Disconnect: Backrest TED C3034. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the resistance of the following circuits.	**Yes** GO to V2 . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.

CCSM Connector-Pin	Circuit	TED Connector-Pin
C3265a-G	CHS02 (YE/BU)	C3035-1
C3265a-H	RHS02 (BU/OG)	C3035-3
C3265a-J	CHS01 (GY/VT)	C3034-1
C3265a-K	RHS01 (WH/VT)	C3034-3

- **Are the resistances less than 5 ohms?**

REPOWER the SRS. REFER to Section 501-20B .

V2 CHECK THE TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between the following CCSM C3265a pins, harness side and ground.

Connector-Pin	Circuit
C3265a-G	CHS02 (YE/BU)
C3265a-H	RHS02 (BU/OG)
C3265a-J	CHS01 (GY/VT)
C3265a-K	RHS01 (WH/VT)

- **Is voltage present on any circuit?**

Yes
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050.

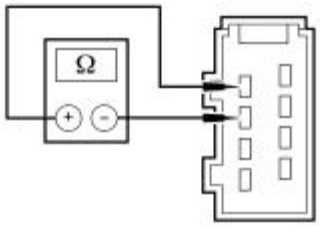
CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

No
GO to V3 .

V3 CHECK RESISTANCE OF THE TEDs

- Key in OFF position.
- Measure the resistance between backrest TED C3034 pin 1 and pin 3, component side and between cushion TED C3034 pin 1 and pin 3, component side.



N0053766

- **Are the resistances between 0.9 and 10 ohms?**

Yes
INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050.

CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

	No If the resistance of the backrest TED was **not** between 0.9 and 10 ohms, INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. If the resistance of the cushion TED was **not** between 0.9 and 10 ohms, INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test W: DTC B103D — Blower Driver Overtemperature

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the climate controlled seat module (CCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB08 (VT/RD) into CCSM C3265a pins E and F. If power is disconnected from either pin E or F of CCSM C3265a with the power connection remaining on the other circuit, both seats will remain operational because the power feed circuits are connected internally in the CCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

Possible Causes

A blower overtemperature fault can be caused by:

- wiring, terminals or connectors.
- a faulted TED assembly.
- a faulted CCSM.

PINPOINT TEST W: DTC B103D — BLOWER DRIVER OVERTEMPERATURE

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
W1 CHECK THE BLOWER CIRCUIT FOR AN OPEN	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. • Disconnect driver seat side air bag C3051 and passenger seat side air bag C3052. • Disconnect: CCSM C3265c. • Disconnect: Cushion TED C3035. • Disconnect: Backrest TED C3034. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the resistance between CCSM C3265c-16, circuit CHS13 (VT/BN), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to W2 . **No** REPAIR the affected circuit. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
W2 CHECK THE BLOWER CIRCUITS FOR A SHORT	
• Measure the resistance between CCSM C3265c-15, circuit CHS03 (GN/BN), harness side and C3265c-16, circuit CHS13 (VT/BN), harness side.	**Yes** GO to W3 . **No** REPAIR the affected circuits. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery

 N0044847 • **Is the resistance greater than 10,000 ohms?**	ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
W3 CHECK THE BLOWER RESISTANCE • **CAUTION: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between cushion TED C3035 pin 2 and pin 4, component side and between backrest TED C3034 pin 2 and pin 4, component side.  N0054027 • **Are the resistances between 6,000 ohms and 9,000 ohms?**	**Yes** INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs. **No** If the resistance of the cushion TED was **not** between 6,000 and 9,000 ohms, INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. If the resistance of the backrest TED was **not** between 6,000 and 9,000 ohms, INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test X: DTC B1113/B111B — Passenger Thermoelectric Device Control Overtemperature Fault/Passenger Thermoelectric Driver Overcurrent Low

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the climate controlled seat module (CCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB08 (VT/RD) into CCSM C3265a pins E and F. If power is disconnected from either pin E or F of CCSM C3265a with the power connection remaining on the other circuit, both seats will remain operational because the power feed circuits are connected internally in the CCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

Possible Causes

A TED device control overtemperature or overcurrent low fault can be caused by:

- wiring, terminals or connectors.
- a faulted TED assembly.
- a faulted CCSM.

PINPOINT TEST X: DTC B1113/B111B — PASSENGER THERMOELECTRIC DEVICE CONTROL OVERTEMPERATURE FAULT/PASSENGER THERMOELECTRIC DRIVER OVERCURRENT LOW

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
X1 CHECK THE TED CIRCUITS FOR SHORT TO GROUND	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect passenger seat safety belt buckle pretensioner C3050. • Disconnect passenger seat side air bag C3052. • Disconnect: CCSM C3265a. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.**	**Yes** GO to X2 . **No** If the resistances of C3265a-A and/or C3265a-B to ground were **not** greater than 10,000 ohms to ground, GO to X6 . If resistances of C3265a-C

- Connect the battery ground cable.
- Measure the resistance between the following CCSM C3265a pins, harness side and ground.

Connector-Pin	Circuit
C3265a-A	CHS07 (GY/BU)
C3265a-B	RHS07 (BU)
C3265a-C	CHS06 (BU/BN)
C3265a-D	RHS06 (WH)

- **Are the resistances greater than 10,000 ohms?**

and/or C3265a-D to ground were **not** greater than 10,000 ohms to ground, GO to X7 .

X2 CHECK THE TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between the following CCSM C3265a pins, harness side and ground.

Connector-Pin	Circuit
C3265a-A	CHS07 (GY/BU)
C3265a-B	RHS07 (BU)
C3265a-C	CHS06 (BU/BN)
C3265a-D	RHS06 (WH)

- **Are the voltages less than one volt?**

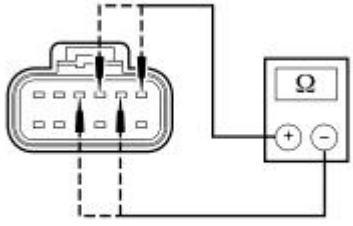
No
GO to X3 .

No
If the voltages measured at C3265a-A and/or C3265a-B were **not** less than one volt, GO to X8 .

If voltages measured at C3265a-C and/or C3265a-D were **not** less than one volt, GO to X9 .

X3 CHECK THE TED RESISTANCE

- Key in OFF position.
- **CAUTION: Make sure the TEDs are at room temperature and there is no air blowing across the TEDs. Do not handle a TED when measuring resistance. These conditions can cause incorrect readings and lead to incorrect identification of components that are not faulty.**
- Measure the resistance between CCSM C3265a-A, circuit CHS07 (GY/BU), harness side and CCSM C3265a-B, circuit RHS07 (BU), harness side; and between CCSM C3265a-C, circuit CHS06 (BU/BN), harness side and C3265a-D, circuit RHS06 (WH), harness side and ground.



N0042882

- **Are the resistances between 0.9 and 10 ohms?**

Yes
INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.

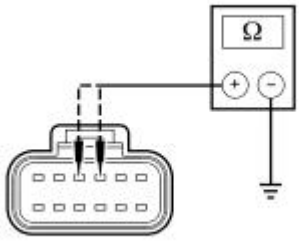
REPOWER the SRS. REFER to Section 501-20B .

No
If the resistance between CCSM C3265a-A and C3265a-B was **not** between 0.9 and 10 ohms, GO to X5 .

If the resistance between CCSM C3265a-C and

	C3265a-D was **not** between 0.9 and 10 ohms, GO to X4 .
X4 CHECK THE RESISTANCE OF THE BACKREST TED	
• Disconnect: Backrest TED C3039 (10-Way Power Seat) or C3316 (6-Way Power Seat). • Measure the resistance between backrest TED C3039 (10-way power seat) or C3316 (6-way power seat) pin 1 and pin 3, component side.  N0053766 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
X5 CHECK THE RESISTANCE OF THE CUSHION TED	
• Disconnect: Cushion TED C3040. • Measure the resistance between cushion TED C3040 pin 1 and pin 3, component side.  N0042874 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new cushion TED. REFER to Seat

	Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
X6 CHECK THE CUSHION TED CIRCUITS FOR SHORT TO GROUND • Disconnect: Cushion TED C3040. • Measure the resistance between CCSM C3265a-A, circuit CHS07 (GY/BU), harness side and ground and between C3265a-B, circuit RHS07 (BU), harness side and ground.  N0042883 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
X7 CHECK THE BACKREST TED CIRCUITS FOR SHORT TO GROUND • Disconnect: Backrest TED C3039 (10-Way Power Seat) or C3316 (6-Way Power Seat). • Measure the resistance between CCSM C3265a-C, circuit CHS06 (BU/BN), harness side and ground and between C3265a-D, circuit RHS06 (WH), harness side and ground.	**Yes** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section.



N0042884

- **Are the resistances greater than 10,000 ohms?**

REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

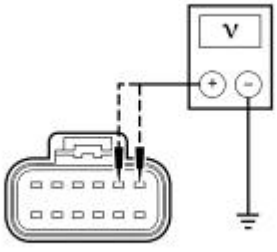
No
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

X8 CHECK THE CUSHION TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Cushion TED C3040.
- Key in ON position.
- Measure the voltage between CCSM C3265a-A, circuit CHS07 (GY/BU), harness side and ground and between C3265a-B, circuit RHS07 (BU), harness side and ground.



N0042885

- **Are the voltages less than one volt?**

Yes
INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

No
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner

	C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
X9 CHECK THE BACKREST TED CIRCUITS FOR SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Backrest TED C3039 (10-Way Power Seat) or C3316 (6-Way Power Seat). • Key in ON position. • Measure the voltage between CCSM C3265a-C, circuit CHS06 (BU/BN), harness side and ground and between C3265a-D, circuit RHS06 (WH), harness side and ground.  N0042886 • **Are the voltages less than one volt?**	**Yes** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test Y: DTC B111C — Passenger Thermoelectric Driver Open Load

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the climate controlled seat module (CCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB08 (VT/RD) into CCSM C3265a pins E and F. If power is disconnected from either pin E or F of CCSM C3265a with the power connection remaining on the other circuit, both seats will remain operational because the power feed circuits are connected internally in the CCSM. However, if a

fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

Possible Causes

A TED driver open load fault can be caused by:

- wiring, terminals or connectors.
- a faulted TED assembly.
- a faulted CCSM.

PINPOINT TEST Y: DTC B111C — PASSENGER THERMOELECTRIC DRIVER OPEN LOAD

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Pinpoint Test Z: DTC B111D — Passenger Blower Driver Overtemperature

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the climate controlled seat module (CCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB08 (VT/RD) into CCSM C3265a pins E and F. If power is disconnected from either pin E or F of CCSM C3265a with the power connection remaining on the other circuit, both seats will remain operational because the power feed circuits are connected internally in the CCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

Possible Causes

A blower overtemperature fault can be caused by:

- wiring, terminals or connectors.
- a faulted TED assembly.
- a faulted CCSM.

PINPOINT TEST Z: DTC B111D — PASSENGER BLOWER DRIVER OVERTEMPERATURE

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
Z1 CHECK THE BLOWER CIRCUIT FOR AN OPEN • Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect passenger seat safety belt buckle pretensioner C3050. • Disconnect passenger seat side air bag C3052. • Disconnect: CCSM C3265c. • Disconnect: Cushion TED C3040. • Disconnect: Backrest TED C3039 (10-Way Power Seat) or C3316 (6-Way Power Seat). • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the resistance between CCSM C3265c-8, circuit CHS14 (GN), harness side and ground.  N0044848 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to Z2 . **No** REPAIR the affected circuit. REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
Z2 CHECK THE BLOWER CIRCUITS FOR A SHORT • Measure the resistance between CCSM C3265c-7, circuit CHS08 (BN/YE), harness side and C3265c-8, circuit CHS14 (GN), harness side.  N0044849 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to Z3 . **No** REPAIR the affected circuits. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
Z3 CHECK THE BLOWER RESISTANCE • **CAUTION: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between cushion TED C3040 pin 2	**Yes** INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the

and pin 4, component side and between backrest TED C3039 (10-way power seat) or C3316 (6-way power seat) pin 2 and pin 4, component side.  N0054027 • **Are the resistances between 6,000 ohms and 9,000 ohms?**	self-test. CLEAR the DTCs. **No** If the resistance of the cushion TED was **not** between 6,000 and 9,000 ohms, INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. If the resistance of the backrest TED was **not** between 6,000 and 9,000 ohms, INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test AA: DTC B2729 — Driver Cushion Over-Temp Detected

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the climate controlled seat module (CCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB08 (VT/RD) into CCSM C3265a pins E and F. If power is disconnected from either pin E or F of CCSM C3265a with the power connection remaining on the other circuit, both seats will remain operational because the power feed circuits are connected internally in the CCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

Possible Causes

A driver seat cushion over-temp fault can be caused by:

- wiring, terminals or connectors.
- restricted cushion TED filter.
- crushed or restricted cushion foam pad.
- crushed or restricted climate controlled seat manifold.
- a faulted cushion TED assembly.
- a faulted CCSM.

PINPOINT TEST AA: DTC B2729 — DRIVER CUSHION OVER-TEMP DETECTED

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AA1 CHECK THE CCSM FOR ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Climate Controlled Seat Module (CCSM) Self Test/Retrieve DTCs. • **Was DTC B2729 retrieved during the on-demand self test?**	**Yes** GO to AA2 . **No** GO to AA4 .
AA2 CHECK THE TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. • Disconnect driver seat side air bag C3051 and passenger seat side air bag C3052. • Disconnect: CCSM C3265b. • Disconnect: Cushion TED C3035. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the resistance between CCSM C3265b-7, circuit VHS26 (VT), harness side and ground and between CCSM C3265b-8, circuit RHS05 (YE/VT), harness side and ground.  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to AA3 . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

AA3 CHECK THE TED THERMISTOR	
• Measure the resistance between cushion TED C3035 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table. **Temperature** / **Resistance** 0-10°C (32-50°F) / 2782-1663 ohms 10-20°C (50-68°F) / 1837-1140 ohms 20-30°C (68-86°F) / 1260-806 ohms 30-40°C (86-104°F) / 893-570 ohms 40-50°C (104-122°F) / 630-428 ohms  N0042890 • **Is the resistance within the limits indicated?**	**Yes** REPAIR the affected open circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AA4 CONFIRM THE FAULT	
• Verify with the customer that the concern is the seat shuts OFF in HEAT mode. • **NOTE:** A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault. • Attempt to recreate the fault. Start the vehicle and set the driver seat to HIGH HEAT for at least 15 minutes. • **Is the customer concern with the seat shutting OFF in HEAT mode or was the fault recreated?**	**Yes** GO to AA5 . **No** Fault not present. Fault may have been set due to a past failure or incorrect use of the climate controlled seat system by repeated switching between HEAT and COOL modes. REPEAT the self-test. CLEAR the DTCs.

AA5 CHECK OPERATION OF THE SEAT	
• Key in ON position. • With the engine running, set both front seats to HIGH COOL (3 LEDs illuminated on EATC module). • Compare the airflow from the driver seat cushion and compare it to the airflow from the passenger seat cushion. • **Is the airflow exhausting from the driver seat cushion comparable to the airflow exhausting from the passenger seat cushion?**	**Yes** GO to AA14 . **No** GO to AA6 .
AA6 CHECK THE CUSHION BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER	
• Key in OFF position. • Inspect the blower of the cushion TED assembly for an obstruction or for a restricted filter. • **Is the blower obstructed or the filter restricted?**	**Yes** REMOVE the obstruction or INSTALL a new filter. REPEAT the self-test. CLEAR the DTCs. **No** GO to AA7 .
AA7 CHECK THE CUSHION FAN OPERATION	
• Key in ON position. • With the engine running, set both front seats to HIGH COOL (3 LEDs illuminated on EATC module). • Inspect the cushion blower for operation. • **Does the cushion blower operate?**	**Yes** GO to AA14 . **No** GO to AA8 .
AA8 CHECK THE BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. • Disconnect driver seat side air bag C3051 and passenger seat side air bag C3052. • Disconnect: CCSM C3265c. • Disconnect: Cushion TED C3035. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the resistance between CCSM C3265c-11, circuit CHS03 (GN/BN), harness side and cushion TED C3035-7, circuit CHS03 (GN/BN), harness side.  N0044852 • **Is the resistance less than 5 ohms?**	**Yes** GO to AA9 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AA9 CHECK THE BLOWER CIRCUIT CHS03 (GN/BN) FOR A	

SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between CCSM C3265c-15, circuit CHS03 (GN/BN), harness side and ground.  N0044853 • **Is voltage greater than 1 volt?**	**Yes** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to AA10 .
AA10 CHECK THE BLOWER CIRCUIT CHS13 (VT/BN) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between CCSM C3265c-16, circuit CHS13 (VT/BN), harness side and ground.  N0044846 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AA11 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AA11 CHECK THE BLOWER CIRCUITS CHS13 (VT/BN) AND CHS03 (GN/BN) FOR AN OPEN	
• Measure the resistance between CCSM C3265c-16, circuit CHS13 (VT/BN), harness side and cushion TED C3035-2, circuit CHS13 (VT/BN), harness side; and between CCSM C3265c-15, circuit CHS03 (GN/BN), harness side and cushion TED C3035-4, circuit CHS03 (GN/BN), harness side.	**Yes** GO to AA12 . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

 N0044854 • **Are the resistances less than 5 ohms?**	DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AA12 CHECK THE BLOWER RESISTANCE	
• **CAUTION: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between cushion TED C3035 pin 2 and pin 4, component side.  N0042881 • **Is the resistance between 6,000 ohms and 9,000 ohms?**	**Yes** GO to AA13 . **No** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AA13 CHECK THE BLOWER SPEED CONTROL RESISTANCE	
• **CAUTION: The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between cushion TED C3035 pin 7 and pin 4, component side.	**Yes** GO to AA14 . **No** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety

 N0042893 • **Is the resistance between 290K ohms and 420K ohms?**	belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AA14 CHECK THE TED INSTALLATION AND FOR CRUSHED SEAT CUSHION	

• Key in OFF position.
• Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
• Remove the seat. Refer to Seat — Front, 40 Percent in this section.
• Remove the seat cushion trim cover. Refer to Seat Cushion Cover — Front, 40 Percent in this section.
• Inspect the seat cushion for the following:
  ▪ Is the TED correctly installed?
  ▪ Is the seat cushion foam pad crushed or restricted?
  ▪ Is the climate controlled seat manifold crushed or restricted?
• **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**
	Yes
	CONNECT the battery ground cable.
	
	INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs.
	
	DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050.
	
	CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.
	
	REPOWER the SRS. REFER to Section 501-20B .
	
	No
	CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs.
	
	DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050.

	CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test AB: DTC B272A — Passenger Cushion Over-Temp Detected

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the climate controlled seat module (CCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB08 (VT/RD) into CCSM C3265a pins E and F. If power is disconnected from either pin E or F of CCSM C3265a with the power connection remaining on the other circuit, both seats will remain operational because the power feed circuits are connected internally in the CCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

Possible Causes

A passenger seat cushion over-temp fault can be caused by:

- wiring, terminals or connectors.
- restricted cushion TED filter.
- crushed or restricted cushion foam pad.
- crushed or restricted climate controlled seat manifold.
- a faulted cushion TED assembly.
- a faulted CCSM.

PINPOINT TEST AB: DTC B272A — PASSENGER CUSHION OVER-TEMP DETECTED

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take

AB1 CHECK THE CCSM FOR ON-DEMAND DTCS	
• Enter the following diagnostic mode on the diagnostic tool: Climate Controlled Seat Module (CCSM) Self Test/Retrieve DTCs. • **Was DTC B272A retrieved during the on-demand self test?**	**Yes** GO to AB2 . **No** GO to AB4 .
AB2 CHECK THE TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect passenger seat safety belt buckle pretensioner C3050. • Disconnect passenger seat side air bag C3052. • Disconnect: CCSM C3265b. • Disconnect: Cushion TED C3040. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the resistance between CCSM C3265b-2, circuit VHS27 (WH/OG), harness side and ground and between CCSM C3265b-3, circuit RHS10 (BU/OG), harness side and ground.  N0042894 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to AB3 . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. If equipped, CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AB3 CHECK THE TED THERMISTOR	
• Measure the resistance between cushion TED C3040 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table. **Temperature** / **Resistance** 0-10°C (32-50°F) / 2782-1663 ohms 10-20°C (50-68°F) / 1837-1140 ohms 20-30°C (68-86°F) / 1260-806 ohms 30-40°C (86-104°F) / 893-570 ohms 40-50°C (104-122°F) / 630-428 ohms	**Yes** REPAIR the affected open circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. If equipped, CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new cushion TED. REFER to Seat

 N0042890 • **Is the resistance within the limits indicated?**	Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. If equipped, CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AB4 CONFIRM THE FAULT	
• Verify with the customer that the concern is the seat shuts OFF in HEAT mode. • **NOTE:** A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault. • Attempt to recreate the fault. Start the vehicle and set the passenger seat to HIGH HEAT for at least 15 minutes. • **Is the customer concern with the seat shutting OFF in HEAT mode or was the fault recreated?**	**Yes** GO to AB5 . **No** Fault not present. Fault may have been set due to a past failure or incorrect use of the climate controlled seat system by repeated switching between HEAT and COOL modes. REPEAT the self-test. CLEAR the DTCs.
AB5 CHECK OPERATION OF THE SEAT	
• Key in ON position. • With the engine running, set both front seats to HIGH COOL (3 LEDs illuminated on EATC module). • Compare the airflow from the passenger seat cushion and compare it to the airflow from the driver seat cushion. • **Is the airflow exhausting from the passenger seat cushion comparable to the airflow exhausting from the driver seat cushion?**	**Yes** GO to AB14 . **No** GO to AB6 .
AB6 CHECK THE CUSHION BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER	
• Key in OFF position. • Inspect the blower of the cushion TED assembly for an obstruction or for a restricted filter. • **Is the blower obstructed or the filter restricted?**	**Yes** REMOVE the obstruction or INSTALL a new filter. REPEAT the self-test. CLEAR the DTCs. **No** GO to AB7 .
AB7 CHECK THE CUSHION FAN OPERATION	
• Key in ON position. • With the engine running, set both front seats to HIGH COOL (3 LEDs illuminated on EATC module). • Inspect the cushion blower for operation. • **Does the cushion blower operate?**	**Yes** GO to AB14 . **No** GO to AB8 .
AB8 CHECK THE BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN	
• Key in OFF position.	**Yes**

• Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect passenger seat safety belt buckle pretensioner C3050. • Disconnect passenger seat side air bag C3052. • Disconnect: CCSM C3265c. • Disconnect: Cushion TED C3040. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the resistance between CCSM C3265c-3, circuit RHS08 (VT/WH), harness side and cushion TED C3040-7, circuit RHS08 (VT/WH), harness side.  N0044844 • **Is the resistance less than 5 ohms?**	GO to AB9 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AB9 CHECK THE BLOWER CIRCUIT CHS08 (BN/YE) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between CCSM C3265c-7, circuit CHS08 (BN/YE), harness side and ground.  N0044855 • **Is voltage greater than 1 volt?**	**Yes** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to AB10 .
AB10 CHECK THE BLOWER CIRCUIT CHS14 (GN) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between CCSM C3265c-8, circuit CHS14 (GN), harness side and ground.	**Yes** GO to AB11 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT

 N0044848 • **Is the resistance greater than 10,000 ohms?**	passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AB11 CHECK THE BLOWER CIRCUITS CHS14 (GN) AND CHS08 (BN/YE) FOR AN OPEN	
• Measure the resistance between CCSM C3265c-8, circuit CHS14 (GN), harness side and cushion TED C3040-2, circuit CHS14 (GN), harness side; and between CCSM C3265c-7, circuit CHS08 (BN/YE), harness side and cushion TED C3040-4, circuit CHS08 (BN/YE), harness side.  N0044856 • **Are the resistances less than 5 ohms?**	**Yes** GO to AB12 . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AB12 CHECK THE BLOWER RESISTANCE	
• **CAUTION: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between cushion TED C3040 pin 2 and pin 4, component side.  N0042881 • **Is the resistance between 6,000 ohms and 9,000 ohms?**	**Yes** GO to AB13 . **No** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AB13 CHECK THE BLOWER SPEED CONTROL RESISTANCE	
• **CAUTION: The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect**	**Yes** GO to AB14 . **No** INSTALL a new cushion

identification of components that are not faulty. • Measure the resistance between cushion TED C3040 pin 7 and pin 4, component side.  N0042893 • **Is the resistance between 290K ohms and 420K ohms?**	TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AB14 CHECK THE TED INSTALLATION AND FOR CRUSHED SEAT CUSHION	

• Key in OFF position.
• Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
• Remove the seat. Refer to Seat — Front, 40 Percent in this section.
• Remove the seat cushion trim cover. Refer to Seat Cushion Cover — Front, 40 Percent in this section.
• Inspect the seat cushion for the following:
  ▪ Is the TED correctly installed?
  ▪ Is the seat cushion foam pad crushed or restricted?
  ▪ Is the climate controlled seat manifold crushed or restricted?
• **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**
	Yes
	CONNECT the battery ground cable.
	
	INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs.
	
	DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.
	
	REPOWER the SRS. REFER to Section 501-20B .
	
	No
	CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs.
	
	DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.
	
	REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test AC: DTC B272B — Passenger Back Over-Temp Detected

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the climate controlled seat module (CCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB08 (VT/RD) into CCSM C3265a pins E and F. If power is disconnected from either pin E or F of CCSM C3265a with the power connection remaining on the other circuit, both seats will remain operational because the power feed circuits are connected internally in the CCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

Possible Causes

A driver seat backrest over-temp fault can be caused by:

- wiring, terminals or connectors.
- restricted backrest TED filter.
- crushed or restricted backrest foam pad.
- crushed or restricted climate controlled seat manifold.
- a faulted backrest TED assembly.
- a faulted CCSM.

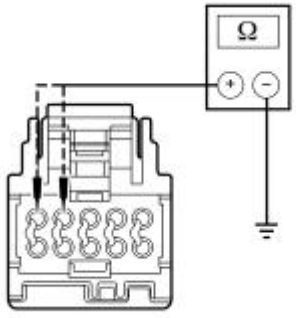
PINPOINT TEST AC: DTC B272B — PASSENGER BACK OVER-TEMP DETECTED

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AC1 CHECK THE CCSM FOR ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Climate Controlled Seat Module (CCSM) Self Test/Retrieve DTCs. • **Was DTC B2730 retrieved during the on-demand self test?**	**Yes** GO to AC2 . **No** GO to AC4 .
AC2 CHECK THE TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System	**Yes** GO to AC3 .

(SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
- Disconnect passenger seat safety belt buckle pretensioner C3050.
- Disconnect passenger seat side air bag C3052.
- Disconnect: CCSM C3265b.
- Disconnect: Backrest TED C3039 (10-Way Power Seat) or C3316 (6-Way Power Seat).
- **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.**
- Connect the battery ground cable.
- Measure the resistance between CCSM C3265b-4, circuit VHS36 (YE/BU), harness side and ground and between CCSM C3265b-5, circuit RHS20 (GN/BU), harness side and ground.



N0042899

- **Are the resistances greater than 10,000 ohms?**

No
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050.

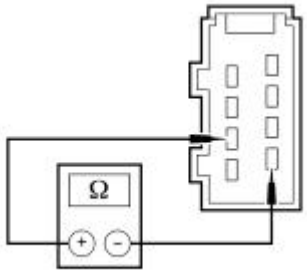
CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

AC3 CHECK THE TED THERMISTOR

- Measure the resistance between backrest TED C3039 (10-way power seat) or C3316 (6-way power seat) pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2782-1663 ohms
10-20°C (50-68°F)	1837-1140 ohms
20-30°C (68-86°F)	1260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms



N0053767

- **Is the resistance within the limits indicated?**

Yes
REPAIR the affected open circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050.

CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

No
INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT

	driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AC4 CONFIRM THE FAULT • Verify with the customer that the concern is the seat shuts OFF in HEAT mode. • **NOTE:** A crushed seat backrest foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault. • Attempt to recreate the fault. Start the vehicle and set the front passenger seat to HIGH HEAT for at least 15 minutes. • **Is the customer concern with the seat shutting OFF in HEAT mode or was the fault recreated?**	**Yes** GO to AC5 . **No** Fault not present. Fault may have been set due to a past failure or incorrect use of the climate controlled seat system by repeated switching between HEAT and COOL modes. REPEAT the self-test. CLEAR the DTCs.
AC5 CHECK OPERATION OF THE SEAT • Key in ON position. • With the engine running, set both front seats to HIGH COOL (3 LEDs illuminated on EATC module). • Compare the airflow from the front passenger seat backrest and compare it to the airflow from the driver seat backrest. • **Is the airflow exhausting from the front passenger seat backrest comparable to the airflow exhausting from the driver seat backrest?**	**Yes** GO to AC14 . **No** GO to AC6 .
AC6 CHECK THE BACKREST BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER • Key in OFF position. • Inspect the blower of the backrest TED assembly for an obstruction or for a restricted filter. • **Is the blower obstructed or the filter restricted?**	**Yes** REMOVE the obstruction or INSTALL a new filter. REPEAT the self-test. CLEAR the DTCs. **No** GO to AC7 .
AC7 CHECK THE BACKREST FAN OPERATION • Key in ON position. • With the engine running, set both front seats to HIGH COOL (3 LEDs illuminated on EATC module). • Inspect the backrest blower for operation. • **Does the backrest blower operate?**	**Yes** GO to AC14 . **No** GO to AC8 .
AC8 CHECK THE BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN • Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General	**Yes** GO to AC9 .

Procedures portion of Section 501-20B . • Disconnect passenger seat safety belt buckle pretensioner C3050. • Disconnect passenger seat side air bag C3052. • Disconnect: CCSM C3265c. • Disconnect: Backrest TED C3039 (10-Way Power Seat) or C3316 (6-Way Power Seat). • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • For 10-way power seat, measure the resistance between CCSM C3265c-4, circuit CHS09 (GY), harness side and backrest TED C3039-7, circuit CHS04 (YE/GY), harness side.  N0053808 • For 6-way power seat, measure the resistance between CCSM C3265c-4, circuit CHS09 (GY), harness side and backrest TED C3316-7, circuit CHS09 (GY), harness side. • **Is the resistance less than 5 ohms?**	**No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AC9 CHECK THE BLOWER CIRCUIT CHS08 (BN/YE) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between CCSM C3265c-7, circuit CHS08 (BN/YE), harness side and ground.  N0044855 • **Is voltage greater than 1 volt?**	**Yes** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to AC10 .
AC10 CHECK THE BLOWER CIRCUIT CHS14 (GN) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between CCSM C3265c-8, circuit CHS14 (GN), harness side and ground.	**Yes** GO to AC11 .

 N0044848 • **Is the resistance greater than 10,000 ohms?**	**No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. If equipped, CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AC11 CHECK THE BLOWER CIRCUITS CHS14 (GN) AND CHS08 (BN/YE) FOR AN OPEN	
• For 10-way power seat, measure the resistance between CCSM C3265c-8, circuit CHS14 (GN), harness side and backrest TED C3039-2, circuit CHS13 (VT/BN), harness side; and between CCSM C3265c-7, circuit CHS08 (BN/YE), harness side and backrest TED C3039-4, circuit CHS03 (GN/BN), harness side.  N0053809 • For 6-way power seat, measure the resistance between CCSM C3265c-8, circuit CHS14 (GN), harness side and backrest TED C3316-2, circuit CHS14 (GN), harness side; and between CCSM C3265c-7, circuit CHS08 (BN/YE), harness side and backrest TED C3316-4, circuit CHS08 (BN/YE), harness side. • **Are the resistances less than 5 ohms?**	**Yes** GO to AC12 . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AC12 CHECK THE BLOWER RESISTANCE	
• **CAUTION: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between backrest TED C3039 (10-way power seat) or C3316 (6-way power seat) pin 2 and pin 4, component side.	**Yes** GO to AC13 . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery

 N0053768 • **Is the resistance between 6,000 ohms and 9,000 ohms?**	ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AC13 CHECK THE BLOWER SPEED CONTROL RESISTANCE	
• **CAUTION: The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between backrest TED C3039 (10-way power seat) or C3316 (6-way power seat) pin 7 and pin 4, component side.  N0054028 • **Is the resistance between 290K ohms and 420K ohms?**	**Yes** GO to AC14 . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AC14 CHECK THE TED INSTALLATION AND FOR CRUSHED SEAT BACKREST	

• Key in OFF position.
• Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
• Remove the seat. Refer to Seat — Front, 40 Percent in this section.
• Remove the seat backrest trim cover. Refer to Seat Backrest Cover — Front, 40 Percent in this section.
• Inspect the seat backrest for the following:
  ▪ Is the TED correctly installed?
  ▪ Is the seat backrest foam pad crushed or restricted?
  ▪ Is the climate controlled seat manifold crushed or restricted?
• **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**
	Yes
	CONNECT the battery ground cable.
	
	INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs.
	
	DISCONNECT the battery ground cable. CONNECT driver seat safety belt

	buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** CORRECTLY install the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test AD: DTC B272C — Driver Differential Temperature Fault

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the climate controlled seat module (CCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB08 (VT/RD) into CCSM C3265a pins E and F. If power is disconnected from either pin E or F of CCSM C3265a with the power connection remaining on the other circuit, both seats will remain operational because the power feed circuits are connected internally in the CCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver

and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

A differential fault occurs when the cushion and backrest TEDs on an affected seat are reporting very different temperatures to the CCSM. This may result from an airflow restriction or a circuit fault of either TED area. If a TED and manifold is clear of obstruction and is operational, the other TED and circuitry on the seat should be checked. It is important to note that a TED with a higher temperature may be operating correctly and not the area of concern. The other TED may be indicating a much lower temperature, causing the DTC to set.

Possible Causes

A driver differential temperature fault can be caused by:

- wiring, terminals or connectors.
- restricted cushion or backrest TED filter.
- crushed or restricted cushion or backrest foam pad.
- crushed or restricted cushion or backrest climate controlled seat manifold.
- a faulted cushion or backrest TED assembly.
- a faulted CCSM.

PINPOINT TEST AD: DTC B272C — DRIVER DIFFERENTIAL TEMPERATURE FAULT

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AD1 CHECK THE CCSM FOR ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Climate Controlled Seat Module (CCSM) Self Test/Retrieve DTCs. • **Was DTC B2729 or B2730 retrieved during the on-demand self test or as a continuous DTC?**	**Yes** For DTC B2729, Go To Pinpoint Test AA . For DTC B2730, Go To Pinpoint Test AF . **No** GO to AD2 .
AD2 MONITOR THE CCSM TED TEMPERATURE PIDs	
• Enter the following diagnostic mode on the diagnostic tool: Datalogger/CCSM PIDs:. ▪ Passenger Cushion Thermal Electric Device (TED) Temperature ▪ Passenger Back Thermal Electric Device (TED) Temperature ▪ Cushion Thermal Electric Device (TED) Temperature ▪ Back Thermal Electric Device (TED) Temperature • **CAUTION: Make sure the temperature of the climate controlled seats has stabilized before monitoring the PIDs.** • Monitor the TED temperature PIDs with the climate controlled seats OFF. Compare the PID values of the driver seat to those	**Yes** GO to AD3 . **No** If the driver seat cushion PID value varies 10°C (18° F) or more from ambient temperature, GO to AD15 . If the driver seat backrest PID value varies 10°C (18° F) or more from ambient

of the front passenger seat, this can help identify if there is a concern with the driver seat cushion or backrest PID value readings. • **Are both driver seat TED temperature PID values within 10°C (18°F) of the ambient temperature?**	temperature, GO to AD30 .
AD3 CONFIRM THE FAULT IS IN THE SEAT CUSHION OR THE BACKREST	
• Key in OFF position. • Key in ON position. • **NOTE:** A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault. • After cycling the ignition switch and with the engine running, set the driver seat to HIGH HEAT (3 LEDs illuminated on EATC module). Allow the seat to heat for at least 15 minutes while monitoring the TED temperature PIDs of the driver seat. • **Do the driver seat cushion or backrest PID values vary more than 10°C (18°F)?**	**Yes** If the driver seat cushion PID value is 10°C (18°F) hotter than the backrest PID value, GO to AD4 . If the driver seat backrest PID value is 10°C (18°F) hotter than the cushion PID value, GO to AD19 . **No** Fault is currently not present. INSPECT for crushed seat cushion or backrest foam pad or climate controlled seat cushion or backrest manifold. CHECK for an intermittent wiring fault. REPAIR as needed. REPEAT the self-test. CLEAR the DTCs.
AD4 CHECK THE TED INSTALLATION AND FOR A CRUSHED SEAT CUSHION	

• Key in OFF position.
• Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
• Remove the seat. Refer to Seat — Front, 40 Percent in this section.
• Remove the seat cushion trim cover. Refer to Seat Cushion Cover — Front, 40 Percent in this section.
• Inspect the seat cushion for the following:
  ▪ Is the cushion blower obstructed?
  ▪ Is the blower filter restricted or plugged?
  ▪ Is the TED correctly installed?
  ▪ Is the seat cushion foam pad crushed or restricted?
  ▪ Is the climate controlled seat manifold crushed or restricted?
• **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**
	Yes
	GO to AD5 .
	
	No
	CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs.
	
	REPOWER the SRS. REFER to Section 501-20B .

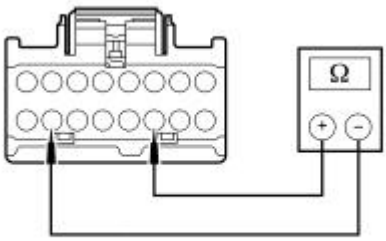
AD5 CHECK BACKREST TED CIRCUIT RHS01 (WH/VT) FOR SHORT TO VOLTAGE	
• Disconnect: CCSM C3265a. • **NOTE:** Do not connect the safety belt buckle pretensioner or seat side air bag electrical connectors at this time. • Position the driver seat in the vehicle and connect the seat-to-floor connectors. • Connect the battery ground cable. • Key in ON position. • Measure the voltage between CCSM C3265a-K, circuit RHS01 (WH/VT), harness side and ground.	**Yes** GO to AD6 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery

 N0044951 • **Is the voltage less than 0.5 volt?**	ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD6 CHECK BACKREST TED CIRCUIT CHS01 (GY/VT) FOR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between CCSM C3265a-J, circuit CHS01 (GY/VT), harness side and ground.  N0042910 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AD7 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD7 CHECK RESISTANCE OF THE BACKREST TED AND WIRING	
• Measure the resistance between CCSM C3265a-J, circuit CHS01 (GY/VT), harness side and CCSM C3265a-K, circuit RHS01 (WH/VT), harness side.  N0042876 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** GO to AD9 . **No** GO to AD8 .
AD8 CHECK RESISTANCE OF THE BACKREST TED	
	Yes

• Disconnect: Backrest TED C3034. • Measure the resistance between backrest TED C3034 pin 1 and pin 3, component side.  N0053766 • **Is the resistance between 0.9 and 10 ohms?**	REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. If equipped, CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD9 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: CCSM C3265c. • Key in ON position. • Measure the voltage between CCSM C3265c-16, circuit CHS13 (VT/BN), harness side and ground and between CCSM C3265c-11, circuit CHS03 (GN/BN), harness side and ground.	**Yes** GO to AD10 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety

 N0044857 • **Are the voltages less than one volt?**	belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD10 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND • Key in OFF position. • Measure the resistance between CCSM C3265c-16, circuit CHS13 (VT/BN), harness side and ground and between CCSM C3265c-11, circuit CHS03 (GN/BN), harness side and ground.  N0044858 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to AD11 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD11 CHECK THE BLOWER AND WIRING • **CAUTION: The ohmmeter must be connected with the positive lead to CCSM C3265c-16, circuit CHS13 (VT/BN) and the negative lead to CCSM C3265c-15, circuit CHS03 (GN/BN) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between CCSM C3265c-16, circuit CHS13 (VT/BN), harness side and CCSM C3265c-15, circuit CHS03 (GN/BN), harness side.  N0044850	**Yes** GO to AD13 . **No** GO to AD12 .

• **Is the resistance between 6,000 ohms and 9,000 ohms?**	
AD12 CHECK THE BLOWER	
• Disconnect: Cushion TED C3035. • **CAUTION: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between cushion TED C3035 pin 2 and pin 4, component side.  N0042881 • **Is the resistance between 6,000 ohms and 9,000 ohms?**	**Yes** REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD13 CHECK BLOWER SPEED CONTROL AND CIRCUIT	
• **CAUTION: The ohmmeter must be connected with the positive lead to C3265c-11, circuit CHS03 (GN/BN), harness side and the negative lead to C3265c-15, circuit CHS03 (GN/BN), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between CCSM C3265c-11, circuit CHS03 (GN/BN) harness side and CCSM C3265c-15, circuit CHS03 (GN/BN), harness side.	**Yes** GO to AD15 . **No** GO to AD14 .



N0044859

- **Is the resistance between 290K ohms and 420K ohms?**

AD14 CHECK THE BLOWER SPEED CONTROL	
• Disconnect: Cushion TED C3035. • **CAUTION: The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between cushion TED C3035 pin 7 and pin 4, component side.  N0054029 • **Is the resistance between 290K ohms and 420K ohms?**	**Yes** REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD15 CHECK THERMISTOR CIRCUIT FOR A SHORT TO	

VOLTAGE	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. • Disconnect driver seat side air bag C3051 and passenger seat side air bag C3052. • Disconnect: CCSM C3265b. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Key in ON position. • Measure the voltage between CCSM C3265b-7, circuit VHS26 (VT), harness side and ground.  N0042906 • **Is the voltage less than 0.5 volt?**	**Yes** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to AD16 .
AD16 CHECK THERMISTOR CIRCUIT FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between CCSM C3265b-7, circuit VHS26 (VT), harness side and ground.  N0042907 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AD17 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD17 CHECK THE THERMISTOR AND WIRING	
• Measure the resistance between CCSM C3265b-7, circuit VHS26 (VT), harness side and CCSM C3265b-8, circuit RHS05 (YE/VT), harness side. Note the ambient temperature	**Yes** INSTALL a new CCSM and CARRY OUT

and refer to the following table. **Temperature** / **Resistance** 0-10°C (32-50°F) — 2782-1663 ohms 10-20°C (50-68°F) — 1837-1140 ohms 20-30°C (68-86°F) — 1260-806 ohms 30-40°C (86-104°F) — 893-570 ohms 40-50°C (104-122°F) — 630-428 ohms  N0042908 • **Is the resistance within the limits indicated?**	programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to AD18 .
AD18 CHECK THE THERMISTOR	
• Disconnect: Cushion TED C3035. • Measure the resistance between cushion TED pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table. **Temperature** / **Resistance** 0-10°C (32-50°F) — 2782-1663 ohms 10-20°C (50-68°F) — 1837-1140 ohms 20-30°C (68-86°F) — 1260-806 ohms 30-40°C (86-104°F) — 893-570 ohms 40-50°C (104-122°F) — 630-428 ohms  N0042890 • **Is the resistance within the limits indicated?**	**Yes** REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049

	and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD19 CHECK THE TED INSTALLATION AND FOR A CRUSHED SEAT BACKREST	

• Key in OFF position.
• Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
• Remove the seat. Refer to Seat — Front, 40 Percent in this section.
• Remove the seat backrest trim cover. Refer to Seat Backrest Cover — Front, 40 Percent in this section.
• Inspect the seat backrest for the following:
  ▪ Is the backrest blower obstructed?
  ▪ Is the blower filter restricted or plugged?
  ▪ Is the TED correctly installed?
  ▪ Is the seat backrest foam pad crushed or restricted?
  ▪ Is the climate controlled seat manifold crushed or restricted?
• **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**
	Yes
	GO to AD20 .
	
	No
	CORRECTLY install the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs.
	
	REPOWER the SRS. REFER to Section 501-20B .

AD20 CHECK THE CUSHION TED CIRCUIT RHS02 (BU/OG) FOR SHORT TO VOLTAGE	
• Disconnect: CCSM C3265a. • **NOTE:** Do not connect the safety belt buckle pretensioner or seat side air bag electrical connectors at this time. • Position the driver seat in the vehicle and connect the seat-to-floor connectors. • Connect the battery ground cable. • Key in ON position. • Measure the voltage between CCSM C3265a-H, circuit RHS02 (BU/OG), harness side and ground.  N0044952 • **Is the voltage less than 0.5 volt?**	**Yes** GO to AD21 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD21 CHECK THE CUSHION TED CIRCUIT CHS02 (YE/BU) FOR SHORT TO GROUND	
• Key in OFF position.	**Yes**

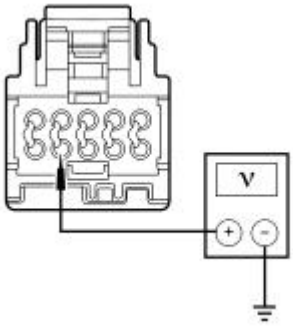
• Measure the resistance between CCSM C3265a-G, circuit CHS02 (YE/BU), harness side and ground.  N0044764 • **Is the resistance greater than 10,000 ohms?**	GO to AD22 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD22 CHECK RESISTANCE OF THE CUSHION TED AND WIRING	
• Measure the resistance between CCSM C3265a-G circuit CHS02 (YE/BU), harness side and CCSM C3265a-H, circuit RHS02 (BU/OG), harness side.  N0042194 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** GO to AD24 . **No** GO to AD23 .
AD23 CHECK RESISTANCE OF THE CUSHION TED	
• Disconnect: Cushion TED C3035. • Measure the resistance between cushion TED C3035 pin 1 and pin 3, component side.  N0042874 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-

	20B . **No** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD24 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: CCSM C3265c. • Key in ON position. • Measure the voltage between CCSM C3265c-16, circuit CHS13 (VT/BN), harness side and ground and between CCSM C3265c-12, circuit CHS04 (YE/GN), harness side and ground.  N0044860 • **Are the voltages less than one volt?**	**Yes** GO to AD25 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD25 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between CCSM C3265c-16, circuit CHS13 (VT/BN), harness side and ground and between CCSM C3265c-12, circuit CHS04 (YE/GN), harness side and ground.	**Yes** GO to AD26 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

 N0044861 • **Are the resistances greater than 10,000 ohms?**	DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD26 CHECK THE BLOWER AND WIRING	
• **CAUTION: The ohmmeter must be connected with the positive lead to CCSM C3265c-16, circuit CHS13 (VT/BN) and the negative lead to CCSM C3265c-15, circuit CHS03 (GN/BN) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between CCSM C3265c-16, circuit CHS13 (VT/BN), harness side and CCSM C3265c-15, circuit CHS03 (GN/BN), harness side.  N0044850 • **Is the resistance between 6,000 ohms and 9,000 ohms?**	**Yes** GO to AD28 . **No** GO to AD27 .
AD27 CHECK THE BLOWER	
• Disconnect: Backrest TED C3034. • **CAUTION: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between backrest TED C3034 pin 2 and pin 4, component side.	**Yes** REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS.

 N0053768 • **Is the resistance between 6,000 ohms and 9,000 ohms?**	REFER to Section 501-20B . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD28 CHECK BLOWER SPEED CONTROL AND CIRCUIT	
• **CAUTION: The ohmmeter must be connected with the positive lead to C3265c-12, circuit CHS04 (YE/GN), harness side and the negative lead to C3265c-15, circuit CHS03 (GN/BN), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between CCSM C3265c-12, circuit CHS04 (YE/GN) harness side and CCSM C3265c-15, circuit CHS03 (GN/BN), harness side.  N0044862 • **Is the resistance between 290K ohms and 420K ohms?**	**Yes** GO to AD30 . **No** GO to AD29 .
AD29 CHECK THE BLOWER SPEED CONTROL	
• Disconnect: Backrest TED C3034. • **CAUTION: The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between backrest TED C3034 pin 7 and pin 4, component side.	**Yes** REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt

 N0054028 • **Is the resistance between 290K ohms and 420K ohms?**	buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AD30 CHECK THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. • Disconnect driver seat side air bag C3051 and passenger seat side air bag C3052. • Disconnect: CCSM C3265b. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Key in ON position. • Measure the voltage between CCSM C3265b-9, circuit VHS35 (VT/OG), harness side and ground.	**Yes** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

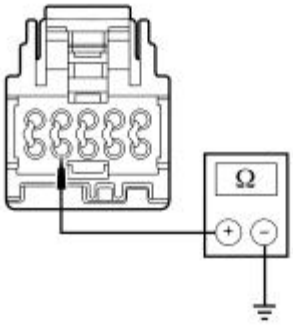


- **Is the voltage less than 0.5 volt?**

No
GO to AD31 .

AD31 CHECK THERMISTOR CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between CCSM C3265b-9, circuit VHS35 (VT/OG), harness side and ground.



- **Is the resistance greater than 10,000 volts?**

Yes
GO to AD32 .

No
REPAIR the circuit.
REPEAT the self-test.
CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050.

CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.

REPOWER the SRS.
REFER to Section 501-20B .

AD32 CHECK THE THERMISTOR AND WIRING

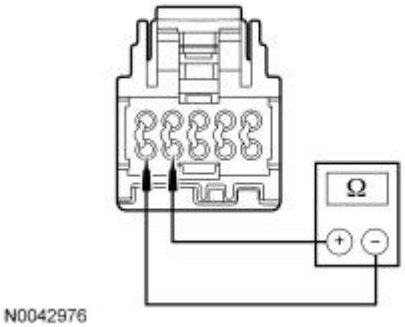
- Measure the resistance between CCSM C3265b-9, circuit VHS35 (VT/OG), harness side and CCSM C3265b-10, circuit RHS15 (GY/BN), harness side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2782-1663 ohms
10-20°C (50-68°F)	1837-1140 ohms
20-30°C (68-86°F)	1260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

Yes
INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section.
REPEAT the self-test.
CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050.

CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.



- **Is the resistance within the limits indicated?**

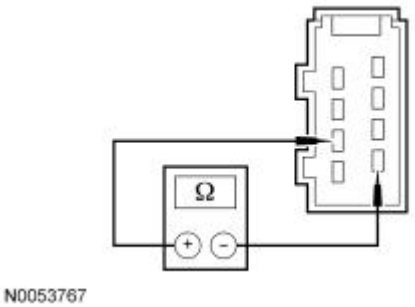
REPOWER the SRS. REFER to Section 501-20B .

No
GO to AD33 .

AD33 CHECK THE THERMISTOR

- Disconnect: Backrest TED C3034.
- Measure the resistance between backrest TED pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2782-1663 ohms
10-20°C (50-68°F)	1837-1140 ohms
20-30°C (68-86°F)	1260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms



- **Is the resistance within the limits indicated?**

Yes
REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050.

CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

No
INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050.

CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test AE: DTC B272D — Passenger Differential Temperature Fault

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the climate controlled seat module (CCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB08 (VT/RD) into CCSM C3265a pins E and F. If power is disconnected from either pin E or F of CCSM C3265a with the power connection remaining on the other circuit, both seats will remain operational because the power feed circuits are connected internally in the CCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

A differential fault occurs when the cushion and backrest TEDs on an affected seat are reporting very different temperatures to the CCSM. This may result from an airflow restriction or a circuit fault of either TED area. If a TED and manifold is clear of obstruction and is operational, the other TED and circuitry on the seat should be checked. It is important to note that a TED with a higher temperature may be operating correctly and not the area of concern. The other TED may be indicating a much lower temperature, causing the DTC to set.

Possible Causes

A driver differential temperature fault can be caused by:

- wiring, terminals or connectors.
- restricted cushion or backrest TED filter.
- crushed or restricted cushion or backrest foam pad.
- crushed or restricted cushion or backrest climate controlled seat manifold.
- a faulted cushion or backrest TED assembly.
- a faulted CCSM.

PINPOINT TEST AE: DTC B272D — PASSENGER DIFFERENTIAL TEMPERATURE FAULT

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AE1 CHECK THE CCSM FOR ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Climate Controlled Seat Module (CCSM) Self Test/Retrieve DTCs.	**Yes** For DTC B272A, Go To Pinpoint Test AB . For

• **Was DTC B272A or B272B retrieved during the on-demand self test or as a continuous DTC?**	DTC B272B, Go To Pinpoint Test AC . **No** GO to AE2 .
AE2 MONITOR THE CCSM TED TEMPERATURE PIDs	

• Enter the following diagnostic mode on the diagnostic tool: Datalogger/CCSM PIDs:.
  ▪ Passenger Cushion Thermal Electric Device (TED) Temperature
  ▪ Passenger Back Thermal Electric Device (TED) Temperature
  ▪ Cushion Thermal Electric Device (TED) Temperature
  ▪ Back Thermal Electric Device (TED) Temperature
• **CAUTION: Make sure the temperature of the climate controlled seats has stabilized before monitoring the PIDs.**
• Monitor the TED temperature PIDs with the climate controlled seats OFF. Compare the PID values of the front passenger seat to those of the driver seat, this can help identify if there is a concern with the front passenger seat cushion or backrest PID value readings.
• **Are both front passenger seat TED temperature PID values within 10°C (18°F) of the ambient temperature?**
	Yes
	GO to AE3 .
	
	No
	If the front passenger seat cushion PID value varies 10°C (18°F) or more from ambient temperature, GO to AE15 .
	
	If the front passenger seat backrest PID value varies 10°C (18°F) or more from ambient temperature, GO to AE30 .

AE3 CONFIRM THE FAULT IS IN THE SEAT CUSHION OR THE BACKREST	
• Key in OFF position. • Key in ON position. • **NOTE:** A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault. • After cycling the ignition switch and with the engine running, set the driver seat to HIGH HEAT (3 LEDs illuminated on EATC module). Allow the seat to heat for at least 15 minutes while monitoring the TED temperature PIDs of the driver seat. • **Do the front passenger seat cushion or backrest PID values vary more than 10°C (18°F)?**	**Yes** If the front passenger seat cushion PID value is 10°C (18°F) hotter than the backrest PID value, GO to AE4 . If the front passenger seat backrest PID value is 10°C (18°F) hotter than the cushion PID value, GO to AE19 . **No** Fault is currently not present. INSPECT for crushed seat cushion or backrest foam pad or climate controlled seat cushion or backrest manifold. CHECK for an intermittent wiring fault. REPAIR as needed. REPEAT the self-test. CLEAR the DTCs.
AE4 CHECK THE TED INSTALLATION AND FOR A CRUSHED SEAT CUSHION	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect passenger seat safety belt buckle pretensioner C3050. • Disconnect passenger seat side air bag C3052.	**Yes** GO to AE5 . **No** CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate

• **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.**
• Connect the battery ground cable.
• Remove the seat. Refer to Seat — Front, 40 Percent in this section.
• Remove the seat cushion trim cover. Refer to Seat Cushion Cover — Front, 40 Percent in this section.
• Inspect the seat cushion for the following:
  ■ Is the cushion blower obstructed?
  ■ Is the blower filter restricted or plugged?
  ■ Is the TED correctly installed?
  ■ Is the seat cushion foam pad crushed or restricted?
  ■ Is the climate controlled seat manifold crushed or restricted?
• **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**
	controlled seat manifold. REPEAT the self-test. CLEAR the DTCs.
	
	DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. If equipped, CONNECT passenger seat side air bag module C3052.
	
	REPOWER the SRS. REFER to Section 501-20B .

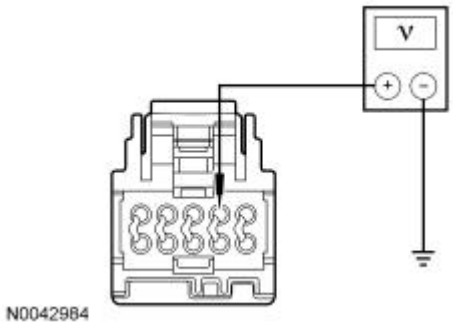
AE5 CHECK THE BACKREST TED CIRCUIT RHS06 (WH) FOR SHORT TO VOLTAGE	
• Disconnect: CCSM C3265a. • Position the front passenger seat in the vehicle and connect the seat-to-floor connectors. • Key in ON position. • Measure the voltage between CCSM C3265a-D, circuit RHS06 (WH), harness side and ground.  N0044950 • **Is the voltage less than 0.5 volt?**	**Yes** GO to AE6 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE6 CHECK THE BACKREST TED CIRCUIT CHS06 (BU/BN) FOR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between CCSM C3265a-C, circuit CHS06 (BU/BN), harness side and ground.  N0042988 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AE7 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE7 CHECK RESISTANCE OF THE BACKREST TED AND	

WIRING	
• Measure the resistance between CCSM C3265a-C, circuit CHS06 (BU/BN), harness side and CCSM C3265a-D, circuit RHS06 (WH), harness side.  N0042989 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** GO to AE9 . **No** GO to AE8 .
AE8 CHECK RESISTANCE OF THE BACKREST TED	
• Disconnect: Backrest TED C3039 (10-Way Power Seat) or C3316 (6-Way Power Seat). • Measure the resistance between backrest TED C3039 (10-way power seat) or C3316 (6-way power seat) pin 1 and pin 3, component side.  N0053766 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE9 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: CCSM C3265c. • Key in ON position. • Measure the voltage between CCSM C3265c-8, circuit CHS14 (GN), harness side and ground and between CCSM C3265c-3, circuit RHS08 (VT/WH), harness side and ground.	**Yes** GO to AE10 . **No** REPAIR the circuit.

 N0044863 • **Are the voltages less than one volt?**	REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE10 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between CCSM C3265c-8, circuit CHS14 (GN), harness side and ground and between CCSM C3265c-3, circuit RHS08 (VT/WH), harness side and ground.  N0044864 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to AE11 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE11 CHECK THE BLOWER AND WIRING	
• **CAUTION: The ohmmeter must be connected with the positive lead to CCSM C3265c-8, circuit CHS14 (GN) and the negative lead to CCSM C3265c-7, circuit CHS08 (BN/YE) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between CCSM C3265c-8, circuit CHS14 (GN), harness side and CCSM C3265c-7, circuit CHS08 (BN/YE), harness side.  N0044851 • **Is the resistance between 6,000 ohms and 9,000 ohms?**	**Yes** GO to AE13 . **No** GO to AE12 .
AE12 CHECK THE BLOWER	
• Disconnect: Cushion TED C3040.	**Yes**

• **CAUTION: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between cushion TED C3040 pin 2 and pin 4, component side.  N0042881 • **Is the resistance between 6,000 ohms and 9,000 ohms?**	REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE13 CHECK BLOWER SPEED CONTROL AND CIRCUIT	
• **CAUTION: The ohmmeter must be connected with the positive lead to C3265c-3, circuit RHS08 (VT/WH), harness side and the negative lead to C3265c-7, circuit CHS08 (BN/YE), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between CCSM C3265c-3, circuit RHS08 (VT/WH) harness side and CCSM C3265c-7, circuit CHS08 (BN/YE), harness side.  N0047113 • **Is the resistance between 290K ohms and 420K ohms?**	**Yes** GO to AE15 . **No** GO to AE14 .
AE14 CHECK THE BLOWER SPEED CONTROL	

• Disconnect: Cushion TED C3040. • **CAUTION: The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between cushion TED C3040 pin 7 and pin 4, component side.  N0054029 • **Is the resistance between 290K ohms and 420K ohms?**	**Yes** REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE15 CHECK THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect passenger seat safety belt buckle pretensioner C3050. • Disconnect passenger seat side air bag C3052. • Disconnect: CCSM C3265b. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Key in ON position. • Measure the voltage between CCSM C3265b-2, circuit VHS27 (WH/OG), harness side and ground.	**Yes** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. If equipped, CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to AE16 .

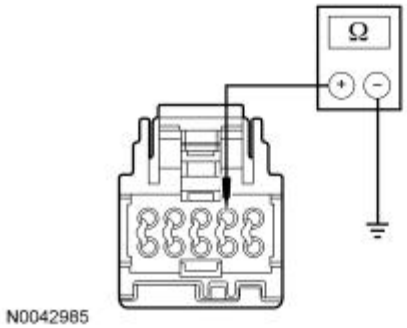


N0042984

- **Is the voltage less than 0.5 volt?**

AE16 CHECK THERMISTOR CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between CCSM C3265b-2, circuit VHS27 (WH/OG), harness side and ground.



N0042985

- **Is the resistance greater than 10,000 volts?**

Yes
GO to AE17 .

No
REPAIR the circuit.
REPEAT the self-test.
CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

AE17 CHECK THE THERMISTOR AND WIRING

- Measure the resistance between CCSM C3265b-2, circuit VHS27 (WH/OG), harness side and CCSM C3265b-3, circuit RHS10 (BU/OG), harness side. Note the ambient temperature and refer to the following table.

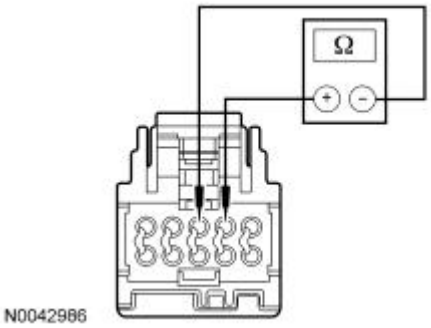
Temperature	Resistance
0-10°C (32-50°F)	2782-1663 ohms
10-20°C (50-68°F)	1837-1140 ohms
20-30°C (68-86°F)	1260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

Yes
INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section.
REPEAT the self-test.
CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052.

REPOWER the SRS. REFER to Section 501-20B .

No
GO to AE18 .



- **Is the resistance within the limits indicated?**

AE18 CHECK THE THERMISTOR	
• Disconnect: Cushion TED C3040. • Measure the resistance between cushion TED pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table. **Temperature** / **Resistance** 0-10°C (32-50°F) / 2782-1663 ohms 10-20°C (50-68°F) / 1837-1140 ohms 20-30°C (68-86°F) / 1260-806 ohms 30-40°C (86-104°F) / 893-570 ohms 40-50°C (104-122°F) / 630-428 ohms  N0042890 • **Is the resistance within the limits indicated?**	**Yes** REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE19 CHECK THE TED INSTALLATION AND FOR A CRUSHED SEAT BACKREST	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Remove the seat. Refer to Seat — Front, 40 Percent in this section. • Remove the seat backrest trim cover. Refer to Seat Backrest Cover — Front, 40 Percent in this section.	**Yes** GO to AE20 . **No** CORRECTLY install the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold.

• Inspect the seat backrest for the following:
  ▪ Is the backrest blower obstructed?
  ▪ Is the blower filter restricted or plugged?
  ▪ Is the TED correctly installed?
  ▪ Is the seat backrest foam pad crushed or restricted?
  ▪ Is the climate controlled seat manifold crushed or restricted?
• **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**
	CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs.
	
	REPOWER the SRS. REFER to Section 501-20B .

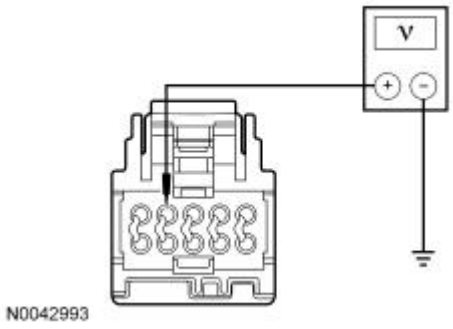
AE20 CHECK CUSHION TED CIRCUIT RHS07 (BU) FOR SHORT TO VOLTAGE	
• Disconnect: CCSM C3265a. • **NOTE:** Do not connect the safety belt buckle pretensioner or seat side air bag electrical connectors at this time. • Position the front passenger seat in the vehicle and connect the seat-to-floor connectors. • Connect the battery ground cable. • Key in ON position. • Measure the voltage between CCSM C3265a-B, circuit RHS07 (BU), harness side and ground.  N0044870 • **Is the voltage less than 0.5 volt?**	**Yes** GO to AE21 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE21 CHECK THE CUSHION TED CIRCUIT CHS07 (GY/BU) FOR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between CCSM C3265a-A, circuit CHS07 (GY/BU), harness side and ground.  N0042978 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AE22 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE22 CHECK RESISTANCE OF THE CUSHION TED AND WIRING	
• Measure the resistance between CCSM C3265a-A circuit CHS07 (GY/BU), harness side and CCSM C3265a-B, circuit RHS07 (BU), harness side.	**Yes** GO to AE24 . **No**

 N0042979 • **Is the resistance between 0.9 and 10 ohms?**	GO to AE23 .
AE23 CHECK RESISTANCE OF THE CUSHION TED	
• Disconnect: Cushion TED C3040. • Measure the resistance between cushion TED C3040 pin 1 and pin 3, component side.  N0042874 • **Is the resistance between 0.9 and 10 ohms?**	**Yes** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new cushion TED. REFER to Seat Cushion Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE24 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: CCSM C3265c. • Key in ON position. • Measure the voltage between CCSM C3265c-8, circuit CHS14 (GN), harness side and ground and between CCSM C3265c-4, circuit CHS09 (GY), harness side and ground.	**Yes** GO to AE25 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT

 N0044866 • **Are the voltages less than one volt?**	passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE25 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between CCSM C3265c-8, circuit CHS14 (GN), harness side and ground and between CCSM C3265c-4, circuit CHS09 (GY), harness side and ground.  N0044867 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to AE26 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. If equipped, CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE26 CHECK THE BLOWER AND WIRING	
• **CAUTION: The ohmmeter must be connected with the positive lead to CCSM C3265c-8, circuit CHS14 (GN) and the negative lead to CCSM C3265c-7, circuit CHS08 (BN/YE) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between CCSM C3265c-8, circuit CHS14 (GN), harness side and CCSM C3265c-7, circuit CHS08 (BN/YE), harness side.  N0044851 • **Is the resistance between 6,000 ohms and 9,000 ohms?**	**Yes** GO to AE28 . **No** GO to AE27 .
AE27 CHECK THE BLOWER	
• Disconnect: Backrest TED C3039 (10-Way Power Seat) or	**Yes**

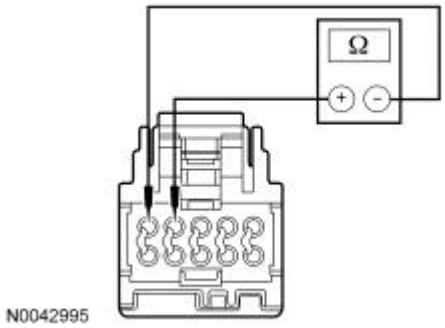
C3316 (6-Way Power Seat). • **CAUTION: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between backrest TED C3039 (10-way power seat) or C3316 (6-way power seat) pin 2 and pin 4, component side.  N0053768 • **Is the resistance between 6,000 ohms and 9,000 ohms?**	REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE28 CHECK BLOWER SPEED CONTROL AND CIRCUIT	
• **CAUTION: The ohmmeter must be connected with the positive lead to C3265c-4, circuit CHS09 (GY), harness side and the negative lead to C3265c-7, circuit CHS08 (BN/YE), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between CCSM C3265c-4, circuit CHS09 (GY) harness side and CCSM C3265c-7, circuit CHS08 (BN/YE), harness side.  N0044868 • **Is the resistance between 290K ohms and 420K ohms?**	**Yes** GO to AE30 . **No** GO to AE29 .
AE29 CHECK THE BLOWER SPEED CONTROL	

• Disconnect: Backrest TED C3039 (10-Way Power Seat) or C3316 (6-Way Power Seat). • **CAUTION: The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between backrest TED C3039 (10-way power seat) or C3316 (6-way power seat) pin 7 and pin 4, component side.  N0054028 • **Is the resistance between 290K ohms and 420K ohms?**	**Yes** REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE30 CHECK THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect passenger seat safety belt buckle pretensioner C3050. • Disconnect passenger seat side air bag C3052. • Disconnect: CCSM C3265b. • **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Key in ON position. • Measure the voltage between CCSM C3265b-4, circuit VHS36 (YE/BU), harness side and ground.	**Yes** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to AE31 .



- **Is the voltage less than 0.5 volt?**

AE31 CHECK THERMISTOR CIRCUIT FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between CCSM C3265b-4, circuit VHS36 (YE/BU), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AE32 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AE32 CHECK THE THERMISTOR AND WIRING	
• Measure the resistance between CCSM C3265b-4, circuit VHS36 (YE/BU), harness side and CCSM C3265b-5, circuit RHS20 (GN/BU), harness side. Note the ambient temperature and refer to the following table. **Temperature** / **Resistance** 0-10°C (32-50°F) / 2782-1663 ohms 10-20°C (50-68°F) / 1837-1140 ohms 20-30°C (68-86°F) / 1260-806 ohms 30-40°C (86-104°F) / 893-570 ohms 40-50°C (104-122°F) / 630-428 ohms	**Yes** INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to AE33 .



N0042995

- **Is the resistance within the limits indicated?**

AE33 CHECK THE THERMISTOR	
• Disconnect: Backrest TED C3039 (10-Way Power Seat) or C3316 (6-Way Power Seat). • Measure the resistance between backrest TED pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table. **Temperature / Resistance** 0-10°C (32-50°F) — 2782-1663 ohms 10-20°C (50-68°F) — 1837-1140 ohms 20-30°C (68-86°F) — 1260-806 ohms 30-40°C (86-104°F) — 893-570 ohms 40-50°C (104-122°F) — 630-428 ohms  N0053767 • **Is the resistance within the limits indicated?**	**Yes** REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT passenger seat safety belt buckle pretensioner C3050. CONNECT passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .

Pinpoint Test AF: DTC B2730 — Back Over-Temp Detected (Driver)

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the climate controlled seat module (CCSM) mounted to the bottom of the passenger seat cushion.

The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the CCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives power from battery junction box (BJB) fuse 8 (40A) feeding battery voltage on circuit SBB08 (VT/RD) into CCSM C3265a pins E and F. If power is disconnected from either pin E or F of CCSM C3265a with the power connection remaining on the other circuit, both seats will remain operational because the power feed circuits are connected internally in the CCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the CCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependant on the EATC seat switch settings.

Possible Causes

A driver seat backrest over-temp fault can be caused by:

- wiring, terminals or connectors.
- restricted backrest TED filter.
- crushed or restricted backrest foam pad.
- crushed or restricted climate controlled seat manifold.
- a faulted backrest TED assembly.
- a faulted CCSM.

PINPOINT TEST AF: DTC B2730 — BACK OVER-TEMP DETECTED (DRIVER)

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AF1 CHECK THE CCSM FOR ON-DEMAND DTCs	
• Enter the following diagnostic mode on the diagnostic tool: Climate Controlled Seat Module (CCSM) Self Test/Retrieve DTCs. • **Was DTC B2730 retrieved during the on-demand self test?**	**Yes** GO to AF2 . **No** GO to AF4 .
AF2 CHECK THE TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND	
• Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. • Disconnect driver seat side air bag C3051 and passenger seat side air bag C3052. • Disconnect: CCSM C3265b. • Disconnect: Backrest TED C3034.	**Yes** GO to AF3 . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt

• **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the resistance between CCSM C3265b-9, circuit VHS35 (VT/OG), harness side and ground and between CCSM C3265b-10, circuit RHS15 (GY/BN), harness side and ground.  N0042976 • **Are the resistances greater than 10,000 ohms?**	buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AF3 CHECK THE TED THERMISTOR	
• Measure the resistance between backrest TED C3034 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table. **Temperature** / **Resistance** 0-10°C (32-50°F) / 2782-1663 ohms 10-20°C (50-68°F) / 1837-1140 ohms 20-30°C (68-86°F) / 1260-806 ohms 30-40°C (86-104°F) / 893-570 ohms 40-50°C (104-122°F) / 630-428 ohms  N0053767 • **Is the resistance within the limits indicated?**	**Yes** REPAIR the affected open circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and

	passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AF4 CONFIRM THE FAULT • Verify with the customer that the concern is the seat shuts OFF in HEAT mode. • **NOTE:** A crushed seat backrest foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault. • Attempt to recreate the fault. Start the vehicle and set the driver seat to HIGH HEAT for at least 15 minutes. • **Is the customer concern with the seat shutting OFF in HEAT mode or was the fault recreated?**	**Yes** GO to AF5 . **No** Fault not present. Fault may have been set due to a past failure or incorrect use of the climate controlled seat system by repeated switching between HEAT and COOL modes. REPEAT the self-test. CLEAR the DTCs.
AF5 CHECK OPERATION OF THE SEAT • Key in ON position. • With the engine running, set both front seats to HIGH COOL (3 LEDs illuminated on EATC module). • Compare the airflow from the driver seat backrest and compare it to the airflow from the passenger seat backrest. • **Is the airflow exhausting from the driver seat backrest comparable to the airflow exhausting from the passenger seat backrest?**	**Yes** GO to AF14 . **No** GO to AF6 .
AF6 CHECK THE BACKREST BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER • Key in OFF position. • Inspect the blower of the backrest TED assembly for an obstruction or for a restricted filter. • **Is the blower obstructed or the filter restricted?**	**Yes** REMOVE the obstruction or INSTALL a new filter. REPEAT the self-test. CLEAR the DTCs. **No** GO to AF7 .
AF7 CHECK THE BACKREST FAN OPERATION • Key in ON position. • With the engine running, set both front seats to HIGH COOL (3 LEDs illuminated on EATC module). • Inspect the backrest blower for operation. • **Does the backrest blower operate?**	**Yes** GO to AF14 . **No** GO to AF8 .
AF8 CHECK THE BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN • Key in OFF position. • Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. • If equipped, disconnect driver seat side air bag C3051 and passenger seat side air bag C3052. • Disconnect: CCSM C3265c. • Disconnect: Backrest TED C3034.	**Yes** GO to AF9 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt

• **WARNING: Be sure that nobody is in the vehicle and that there is nothing blocking or set in front of any air bag module when the battery ground cable is connected.** • Connect the battery ground cable. • Measure the resistance between CCSM C3265c-12, circuit CHS04 (YE/GN), harness side and backrest TED C3034-7, circuit CHS04 (YE/GN), harness side.  N0053810 • **Is the resistance less than 5 ohms?**	buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AF9 CHECK THE BLOWER CIRCUIT CHS03 (GN/BN) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between CCSM C3265c-15, circuit CHS03 (GN/BN), harness side and ground.  N0044853 • **Is voltage greater than 1 volt?**	**Yes** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B . **No** GO to AF10 .
AF10 CHECK THE BLOWER CIRCUIT CHS13 (VT/BN) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between CCSM C3265c-16, circuit CHS13 (VT/BN), harness side and ground.	**Yes** GO to AF11 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety

 N0044846 • **Is the resistance greater than 10,000 ohms?**	belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AF11 CHECK THE BLOWER CIRCUITS CHS13 (VT/BN) AND CHS03 (GN/BN) FOR AN OPEN • Measure the resistance between CCSM C3265c-16, circuit CHS13 (VT/BN), harness side and backrest TED C3034-2, circuit CHS13 (VT/BN), harness side; and between CCSM C3265c-15, circuit CHS03 (GN/BN), harness side and backrest TED C3034-4, circuit CHS03 (GN/BN), harness side.  N0053811 • **Are the resistances less than 5 ohms?**	**Yes** GO to AF12 . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AF12 CHECK THE BLOWER RESISTANCE • **CAUTION: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between backrest TED C3034 pin 2 and pin 4, component side.  N0053768 • **Is the resistance between 6,000 ohms and 9,000 ohms?**	**Yes** GO to AF13 . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag

	module C3052. REPOWER the SRS. REFER to Section 501-20B .
AF13 CHECK THE BLOWER SPEED CONTROL RESISTANCE	
• **CAUTION: The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.** • Measure the resistance between backrest TED C3034 pin 7 and pin 4, component side.  N0054028 • **Is the resistance between 290K ohms and 420K ohms?**	**Yes** GO to AF14 . **No** INSTALL a new backrest TED. REFER to Seat Backrest Thermo-Electric Device in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat safety belt buckle pretensioner C3049 and passenger seat safety belt buckle pretensioner C3050. CONNECT driver seat side air bag module C3051 and passenger seat side air bag module C3052. REPOWER the SRS. REFER to Section 501-20B .
AF14 CHECK THE TED INSTALLATION AND FOR CRUSHED SEAT BACKREST	

• Key in OFF position.
• Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
• Remove the seat. Refer to Seat — Front, 40 Percent in this section.
• Remove the seat backrest trim cover. Refer to Seat Backrest Cover — Front, 40 Percent in this section.
• Inspect the seat backrest for the following:
  ▪ Is the TED correctly installed?
  ▪ Is the seat backrest foam pad crushed or restricted?
  ▪ Is the climate controlled seat manifold crushed or restricted?
• **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**
	Yes
	CONNECT the battery ground cable.
	
	INSTALL a new CCSM and CARRY OUT programmable module installation (PMI). REFER to Climate Controlled Seat Module in this section. REPEAT the self-test. CLEAR the DTCs.
	
	REPOWER the SRS. REFER to Section 501-20B .
	
	No
	CORRECTLY install the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold. CONNECT the battery ground cable. REPEAT the self-test. CLEAR the DTCs.

	REPOWER the SRS. REFER to Section 501-20B .

Seat — Front, 40 Percent

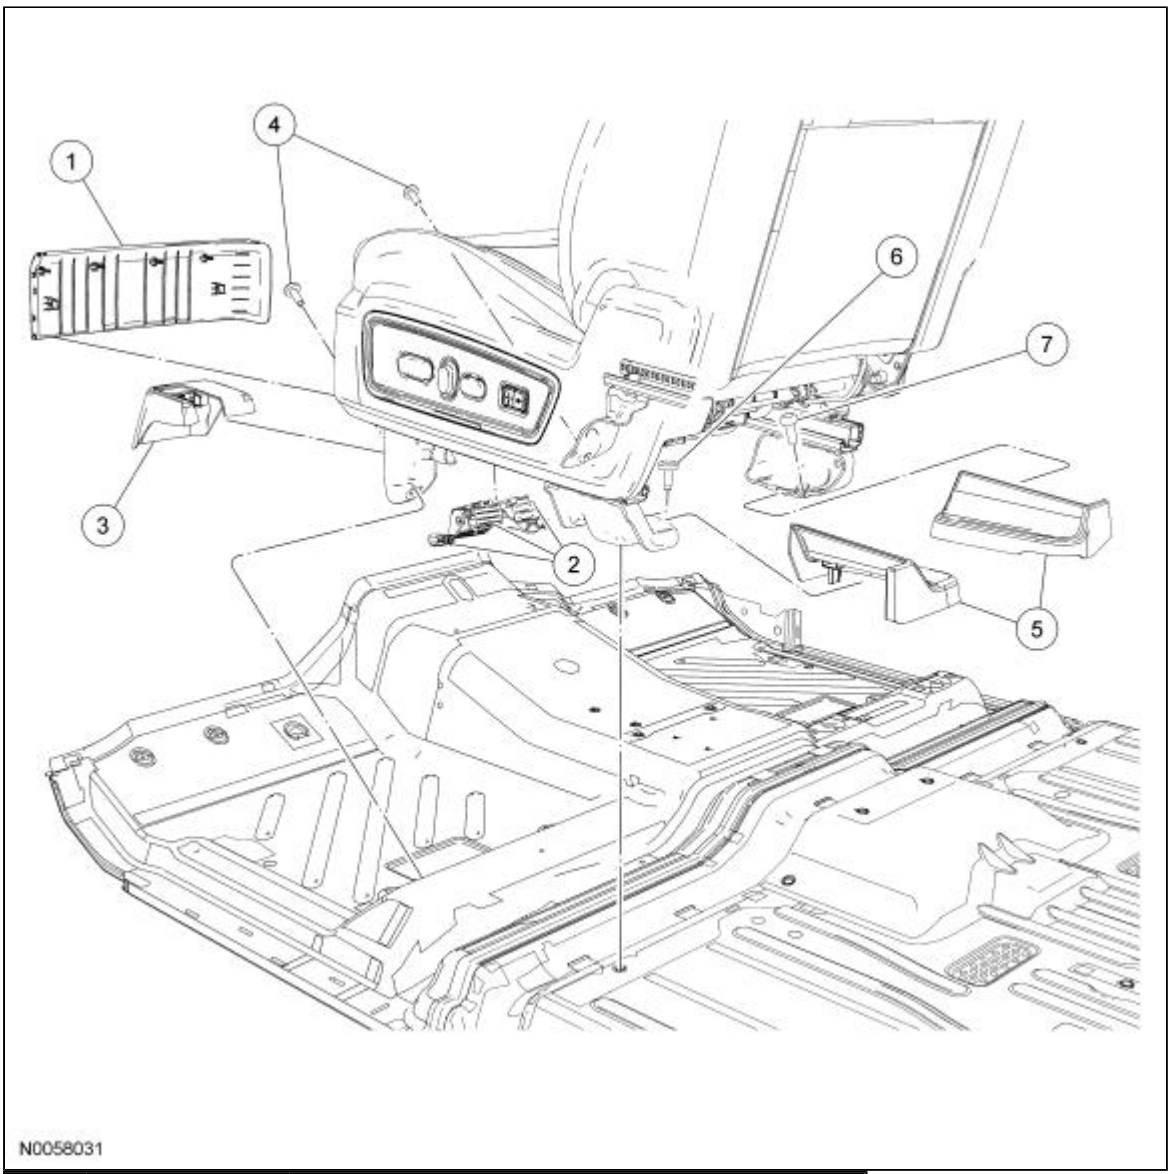
NOTE: Driver seat shown, passenger seat similar.

NOTE: For torque specifications and torque sequence, refer to the procedure steps.



Item	Part Number	Description
1	62184	Front seat cushion panel shield
2	—	Electrical connectors (part of 14A699)
3	618D49	Seat-to-floor front bolt cover
4	W708564	Seat-to-floor front bolts (2 required)
5	618D49	Seat-to-floor rear bolt covers (2 required)
6	W708564	Seat-to-floor rear outboard bolt
7	W710482	Seat-to-floor rear inboard bolt

Removal

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Position the seat to access all seat-to-floor fasteners.

2. Depower the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

3. Remove the 2 seat-to-floor rear bolt covers.

4. Remove the 2 seat-to-floor rear bolts.

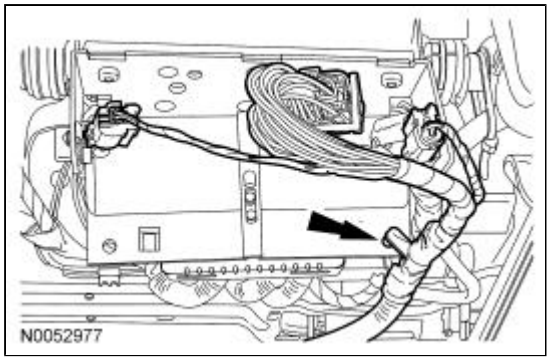
5. **CAUTION: Do not pull from the inboard side of the front seat cushion panel shield to avoid damaging it.**

   Remove the front seat cushion panel shield.
   - Release the upper retaining clips working from the outboard side and then release the lower retaining clips.

6. Remove the seat-to-floor front bolt cover.

7. Remove the 2 seat-to-floor front bolts.

8. Detach the pin-type retainer and vehicle wiring harness from the seat.



9. Disconnect the seat harness electrical connectors.

- Disconnect the safety belt buckle pretensioner electrical connector.
  - Slide the release button and separate the connector.
- Disconnect the side air bag electrical connector.
  - Slide the release button and separate the connector.
- Disconnect the seat harness electrical connector.
  - Release the locking tab and rotate the assurance lever fully to disengage the seat harness electrical connector.
  - Slightly tip the connector away and disconnect.
  - For memory seat, repeat the step and disconnect the other connector.

10. Remove the seat from the vehicle.

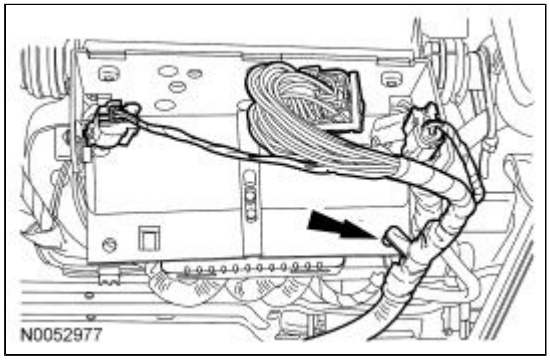
Installation

NOTE: The seat-to-floor bolts must be tightened in the sequence described in this procedure.

1. Position the seat in the vehicle.

2. Connect the electrical connectors.
   - Connect the seat harness electrical connector.
     - Make sure the electrical connector assurance lever is in the fully released position.
     - Tip the body harness connector into the seat connector and partially insert.
     - Rotate the assurance lever while pushing the connectors together until the handle is locked.
     - For memory seat, repeat the step and connect the other connector.
   - Connect the safety belt buckle pretensioner electrical connector.
     - Make sure the release is locked.
   - Connect the side air bag electrical connector.
     - Make sure the release is locked.

3. Install the wiring harness pin-type retainer.



4. Install the seat-to-floor front inboard bolt.
   - Tighten to 40 Nm (30 lb-ft).

5. Install the seat-to-floor front outboard bolt and bolt cover.
   - Tighten to 40 Nm (30 lb-ft).

6. Install the seat-to-floor rear inboard bolt.
   - Tighten to 40 Nm (30 lb-ft).

7. Install the seat-to-floor rear outboard bolt.
   - Tighten to 40 Nm (30 lb-ft).

8. Install the 2 seat-to-floor rear bolt covers.

9. Install the front seat cushion panel shield.

10. Repower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

11. Make sure the safety belts and buckles are accessible to the occupants after installation.

Removal

WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

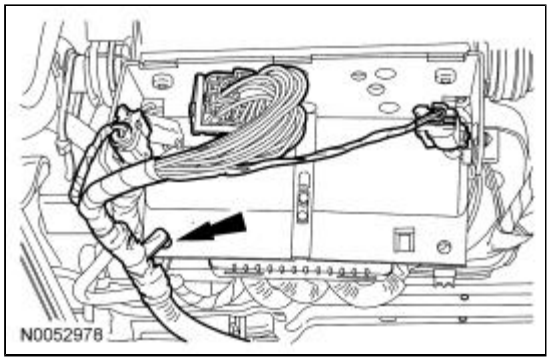
WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a SRS fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Position the seat to access all seat-to-floor fasteners.
2. Depower the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .
3. Remove the front seat cushion panel shield.
4. Remove the seat-to-floor front bolt cover.
5. Remove the 2 seat-to-floor front bolts.
6. Detach the pin-type retainer and vehicle wiring harness from the seat.



7. Disconnect the seat harness electrical connectors.
   - Disconnect the safety belt buckle pretensioner electrical connector.
     - Slide the release button and separate the connector.
   - Disconnect the side air bag electrical connector.
     - Slide the release button and separate the connector.
   - Disconnect the seat harness electrical connector.

        - Release the locking tab and rotate the assurance lever fully to disengage the seat harness electrical connector.
        - Slightly tip the connector away and disconnect.

8. Remove the 2 seat-to-floor rear bolt covers.

9. Remove the 2 seat-to-floor rear bolts.

10. Remove the center seat safety belt buckle bolt cover and bolt.

11. Remove the seat from the vehicle.

Installation

NOTE: The seat-to-floor bolts must be tightened in the sequence described in this procedure.

1. Position the seat in the vehicle.

2. Install the inboard seat-to-floor rear bolt and bolt cover.
    - Tighten to 40 Nm (30 lb-ft).

3. Install the outboard seat-to-floor front bolt and bolt cover.
    - Tighten to 40 Nm (30 lb-ft).

4. Install the inboard seat-to-floor front bolt.
    - Tighten to 40 Nm (30 lb-ft).

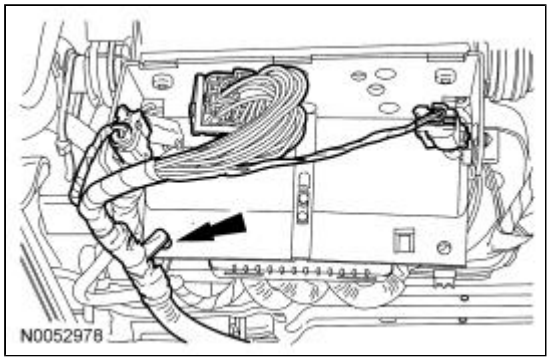
5. Install the outboard seat-to-floor rear bolt and bolt cover.
    - Tighten to 40 Nm (30 lb-ft).

6. Position the center seat safety belt buckle and install the bolt.
    - Make sure the safety belt webbing is not twisted prior to installation.
    - Tighten to 40 Nm (30 lb-ft).

7. Install the center seat safety belt buckle bolt cover.

8. Connect the electrical connectors.
    - Connect the seat harness electrical connector.
        - Make sure the electrical connector assurance lever is in the fully released position.
        - Tip the body harness connector into the seat connector and partially insert.
        - Rotate the assurance lever while pushing the connectors together until the handle is locked.
    - Connect the safety belt buckle pretensioner electrical connector.
        - Make sure the release is locked.
    - Connect the side air bag electrical connector.
        - Make sure the release is locked.

9. Install the wiring harness pin-type retainer.



10. Install the front seat cushion panel shield.

11. Repower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

12. Make sure the safety belts and buckles are accessible to the occupants after installation.

Removal and Installation

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Carry a live side air bag module with the air bag and tear seam pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live side air bag module down on the cover tear seam. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: Side air bag modules with damaged covers must be replaced.

WARNING: Front seat back trim covers installed on seats equipped with side air bags cannot be repaired, they are to be replaced. Cleaning is permissible.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: If a side air bag deployment took place, a new seat back pad, trim cover and side air bag module and nuts must be installed. The seat back frame should be replaced if necessary.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Driver seat shown, passenger seat similar.

All seats

1. Remove the affected seat and depower the supplemental restraint system (SRS). For additional information, refer to Seat — Front, 40 Percent .

2. If equipped, release the tab and remove the manual recliner lever handle.

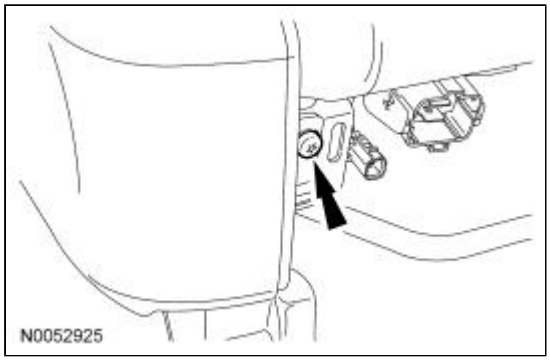
3. If equipped, remove the manual lumbar control knob.
    - Adjust the manual lumbar to the fully relaxed position.
    - Pull outward and remove the manual lumbar knob.

4. Detach and remove the cushion side shield cover.
    - If equipped, disconnect the seat control switch.
    - If equipped, disconnect the memory set switch electrical connector.

Power seat with manual recliner

5. Remove the seat control switch knob.

6. Remove the cushion side shield cover forward screw.



7. **CAUTION: Do not damage the manual recliner lever when removing the cushion side shield cover.**

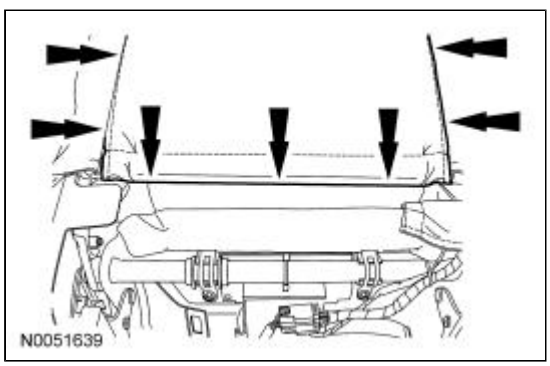
    Remove the cushion side shield cover.
    - Partially remove the cover to gain access to the seat control switch.
    - Release the retainers and detach the seat control switch from the side shield cover.
    - Remove the cushion side shield cover.

All seats

8. **NOTE:** For power seats, note the wiring harness routing for installation.

    Remove the 5 screws and cushion side shield.
    - Detach the pin-type retainer.
    - If equipped, route out the wiring harness.

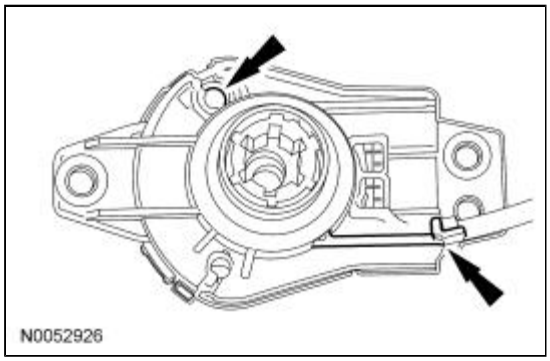
9. Release the backrest lower J-strip and unzip the 2 side zippers.



Seats with manual lumbar

10. **NOTE:** The lumbar support assembly must be fully relaxed.

    Remove the manual lumbar actuator.
    - Remove the 2 screws.
    - Remove the manual lumbar actuator.
    - Detach the lumbar cable.



11. **NOTE:** Note manual lumbar cable routing for installation.

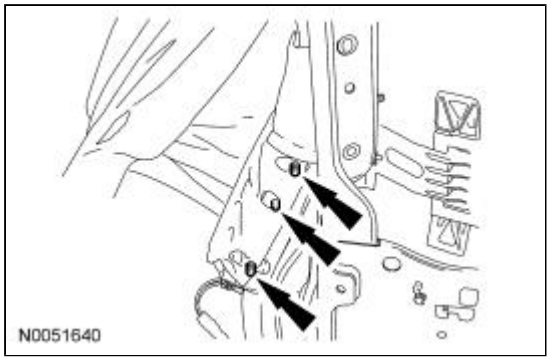
    Route the manual lumbar cable from the backrest.

12. **NOTE:** Note the position of the side air bag module locator pin to the seat backrest frame for installation.

    Remove the 2 side air bag module nuts.
    - To install, tighten to 10 Nm (89 lb-in).

13. **NOTE:** Note the position of the side air bag module locator pin and mounting studs in the seat backrest trim cover deployment chute for installation.

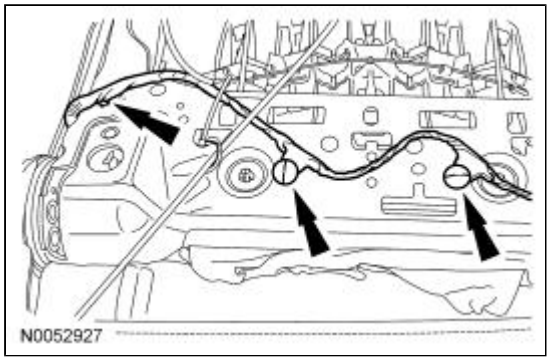
    Position the seat backrest foam aside and remove the side air bag module from the backrest frame. Then slide the side air bag module out of the seat backrest trim cover deployment chute.



14. Disconnect the electrical connector and remove the side air bag module.

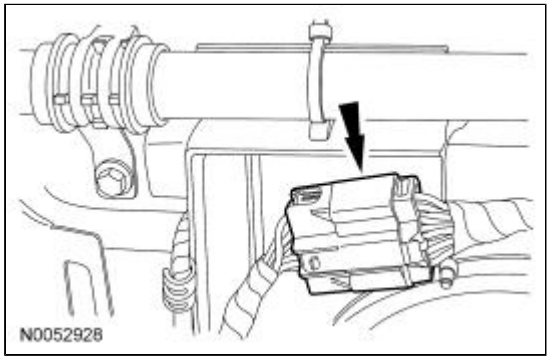
15. **NOTE:** Note wiring harness routing for installation.

    Detach the 3 pin-type retainers and route out the side air bag wiring harness.



Power and climate controlled seats

16. Disconnect the backrest wiring harness electrical connector.



17. **NOTE:** Note wiring harness routing for installation.

    Route the backrest wiring harness from the cushion.

All seats

18. Release the cushion trim cover rear hook and loop strip from the inboard side.

19. Remove the 4 backrest frame-to-seat track bolts and backrest.
    - To install, tighten to 45 Nm (33 lb-ft).

20. **WARNING: Check the side air bag module deployment chute for damage. The side air bag module deployment chute must not be repaired. If there is any damage to the deployment chute, a new seat back trim cover and deployment chute must be installed as a unit. Failure to do so may result in personal injury, in the event of an air bag deployment.**

    WARNING: Inspect the mounting surfaces of the side air bag module for any foreign objects before installing the side air bag module. If any foreign objects are found, remove them. Failure to do so may result in personal injury, in the event of an air bag deployment.

    WARNING: If the side air bag module cover has separated or the air bag material has been exposed, install a new side air bag module. Do not attempt to repair the air bag module. Failure to do so may result in personal injury, in the event of an air bag deployment.

    To install, reverse the removal procedure.

21. Install the seat and repower the SRS. For additional information, refer to Seat — Front, 40

Percent in this section.

Seat Backrest — Front, 60 Percent

Removal and Installation

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Carry a live side air bag module with the air bag and tear seam pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live side air bag module down on the cover tear seam. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: Side air bag modules with damaged covers must be replaced.

WARNING: Front seat back trim covers installed on seats equipped with side air bags cannot be repaired, they are to be replaced. Cleaning is permissible.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: If a side air bag deployment took place, a new seat back pad, trim cover and side air bag module and nuts must be installed. The seat back frame should be replaced if necessary.

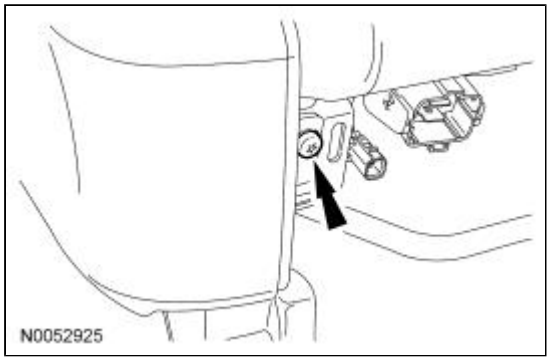
NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the front 60 percent seat and depower the supplemental restraint system (SRS). For additional information, refer Seat — Front, 60 Percent .

2. Release tab and remove the manual recliner lever handle.

3. Remove the cushion side shield cover.
   - Remove the forward screw.
   - Detach the retainer clips and remove the cover.



4. Remove the 5 screws and cushion side shield.

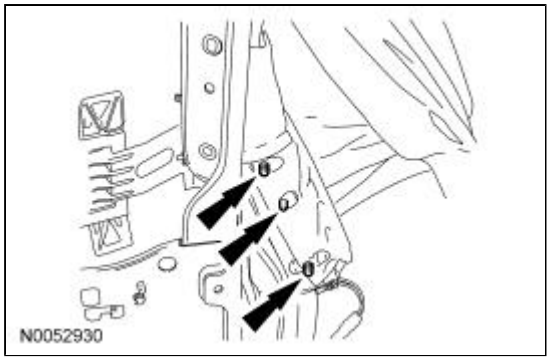
5. Release the backrest lower J-strip and unzip the 2 side zippers.

6. **NOTE:** Note the position of the side air bag module locator pin to the seat backrest frame for installation.

   Remove the 2 side air bag module nuts.
   - To install, tighten to 10 Nm (89 lb-in).

7. **NOTE:** Note the position of the side air bag module locator pin and mounting studs in the seat backrest trim cover deployment chute for installation.

   Position the seat backrest foam aside and remove the side air bag module from the backrest frame. Then slide the side air bag module out of the seat backrest trim cover deployment chute.



8. Disconnect the electrical connector and remove the side air bag module.

9. **NOTE:** Note wiring harness routing for installation.

   Route the backrest wiring harness from the cushion.
   - Detach the clip and 3 pin-type retainers.

10. Remove the 4 backrest frame-to-seat track bolts and backrest.
    - To install, tighten to 45 Nm (33 lb-ft).

11. **WARNING: Check the side air bag module deployment chute for damage. The side air bag module deployment chute must not be repaired. If there is any damage to the deployment chute, a new seat back trim cover and deployment chute must be installed as a unit. Failure to do so may result in personal injury, in the event of an air bag deployment.**

    WARNING: Inspect the mounting surfaces of the side air bag module for any foreign objects before installing the side air bag module. If any foreign objects are found, remove

them. Failure to do so may result in personal injury, in the event of an air bag deployment.

WARNING: If the side air bag module cover has separated or the air bag material has been exposed, install a new side air bag module. Do not attempt to repair the air bag module. Failure to do so may result in personal injury, in the event of an air bag deployment.

To assemble, reverse the disassembly procedure.

12. Install the 60 percent seat and repower the SRS. For additional information, refer to Seat — Front, 60 Percent in this section.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: Side air bag modules with damaged covers must be replaced.

WARNING: Front seat back trim covers installed on seats equipped with side air bags cannot be repaired, they are to be replaced. Cleaning is permissible.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: If a side air bag deployment took place, a new seat back pad, trim cover and side air bag module and nuts must be installed. The seat back frame should be replaced if necessary.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

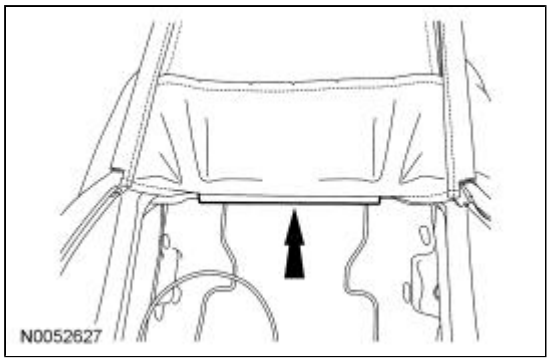
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the seat and depower the SRS. For additional information, refer to Seat — Front, 40 Percent in this section.

2. Remove the backrest assembly. For additional information, refer to Seat Backrest — Front, 40 Percent in this section.

3. Remove the head restraint.
   - Push in the RH guide button to release and remove the head restraint.

4. Raise the rear trim cover flap and release the inner J-clip.

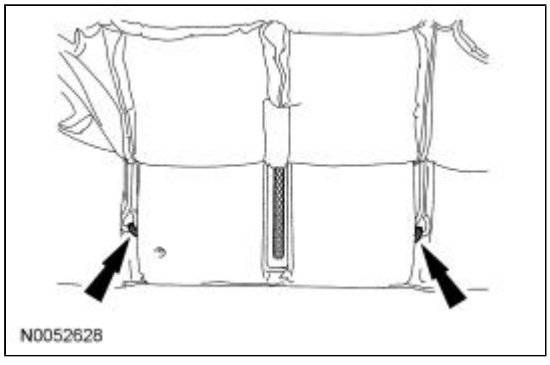


5. **NOTE:** The head restraint guides are not interchangeable. Note location for installation.

   Remove the headrest guides.
   - Reach into the backrest and pinch the headrest guide ends together to release from the backrest frame.
   - Pull the backrest trim cover away from the spring clips while pulling out the headrest guides.

6. **CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

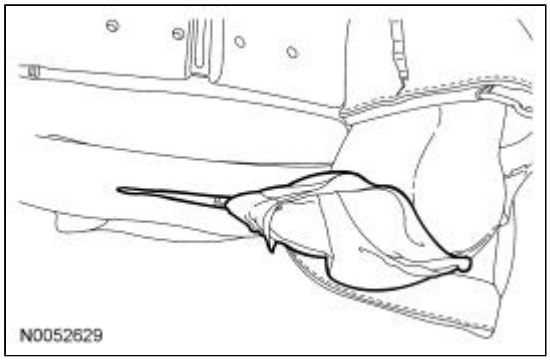
   Partially invert the backrest trim cover and remove the lower hog rings from the support wires.



7. **CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   NOTE: Note the side air bag module deployment chute routing for installation.

   Continue to invert the trim cover and remove the upper hog rings.
   - Route the side air bag module deployment chute through the slot in the foam pad.



8. Remove the backrest trim cover.

9. **WARNING: Check the side air bag module deployment chute for damage. The side air bag module deployment chute must not be repaired. If there is any damage to the deployment chute, a new seat back trim cover and deployment chute must be installed as a unit. Failure to do so may result in personal injury, in the event of an air bag deployment.**

   WARNING: Inspect the mounting surfaces of the side air bag module for any foreign objects before installing the side air bag module. If any foreign objects are found, remove them. Failure to do so may result in personal injury, in the event of an air bag deployment.

   WARNING: If the side air bag module cover has separated or the air bag material has been exposed, install a new side air bag module. Do not attempt to repair the air bag module. Failure to do so may result in personal injury, in the event of an air bag deployment.

   To assemble, reverse the disassembly procedure.

10. Install the backrest assembly. For additional information, refer to Seat Backrest — Front, 40 Percent in this section.

11. Install the seat and repower the SRS. For additional information, refer to Seat — Front, 40 Percent in this section.

Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Carry a live side air bag module with the air bag and tear seam pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live side air bag module down on the cover tear seam. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: Side air bag modules with damaged covers must be replaced.

WARNING: Front seat back trim covers installed on seats equipped with side air bags cannot be repaired, they are to be replaced. Cleaning is permissible.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: If a side air bag deployment took place, a new seat back pad, trim cover and side air bag module and nuts must be installed. The seat back frame should be replaced if necessary.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

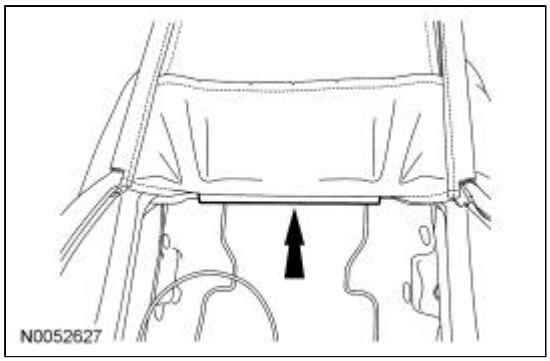
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the seat and depower the SRS. For additional information, refer to Seat — Front, 60 Percent in this section.

2. Remove the backrest assembly. For additional information, refer to Seat Backrest — Front, 60 Percent in this section.

3. Remove the head restraint.
   - Push in the RH guide button to release and remove the head restraint.

4. Raise the rear trim cover flap and release the inner J-clip.

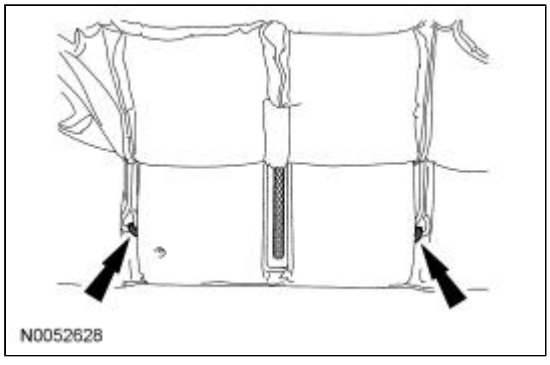


5. **NOTE:** The head restraint guides are not interchangeable. Note location for installation.

   Remove the headrest guides.
   - Reach a hand into the backrest and pinch the headrest guide ends together to release from the backrest frame.
   - Pull the backrest trim cover away from the spring clips while pulling out the headrest guides.

6. **CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

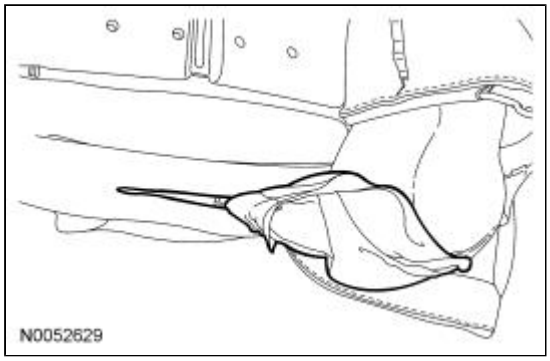
   Partially invert the backrest trim cover and remove the lower hog rings from the support wires.



7. **CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   NOTE: Note the side air bag module deployment chute routing for installation.

   Continue to invert the trim cover and remove the upper hog rings.
   - Route the side air bag module deployment chute through the slot in the foam pad.



8. Remove the trim cover.

9. **WARNING: Check the side air bag module deployment chute for damage. The side air bag module deployment chute must not be repaired. If there is any damage to the deployment chute, a new seat back trim cover and deployment chute must be installed as a unit. Failure to do so may result in personal injury, in the event of an air bag deployment.**

   WARNING: Inspect the mounting surfaces of the side air bag module for any foreign objects before installing the side air bag module. If any foreign objects are found, remove them. Failure to do so may result in personal injury, in the event of an air bag deployment.

   WARNING: If the side air bag module cover has separated or the air bag material has been exposed, install a new side air bag module. Do not attempt to repair the air bag module. Failure to do so may result in personal injury, in the event of an air bag deployment.

   To assemble, reverse the disassembly procedure.

10. Install the backrest assembly. For additional information, refer to Seat Backrest — Front, 60 Percent in this section.

11. Install the seat and repower the SRS. For additional information, refer to Seat — Front, 60 Percent in this section.

Seat Cushion Cover — Front, 40 Percent

Removal and Installation

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

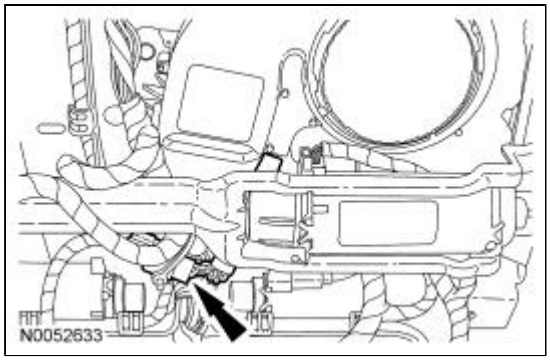
1. Remove the affected seat and depower the supplemental restraint system (SRS). For additional information, refer to Seat — Front, 40 Percent .

2. Release the cushion trim cover front and rear J-clips and hook-and-loop strip.

3. **NOTE:** Note wiring harness routing for installation.

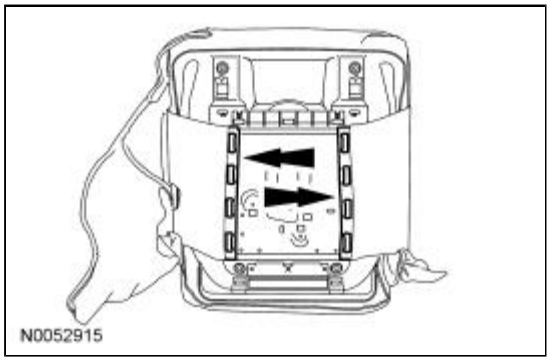
   NOTE: Use care when removing the thermo-electric device (TED). The U-nuts can slip into the cushion frame.

   If equipped, remove the climate controlled seat thermo-electric device (TED).
   - Disconnect the electrical connector.
   - Detach the pin-type retainer and wiring harness.
   - Remove the 2 screws.
   - Route the wiring harness and remove the TED.



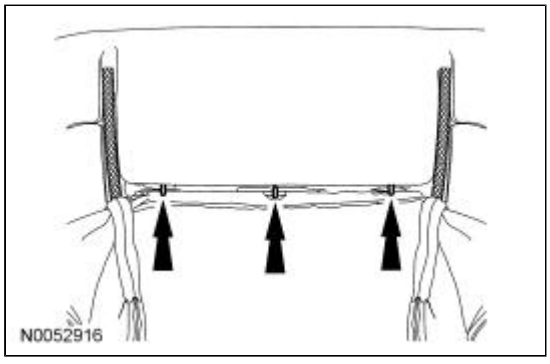
4. Remove the cushion frame from the seat track.
   - Remove the 4 cushion frame-to-seat track bolts.
     - To install, tighten to 25 Nm (18 lb-ft).
   - Release the 2 cushion frame rear clips and straps from the seat track and remove the cushion frame.

5. Release the 2 cushion trim cover retainer clips and remove the trim cover and foam pad from the cushion frame.



6. **CAUTION: Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

   Remove the cushion trim cover.
   - Partially invert the cushion trim cover to the row of hog rings and separate the hook-and-loop strips.
   - Remove the hog rings and separate the trim cover and foam pad.



7. To install, reverse the removal procedure.

8. Install the seat and repower the SRS. For additional information, refer to Seat — Front, 40 Percent in this section.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

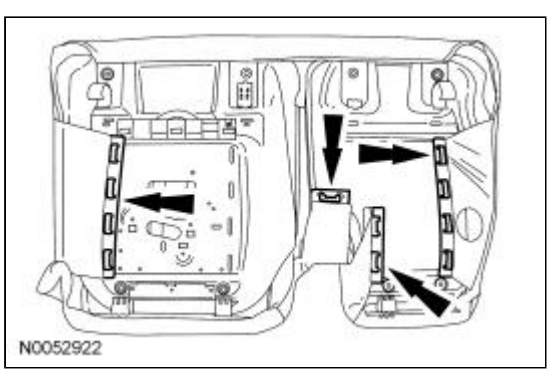
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the 60 percent seat and depower the supplemental restraint system (SRS). For additional information, refer to Seat — Front, 60 Percent in this section.

2. Release the cushion trim cover front and rear J-clips and hook-and-loop strips.

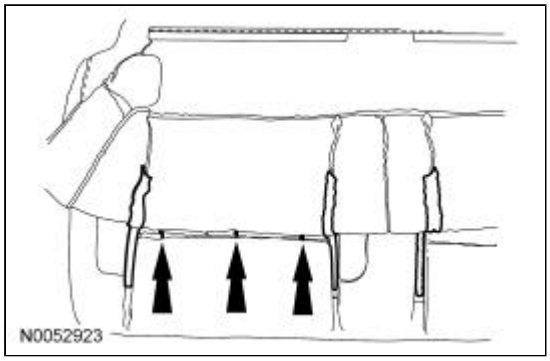
3. Remove the 2 cushion frames from the seat track.
   - Remove the 8 cushion frame-to-seat track bolts.
     - To install, tighten to 25 Nm (18 lb-ft).
   - Release the 4 cushion frame rear clips and straps from the seat track and remove both cushion frames.

4. Release the 4 cushion trim cover retainer clips and remove the trim cover and foam pad from the cushion frames.



5. **CAUTION: Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

   Remove the cushion trim cover.
   - Partially invert the cushion trim cover and separate the hook-and-loop strips.
   - Remove the hog rings and separate the trim cover and foam pad.



6. To install, reverse the removal procedure.

7. Install the seat and repower the SRS. For additional information, refer to Seat — Front, 60 Percent in this section.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

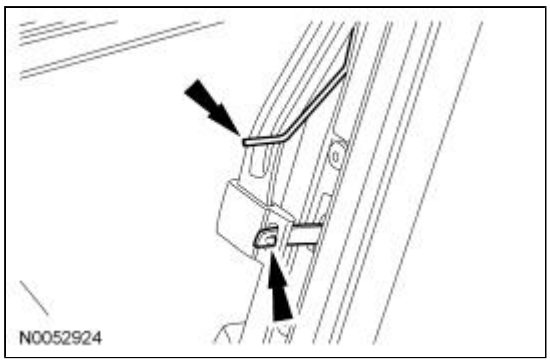
NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the affected seat and depower the supplemental restraint system (SRS). For additional information, refer to Seat — Front, 40 Percent or Seat — Front, 60 Percent in this section.

2. Remove the inboard and outboard seat track rails.
   - Remove the 6 seat track rail-to-seat track nuts from the inboard and outboard seat track rails.
     - To install, tighten to 30 Nm (22 lb-ft).
   - Remove the inboard and outboard seat track rails.
   - Release and separate the seat track adjust handle from the seat track rails.
     - **NOTE:** Note the spring position for installation.

       Disconnect the spring.
     - Slightly bend the tab and detach the seat adjust handle from the inboard seat track rail.



3. To install, reverse the removal procedure.

4. Install the seat. For additional information, refer to Seat — Front, 40 Percent or Seat — Front, 60 Percent in this section.

5. Repower the SRS. For additional information, refer to Supplemental Restraint System (SRS)

Depowering and Repowering in the General Procedures portion of Section 501-20B .

Seat Track — Power

Removal and Installation

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

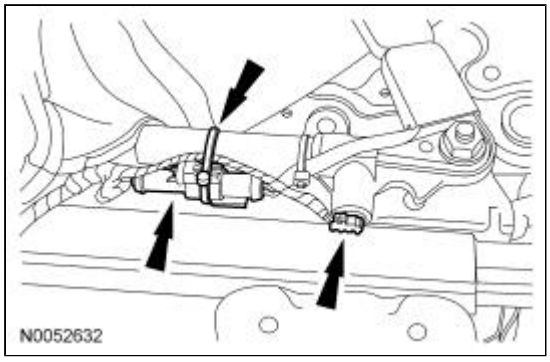
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the affected seat and depower the supplemental restraint system (SRS). For additional information, refer to Seat — Front, 40 Percent in this section.

2. Remove the seat backrest. For additional information, refer to Seat Backrest — Front, 40 Percent in this section.

3. Remove the safety belt buckle pretensioner.
   - Remove the tie strap.
   - Disconnect the 2 electrical connectors.
   - Remove the nut and safety belt buckle pretensioner.
     - To install, tighten to 55 Nm (41 lb-ft).



4. Release the cushion trim cover front and rear J-clips and rear hook-and-loop strip.

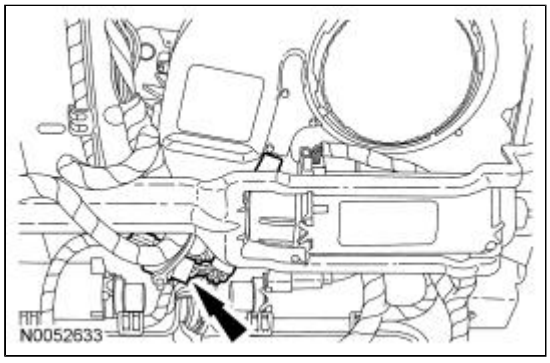
Climate controlled seats

5. **NOTE:** Use care when removing the thermo-electric device (TED). The U-nuts can slip into the cushion frame.

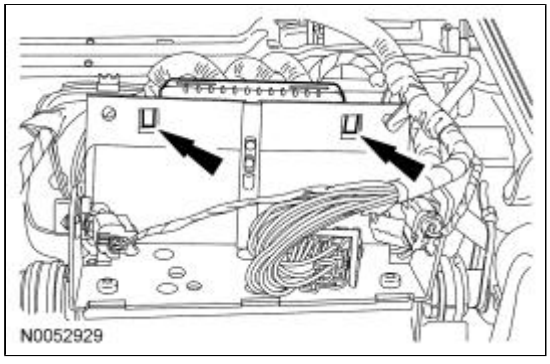
NOTE: Note wiring harness routing for installation.

Remove the climate controlled seat thermo-electric device (TED).

- Disconnect the electrical connector.
- Detach the pin-type retainer and wiring harness.
- Remove the 2 screws.
- Route the wiring harness and remove the TED.



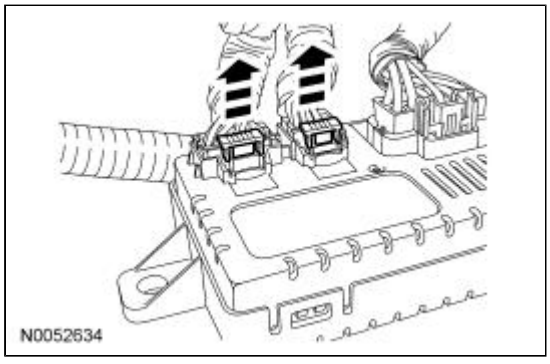
6. Release the 2 tabs and slide out the climate controlled seat module (CCSM).



7. **NOTE:** When installing a new climate control seat module (CCSM), it is necessary to carry out programmable module installation (PMI). For additional information, refer to Section 418-01 .

   If passenger seat, remove the CCSM.

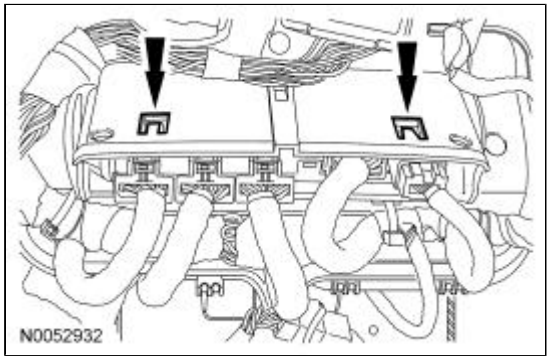
   - Cut and remove the wiring harness tie strap.
   - Release the 2 locking wedges.
   - Disconnect the 3 electrical connectors.



Driver memory seat

8. Remove the driver seat module (DSM).
   - Disconnect the 5 electrical connectors.

- Release the 2 tabs and slide out the DSM.



All seats

9. Remove the cushion frame, foam pad and trim cover assembly from the seat track.
   - Remove the 4 cushion frame-to-seat track bolts.
     - To install, tighten to 25 Nm (18 lb-ft).
   - Release the 2 cushion frame rear clips and straps from the seat track and remove the cushion frame.

10. Disconnect the seat track motor electrical connector.
    - For 6-way power seat, disconnect the 3 motor electrical connectors.
    - For memory seat, disconnect the 6 motor electrical connectors.

11. **NOTE:** Note wiring harness routing for installation.

    Remove the wiring harness.
    - Remove the 3 wiring harness bracket screws.
    - Remove the tie strap and release the rear wiring harness bracket clip from the seat track.
    - Separate the electrical connectors and wiring harness from the seat track.
    - Route and remove the wiring harness and bracket.

12. To install, reverse the removal procedure.

13. Install the seat backrest. For additional information, refer to Seat Backrest — Front, 40 Percent in this section.

14. Install the seat and repower the SRS. For additional information, refer to Seat — Front, 40 Percent in this section.

Lumbar Assembly

Printable View (81 KB)

Removal and Installation

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the affected seat and depower the supplemental restraint system (SRS). For additional information, refer to Seat — Front, 40 Percent in this section.

2. Remove the backrest assembly. For additional information, refer to Seat Backrest — Front, 40 Percent in this section.

3. Raise the backrest trim cover rear flap and release the foam pad flap from the backrest frame hooks.

4. Position aside the backrest trim cover and foam pad to gain access to the lumbar assembly bolts.

5. Remove the 4 bolts and lumbar assembly.
   - To install, tighten to 7 Nm (62 lb-in).
   - If equipped, disconnect the electrical connector from the lumbar assembly.
   - If equipped, route out the manual lumbar cable.

Manual lumbar actuator removal

6. **NOTE:** Note manual lumbar cable routing for installation.

   Remove the 2 screws and manual lumbar actuator.

All seats

7. To install, reverse the removal procedure.

8. Install the backrest assembly. For additional information, refer to Seat Backrest — Front, 40 Percent in this section.

9. Install the seat and repower the SRS. For additional information, refer to Seat — Front, 40 Percent in this section.

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

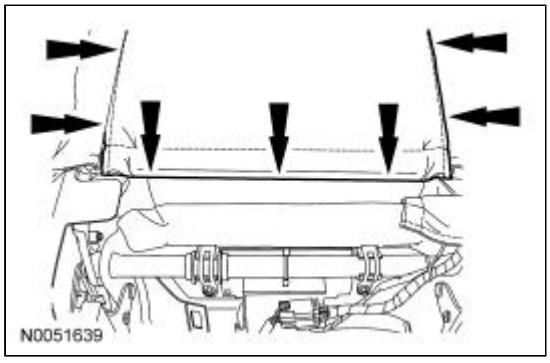
NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Position the affected seat backrest fully forward.

2. Depower the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

3. Release the seat backrest cover lower rear J-clip, then unzip the 2 side zippers.



4. Remove the climate controlled seat thermo-electric device (TED).
   - Disconnect the TED electrical connector.
   - Remove the scrivet.
   - Detach the 2 retainer clips from the backrest frame support wires.

5. To install, reverse the removal procedure.

6. Repower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

Seat Cushion Thermo-Electric Device

Removal and Installation

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

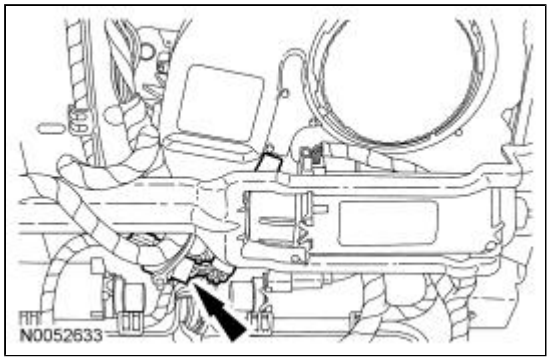
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the affected seat and depower the supplemental restraint system (SRS). For additional information, refer to Seat — Front, 40 Percent in this section.

2. **NOTE:** Use care when removing the thermo-electric device (TED). The U-nuts can slip into the cushion frame.

   NOTE: Note wiring harness routing for installation.

   Remove the climate controlled seat thermo-electric device (TED).
   - Disconnect the electrical connector.
   - Detach the pin-type retainer and wiring harness.
   - Remove the 2 screws.
   - Route the wiring harness and remove the TED.



3. To install, reverse the removal procedure.

4. Install the seat and repower the SRS. For additional information, refer to Seat — Front, 40 Percent in this section.

Climate Controlled Seat Module

Printable View (155 KB)

Removal and Installation

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

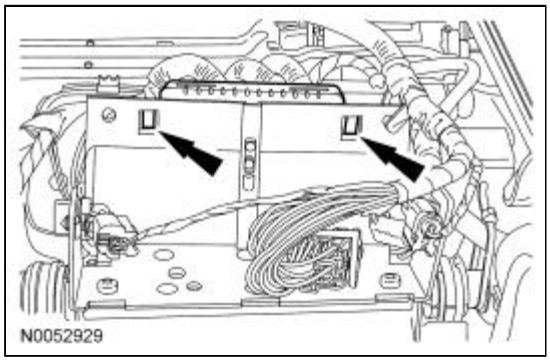
1. When installing a new climate control seat module (CCSM), carry out the appropriate steps in the programmable module installation (PMI) procedure. For additional information, refer to Section 418-01 .

2. Position the front passenger seat fully upward and depower the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

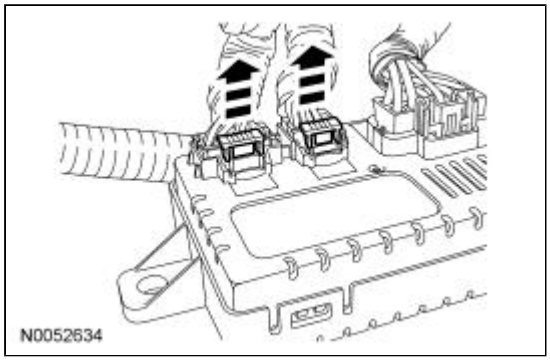
3. **CAUTION: Do not pull from the inboard side of the front seat cushion panel shield to avoid damaging it.**

   Remove the front seat cushion panel shield.
   - Release the upper retaining clips working from the outboard side and then release the lower retaining clips.

4. Release the 2 tabs and slide out the CCSM.



5. Remove the CCSM.
   - Cut and remove the wiring harness tie strap.
   - Release the 2 locking wedges.
   - Disconnect the 3 electrical connectors.



6. To install, reverse the removal procedure.

7. Repower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

8. If a new CCSM has been installed, carry out the appropriate steps in the PMI procedure. For additional information, refer to Section 418-01 .

Seat Control Switch — Front

Printable View (98 KB)

Removal and Installation

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Driver seat shown, passenger similar.

All seats

1. Position the seat forward and upward to aid in seat control switch removal.

2. Depower the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

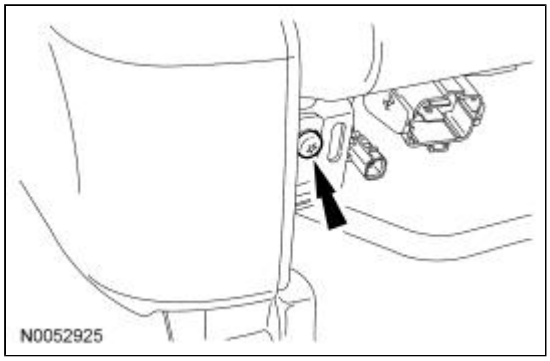
3. Pull and remove the seat control switch button(s).
   - If equipped, remove the power recliner switch button.

Power seat with manual recliner

4. **CAUTION: Do not pull from the inboard side of the front seat cushion panel shield to avoid damaging it.**

   Remove the front seat cushion panel shield.
   - Release the upper retaining clips working from the outboard side and then release the lower retaining clips.

5. Remove the cushion side shield cover forward screw.



6. **CAUTION: Do not damage the manual recliner lever when removing the cushion side shield cover.**

   Remove the cushion side shield cover.
   - Partially remove the cover to gain access to the seat control switch.
   - Release the retainers and detach the seat control switch from the side shield cover.
   - Remove the cushion side shield cover.

All seats

7. Detach and remove the cushion side shield cover.
   - Disconnect the seat control switch.
   - If equipped, disconnect the memory set switch electrical connector.

8. Release the clips and remove the seat control switch.

9. To install, reverse the removal procedure.

10. Repower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

Memory Set Switch

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Driver seat shown, passenger similar.

1. Depower the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

2. Detach and position aside the driver seat cushion side shield cover.

3. Release the clips and remove the memory set switch.
   - Disconnect the seat control switch.

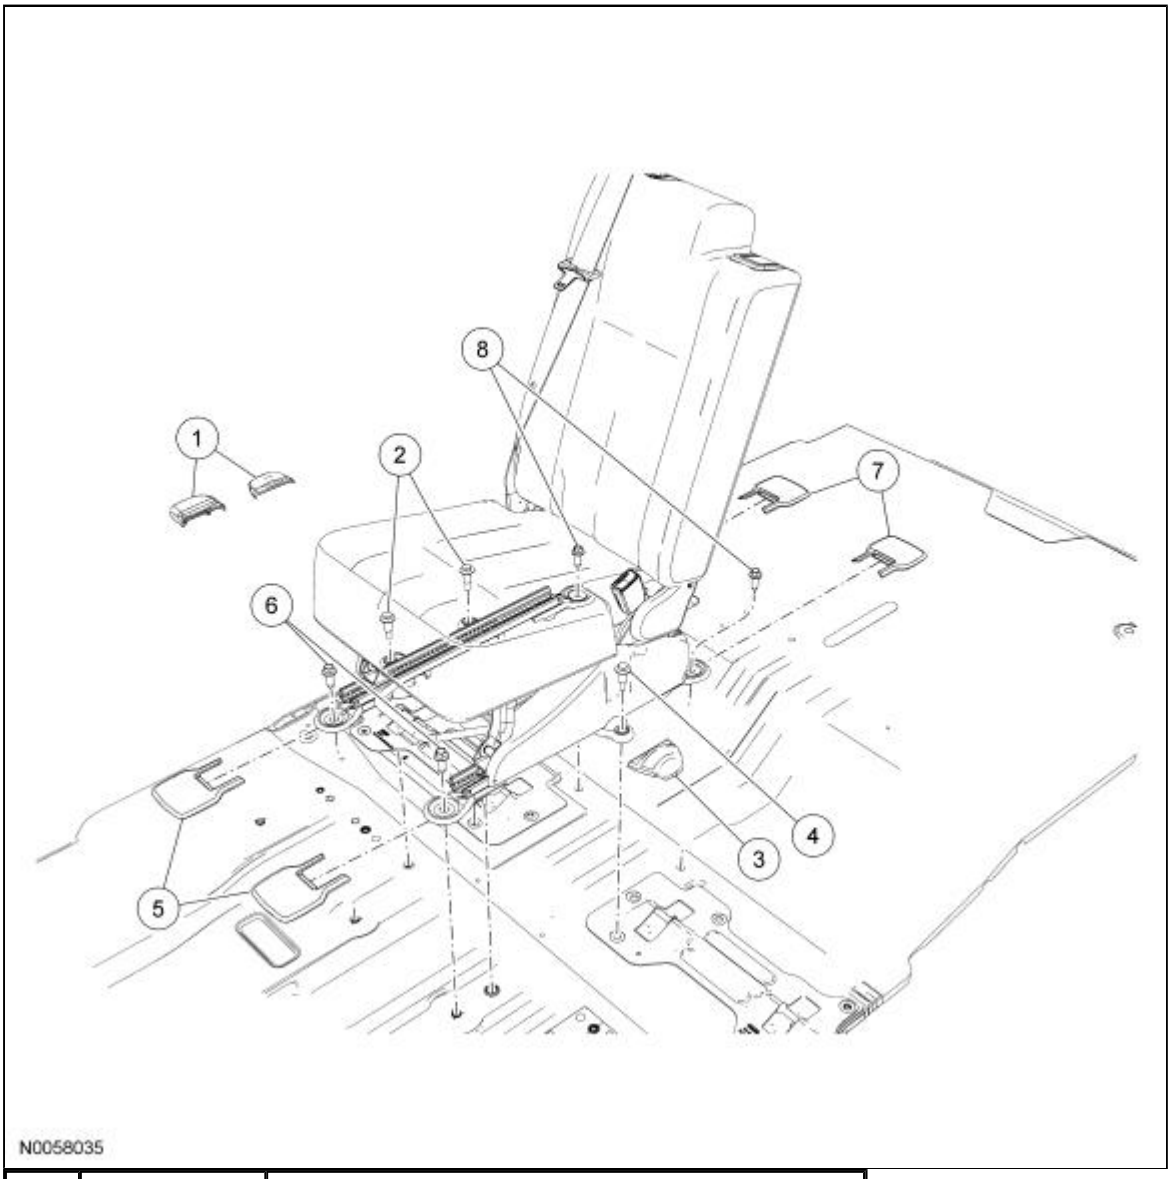
4. To install, reverse the removal procedure.

5. Repower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

Seat — Second Row, 20 Percent

Printable View (180 KB)

NOTE: For torque specifications and torque sequence, refer to the procedure steps.



Item	Part Number	Description
1	666C00	Right side seat-to-floor bolt covers (2 required)
2	W708367	Right side seat-to-floor bolts (2 required)
3	666C00	Left side seat-to-floor bolt cover
4	W708367	Left side seat-to-floor bolt
5	666C00	Seat-to-floor front bolt covers (2 required)
6	W505284	Seat-to-floor front bolts (2 required)
7	666C00	Seat-to-floor rear bolt covers (2 required)
8	W505284	Seat-to-floor rear bolts (LH/RH)

Removal and Installation

CAUTION: The seat-to-floor bolts must be installed in the sequence described.

1. Fold both 40 percent seats to the E-Z entry position.

2. **CAUTION: Use a screwdriver to pry beneath the attaching metal clips.**

   Remove the 2 right side seat-to-floor bolt covers.

3. Remove the 2 right side seat-to-floor bolts.
   - To install, tighten to 40 Nm (30 lb-ft).

4. **CAUTION: Use a screwdriver to pry beneath the attaching metal clips.**

   Remove the left side seat-to-floor bolt cover.

5. Remove the left side seat-to-floor bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

6. Position the 40 percent seats upright.

7. **CAUTION: Use a screwdriver to pry beneath the attaching metal clips.**

   Remove the 2 seat-to-floor front bolt covers.

8. **CAUTION: Use a screwdriver to pry beneath the attaching metal clips.**

   Remove the 2 seat-to-floor rear bolt covers.

9. Remove the 2 seat-to-floor front bolts.
   - To install, tighten to 40 Nm (30 lb-ft).

10. Fold both 40 percent seats to the E-Z entry position.

11. Remove the LH seat-to-floor rear bolt and then the RH seat-to-floor rear bolt.
    - To install, tighten to 40 Nm (30 lb-ft).

12. Remove the 20 percent seat from the vehicle.
    - For installation, align the locator pins to the holes in the floor.

13. **CAUTION: The seat-to-floor bolts must be installed in the sequence described.**

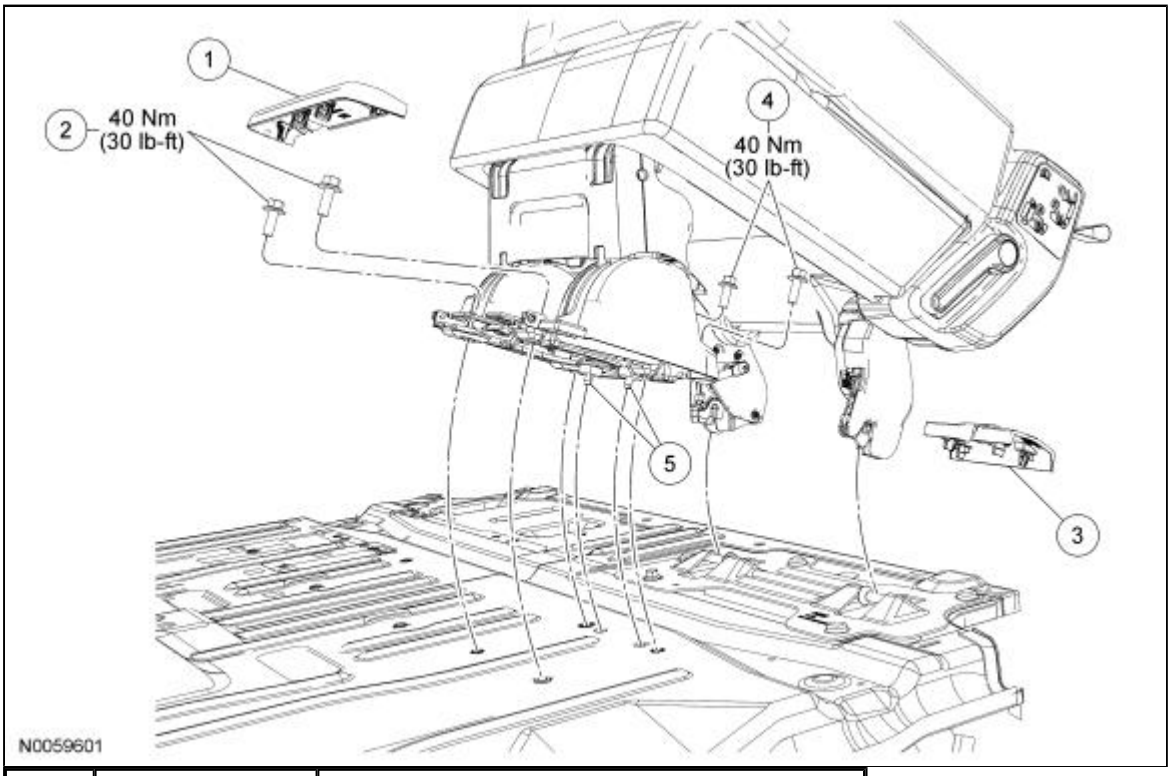
    To install, reverse the removal procedure.
    - Install the fasteners as follows:
      - Install the RH seat-to-floor rear bolt.
      - Install the LH seat-to-floor rear bolt.
      - Install the 2 seat-to-floor front bolts.
      - Install the 3 right and left side seat-to-floor bolts (note, shoulder bolts do not tighten to seat brackets).
    - Make sure the safety belts and buckles are accessible to the occupants after installation.

- Make sure the safety belt retractor operates without excessive effort or binding.

Seat — Second Row, 40 Percent

Printable View (234 KB)

NOTE: RH shown, LH similar.



Item	Part Number	Description
1	638B30A	Seat-to-floor bolt front cover
2	W708175	Seat-to-floor front bolts (2 required)
3	638B30B	Seat-to-floor bolt rear cover
4	W708175	Seat-to-floor rear bolts (2 required)
5	—	Locator pins

Removal

All seats

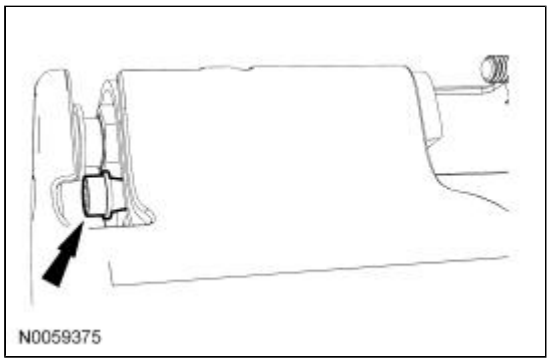
1. Place the seat in the E-Z entry position.
2. Remove the cover and 2 seat-to-floor rear bolts.
3. **NOTE:** Do not place the seat in the kneeled position (cargo mode).

   Latch the seat to the floor and lower the backrest.
4. **CAUTION: The seat base must be in the locked position, using the shipping pin, prior to seat removal, otherwise damage to the seat linkage components can occur.**

NOTE: Shown with the cushion removed for clarity.

Lock the shipping pin.

- Using an appropriate tool, slide the shipping pin outward to engage and lock the seat base.
  - Align the seat base and shipping pin, as needed.

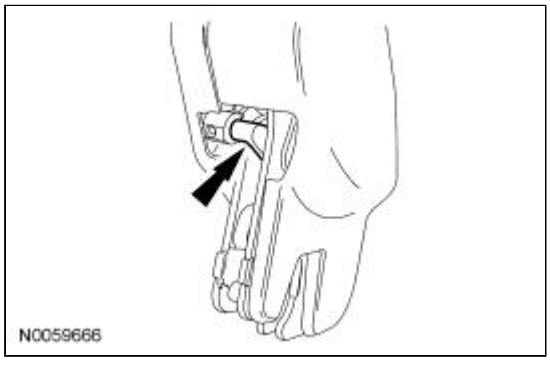


5. Remove the cover and 2 seat-to-floor front bolts.

6. Pull the recliner handle and release the latch feet.

Seat with inoperative latch, stuck to floor

7. Using an appropriate tool, manually release the latches from the striker plate.
   - Push inward on the outboard latch release lever.



All seats

8. Lift to disengage the 2 locator pins and remove the seat.

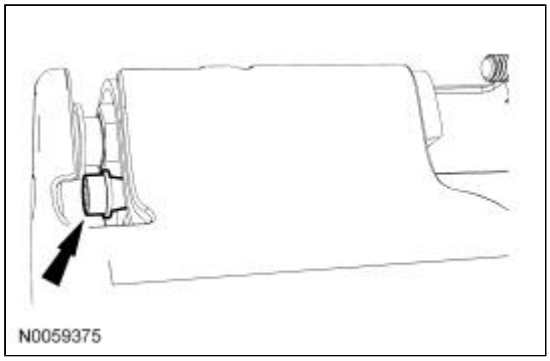
Installation

1. Position the seat in the vehicle.
   - Align the 2 locator pins to the floor holes.
   - Press downward and lock the latch feet to the floor.

2. Install the 2 seat-to-floor front bolts.
   - Tighten to 40 Nm (30 lb-ft).

3. Install the seat-to-floor bolt front cover.

4. Using an appropriate tool, push the shipping pin fully inward to unlock the seat from the E-Z entry position.



5. Release the seat to the E-Z entry position.

6. Install the 2 seat-to-floor rear bolts.
    - Tighten to 40 Nm (30 lb-ft).

7. Install the seat-to-floor rear bolt cover.

8. Check the seat for correct operation.
    - With the seat in the upright or the load floor position, both latch feet must lock to the strikers.
    - When releasing the seat to the E-Z entry position, the latches must release freely and not bind to the strikers.
    - Make sure the safety belts and buckles are accessible to the occupants after installation.

22	617D68	Recliner handle screw cover

1. For additional information, refer to the procedures in this section.

Seat Backrest — Second Row, 20 Percent

Printable View (132 KB)

Removal and Installation

1. Remove the 20 percent seat from the vehicle. For additional information, refer to Seat — Second Row, 20 Percent in this section.

2. Remove the screw and pivot bolt cover.
   - Route the attaching strap through the pivot bolt cover.

3. Release the 2 lower backrest trim cover J-clips.

4. Remove the pin-type retainer and detach the LH side attaching strap.

5. Remove the 2 screws and RH side shield.
   - Raise the backrest upright to access and remove the center screw.
   - Release the 2 pin-type retainers.

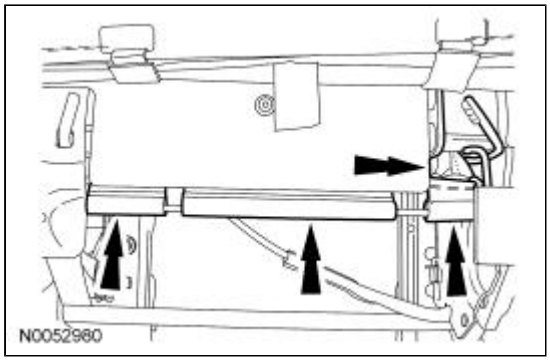
6. **NOTE:** Note attaching strap routing for installation.

   Remove the pin-type retainer and detach the RH attaching strap.

7. Remove the bolt and detach the safety belt retractor anchor.
   - To install, tighten to 55 Nm (41 lb-ft).

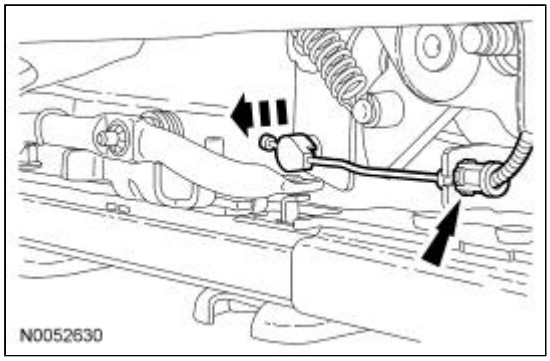
8. Remove the 2 pin-type retainers and lower panel.

9. Release the 3 lower backrest J-clips and route the RH trim cover flap through the child safety seat lower anchor and tether for children (LATCH) anchor.



10. Detach the 2 J-clips and remove the attaching straps.

11. Detach the cable end and latch release cable from the seat base.



12. **CAUTION: Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-an-loop strip can be torn from the cushion foam pad.**

    Partially invert the backrest trim cover to access the backrest fasteners.

13. Position aside the foam pad and remove the 2 swivel bolts.
    - To install, tighten to 30 Nm (22 lb-ft).

14. Remove the pivot bolt.
    - To install, tighten to 55 Nm (41 lb-ft).

15. Remove the 2 backrest-to-cushion bolts.
    - To install, tighten to 40 Nm (30 lb-ft).

16. **NOTE:** Note cable routing for installation.

    Remove the seat backrest.
    - Route out the latch release cable.

17. To install, reverse the removal procedure.

Seat Backrest Cover — Second Row, 20 Percent

Printable View (102 KB)

Removal and Installation

1. Remove the 20 percent seat from the vehicle. For additional information, refer to Seat — Second Row, 20 Percent in this section.

2. Remove the screw and pivot bolt cover.
   - Route the attaching strap through the pivot bolt cover.

3. Release the 2 lower backrest trim cover J-clips.

4. Remove the pin-type retainer and detach the LH side attaching strap.

5. Remove the 2 screws and RH side shield.
   - Raise the backrest upright to access and remove the center screw.
   - Release the 2 pin-type retainers.

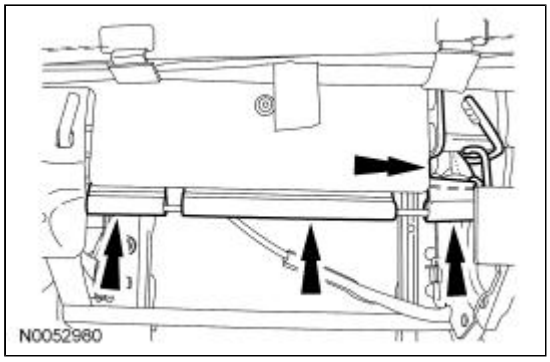
6. **NOTE:** Note attaching strap routing for installation.

   Remove the pin-type retainer and detach the RH attaching strap.

7. Remove the bolt and detach the safety belt retractor anchor.
   - To install, tighten to 55 Nm (41 lb-ft).

8. Remove the 2 pin-type retainers and lower panel.

9. Release the 3 lower backrest J-clips and route the RH trim cover flap through the child safety seat lower anchor and tether for children (LATCH) anchor.



10. Detach the 2 J-clips and remove the attaching straps.

11. Remove the safety belt guide cover.
    - Insert an appropriate tool into the holes and release the 3 locking tabs.
    - Detach the safety belt guide cover.
    - Route the safety belt webbing through the slot.

12. Remove the latch release handle bezel.
    - Release the upper tab and separate the bezel from the latch release handle.

13. **CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-an-loop strip can be torn from the backrest foam pad.**

    Separate the hook-and-loop strips and invert the backrest trim cover to the row of hog rings.

14. Remove the row of hog rings.

15. Continue inverting and remove the backrest trim cover.
    - Route the safety belt webbing through the trim cover opening.

16. To install, reverse the removal procedure.

Seat Backrest Cover — Second Row, 40 Percent

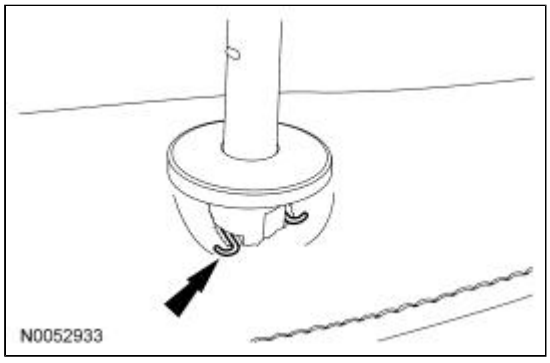
Printable View (110 KB)

Removal and Installation

1. **NOTE:** Note the spring clip position for installation.

   NOTE: Use care when releasing the spring clips. They can fall inside the backrest frame.

   Remove the head restraint.
   - Pull the trim cover material away from the head restraint guide to access the spring clips.
   - Release the 2 spring clips by pushing on the side shown.
   - Raise and remove the head restraint.

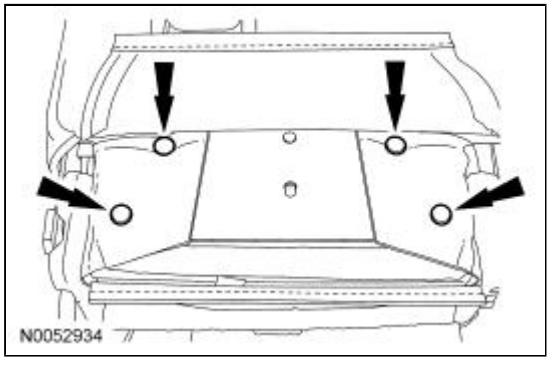


2. Position the backrest downward.

3. Remove the kneeling release (cargo mode) handle.
   - Raise the handle to access the cable.
   - Detach the cable jacket from the kneeling release handle.
   - Release the retainers and position aside the kneeling release handle.

4. Release the lower backrest trim cover J-clip.

5. Position aside the backrest trim cover rear flap and remove the 4 pin-type retainers.



6. Raise the backrest upright and route the backrest trim cover from between the cushion and backrest.

7. **CAUTION: Use care when separating the seat backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat backrest foam pad.**

   Invert the backrest trim cover to the row of hog rings.
   - Separate the hook-and-loop strips.

8. Remove the row of hog rings.

9. Continue inverting the backrest trim cover to the head restraint guides.

10. **CAUTION: Be careful not to tear the material when separating the head restraints and spring clips from the backrest trim cover.**

    Pinch the head restraint guide ends to release and remove the 2 head restraint guides.
    - Separate the head restraint guides from the backrest trim cover.

11. Remove the backrest trim cover.

12. To install, reverse the removal procedure.

Seat Cushion Cover — Second Row, 20 Percent

Printable View (80 KB)

Removal and Installation

1. Remove the 20 percent seat. For additional information, refer to Seat — Second Row, 20 Percent in this section.

2. Release the 2 backrest trim cover lower J-clips.

3. Remove the screw and pivot bolt cover.
   - Route out the attaching strap.

4. Remove the 2 pin-type retainers and lower panel.

5. Release the cushion trim cover rear J-clip.
   - Position the backrest downward to aid in trim cover removal.
   - Route the cushion trim cover rear flap and J-clip from between the cushion and backrest.

6. Release the hook-and-loop strip and remaining cushion J-clips.

7. Remove the cushion foam pad and trim cover.

8. **CAUTION: Use care when separating the seat cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat cushion foam.**

   Release the hook-and-loop strips and invert the cushion trim cover to the row of hog rings.

9. Remove the hog rings and cushion trim cover.

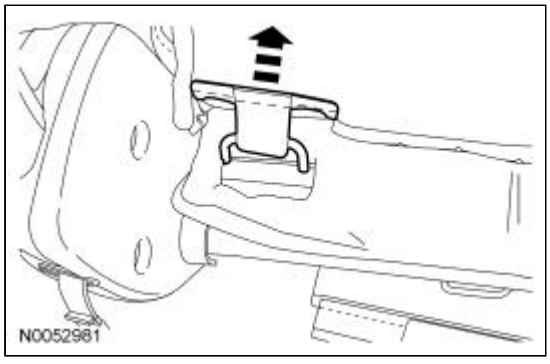
10. To install, reverse the removal procedure.

Seat Cushion Cover — Second Row, 40 Percent

Printable View (99 KB)

Removal and Installation

1. Place the seat in the E-Z entry position.
2. Release the trim cover J-clips from both sides of the cushion.
3. Release the outer and inner rear J-clips from the cushion.
4. Latch the seat to the floor and raise the backrest.
5. Release the front J-clip from the cushion.
6. Release the 2 cushion trim cover retainers from the 2 child safety seat LATCH anchors.
   - Pull the cushion trim cover rearward and release the 2 clips.



7. **CAUTION: Use care when separating the seat cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat cushion foam.**

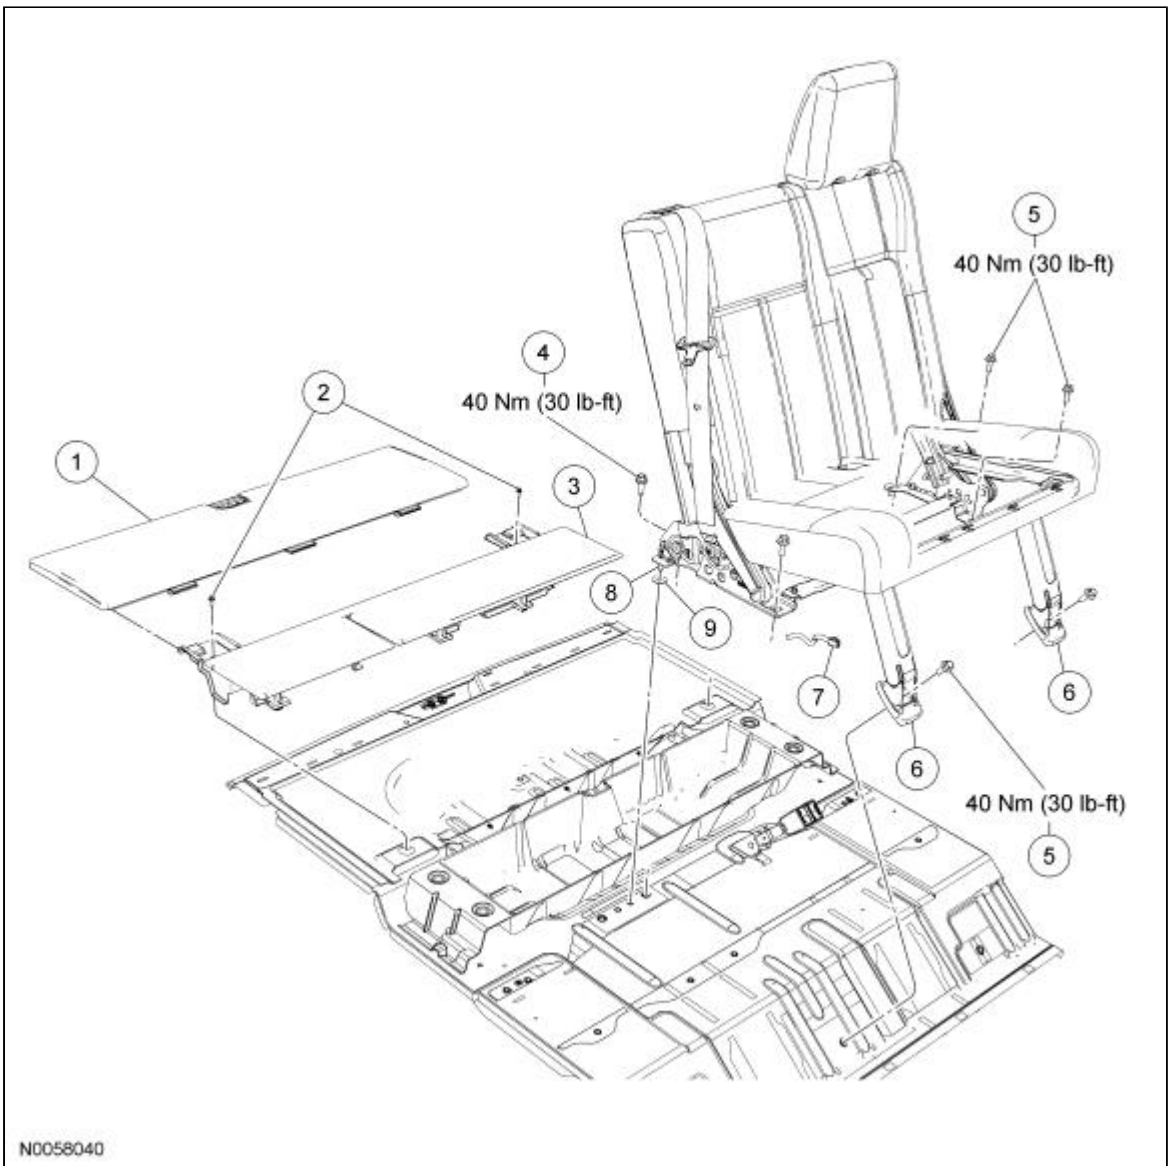
   Separate the hook-and-loop strips and invert the cushion trim cover to the row of hog rings.
8. Remove the row of hog rings.
9. Remove the cushion trim cover.
   - Route the trim cover from between the cushion and backrest.
10. To install, reverse the removal procedure.

Seat — Third Row

Printable View (260 KB)

NOTE: 60 percent seat shown, 40 percent seat similar.

NOTE: For torque specifications and torque sequence, refer to the procedure steps.



Item	Part Number	Description
1	W708818	Load floor panel
2	—	Mid-floor panel support bolts
3	—	Mid-floor panel support
4	W505284	Seat-to-floor bolt, rear inboard
5	W708175	Seat-to-floor bolts (5 required)
6	666C00	Seat-to-floor bolt front covers (2 required)
7	—	Electrical connector

8	—	Locator pin (part of 600M47)
9	60108K	Gasket (2 required)

Removal and Installation

CAUTION: To prevent possible damage to the third row seat or the safety belts, make sure that the safety belts are not fastened when moving the seat to the load floor position.

CAUTION: Make sure that no objects such as books, purses or briefcases on the floor in front of the third row seats or on the seat cushion before lowering the backrest(s).

NOTE: The third row seat backrests need to be in the raised position for removal of the third row seats.

NOTE: LH seat shown, RH seat similar.

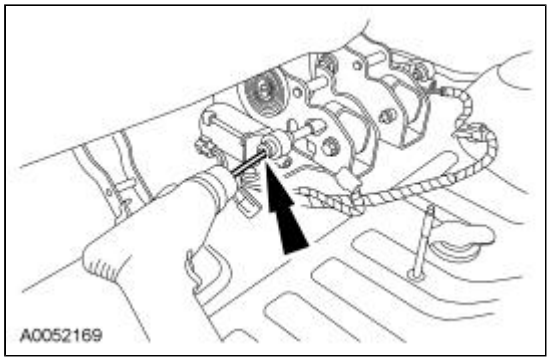
All seats

1. Remove the load floor panel.

2. Remove the 2 bolts and mid-floor panel support.
   - Detach the 3 pin-type retainers.

Power-fold seats with inoperative motor, backrest in down position

3. Using a suitable tool, insert it in the outboard side of the third row power seat motor. Raise the seat backrest.
   - If the power seat motor is seized, remove the power-fold seat motor. For additional information, refer to Power-Fold Seat Motor in this section.
     - Rotate the power seat torque shaft in the seat actuator to raise the backrest.



Power-fold seats

4. Detach the wire harness pin-type retainer and disconnect the power-fold seat motor electrical connector.

All seats

5. Remove the 6 seat-to-floor bolts.
   - Access and remove the 2 seat-to-floor front bolts.
     - To install, tighten to 40 Nm (30 lb-ft).
   - Remove the 2 seat-to-floor center bolts.
     - To install, tighten to 40 Nm (30 lb-ft).
   - Remove the 2 seat-to-floor rear bolts.

        - To install, tighten to 40 Nm (30 lb-ft).

6. **NOTE:** Do not scuff the safety belt buckles when removing the 60 percent seat.

   Lift and remove the seat from the vehicle.
   - For 60 percent seat, raise the seat support bar over the safety belt buckles.
   - To install, align the 2 locator pins to the holes in the floor.
     - For installation, make sure the 2 gaskets are positioned to the locator pins.

7. To install, reverse the removal procedure.
   - Make sure the safety belts and buckles are accessible to the occupants after installation.
   - For 60 percent seat, make sure the safety belt retractor operates without excessive effort or binding.

1. For additional information, refer to the procedures in this section.

Seat Backrest — Third Row, 40 Percent

Printable View (83 KB)

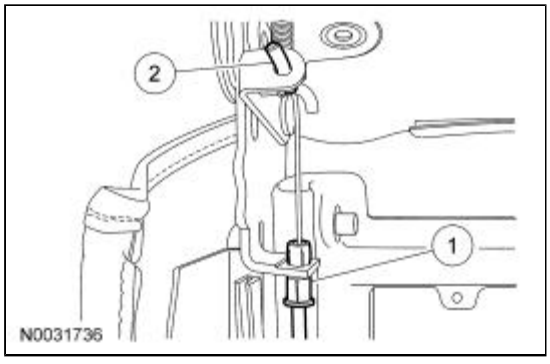
Removal and Installation

All seats

1. Remove the third row 40 percent seat. For additional information, refer to Seat — Third Row in this section.
2. Remove the 2 screws and the inboard and outboard slide bracket covers.
3. Release the backrest trim cover lower and inboard J-clips.

Manual fold seat

4. Remove the manual seat cable.
    1. Pinch the cable end and remove the cable from the retainer.
    2. Release the cable end hook from the retaining hole.



All seats

5. Remove the outboard slide bracket-to-backrest frame and outboard slide bracket-to-outboard latch nuts.
    - To install, tighten to 15 Nm (11 lb-ft).
6. Remove the inboard slide bracket-to-backrest frame and inboard slide bracket-to-inboard latch nuts.
    - To install, tighten to 15 Nm (11 lb-ft).
7. Remove the backrest from the cushion.
8. To install, reverse the removal procedure.

Seat Backrest — Third Row, 60 Percent

Printable View (85 KB)

Removal and Installation

All seats

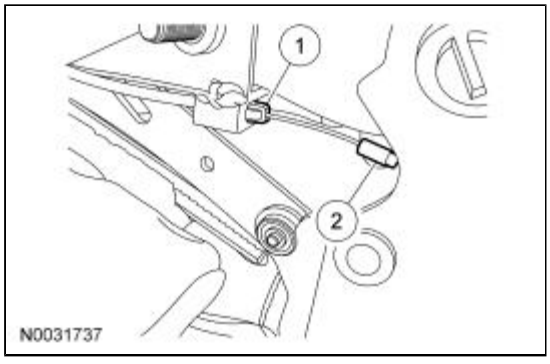
1. Remove the third row 60 percent seat. For additional information, refer to Seat — Third Row in this section.

2. Remove the 2 screws and the inboard and outboard slide bracket covers.

3. Release the backrest trim cover lower and inboard J-clips.

Manual fold seats

4. Remove the manual seat cable.
    1. Pinch the cable end and remove the cable from retainer.
    2. Release the cable end hook from the retaining hole.



All seats

5. Remove the outboard slide bracket-to-backrest frame and outboard slide bracket-to-outboard latch nuts.
    - To install, tighten to 15 Nm (11 lb-ft).

6. Remove the inboard slide bracket-to-backrest frame and inboard slide bracket-to-inboard latch nuts.
    - To install, tighten to 15 Nm (11 lb-ft).

7. Remove the backrest from the cushion.

8. To install, reverse the removal procedure.

Seat Backrest Cover — Third Row

Printable View (105 KB)

Removal and Installation

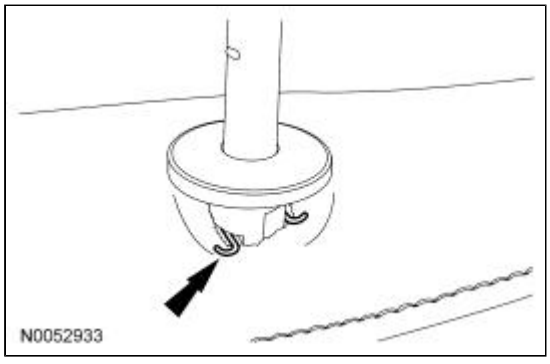
NOTE: LH seat shown, RH seat similar.

All seats

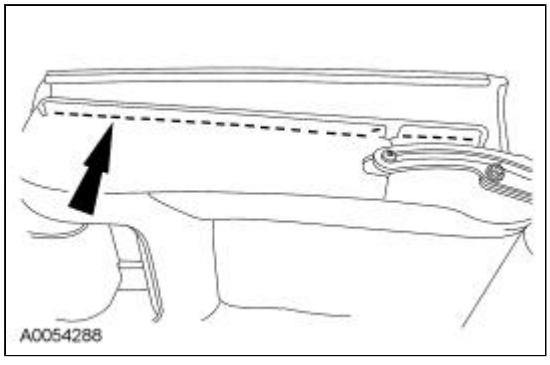
1. Remove the affected seat. Refer to Seat — Third Row in this section.
2. Remove the seat backrest. Refer to Seat Backrest — Third Row, 40 Percent or Seat Backrest — Third Row, 60 Percent in this section.
3. **NOTE:** Note the spring clip position for installation.

   NOTE: Use care when releasing the spring clips. They can fall inside the backrest frame.

   Remove the head restraint.
   - Pull the trim cover material away from the head restraint guide to access the spring clips.
   - Release the 2 spring clips by pushing on the side shown.
   - Raise and remove the head restraint.



4. Release all the backrest trim cover J-clips.
5. Remove all the staples.



LH seat

6. Release the hook-and-loop strip.

7. Remove the safety belt anchor bolt.
    - To install, tighten to 40 Nm (30 lb-ft).

8. Remove the safety belt guide cover.

Manual fold seat

9. **NOTE:** Note cable routing for installation.

    Remove the 2 screws and the manual latch handle and cable assembly.
    - Route out the cable.

All seats

10. **NOTE:** The head restraint sleeve pins are not interchangeable. Note location for installation.

    Reach up into backrest and squeeze the head restraint guide ends together to release and pull the 2 head restraint guides out.

11. **CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

    Separate the hook-and-loop strips and invert the backrest trim cover to the row of hog rings.

12. Remove the row of hog rings.

13. Remove the trim cover.
    - For LH seat backrest, route the safety belt webbing through the trim cover.

14. To install, reverse the removal procedure.

Seat Cushion Cover — Third Row

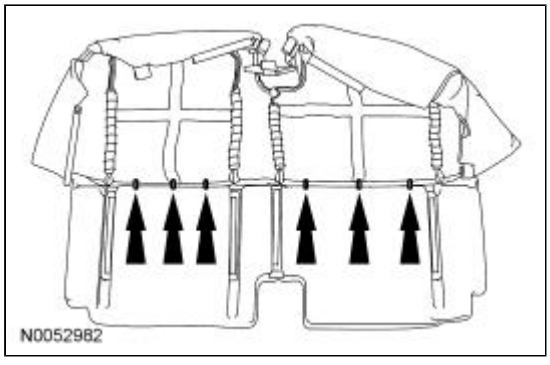
Printable View (102 KB)

Removal and Installation

NOTE: LH seat shown, RH seat similar.

1. Remove the affected seat. Refer to Seat — Third Row in this section.
2. Raise the cushion and release the trim cover hook-and-loop strips and J-clips.
3. Remove the cushion trim cover and foam pad from the cushion frame.
4. **CAUTION: Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

   Separate the hook-and-loop strips and invert the trim cover to the row of hog rings.



5. Remove the row of hog rings and remove the trim cover.
6. To install, reverse the removal procedure.

Power-Fold Seat Motor

Printable View (79 KB)

Removal and Installation

NOTE: LH seat shown, RH seat similar.

1. Remove the load floor panel.

2. Remove the 2 bolts and mid-floor panel support.
   - Detach the 3 pin-type retainers.

3. Detach the wiring harness pin-type retainer and disconnect the affected power seat motor electrical connector.

4. **NOTE:** Note position of bushing shoulder for installation.

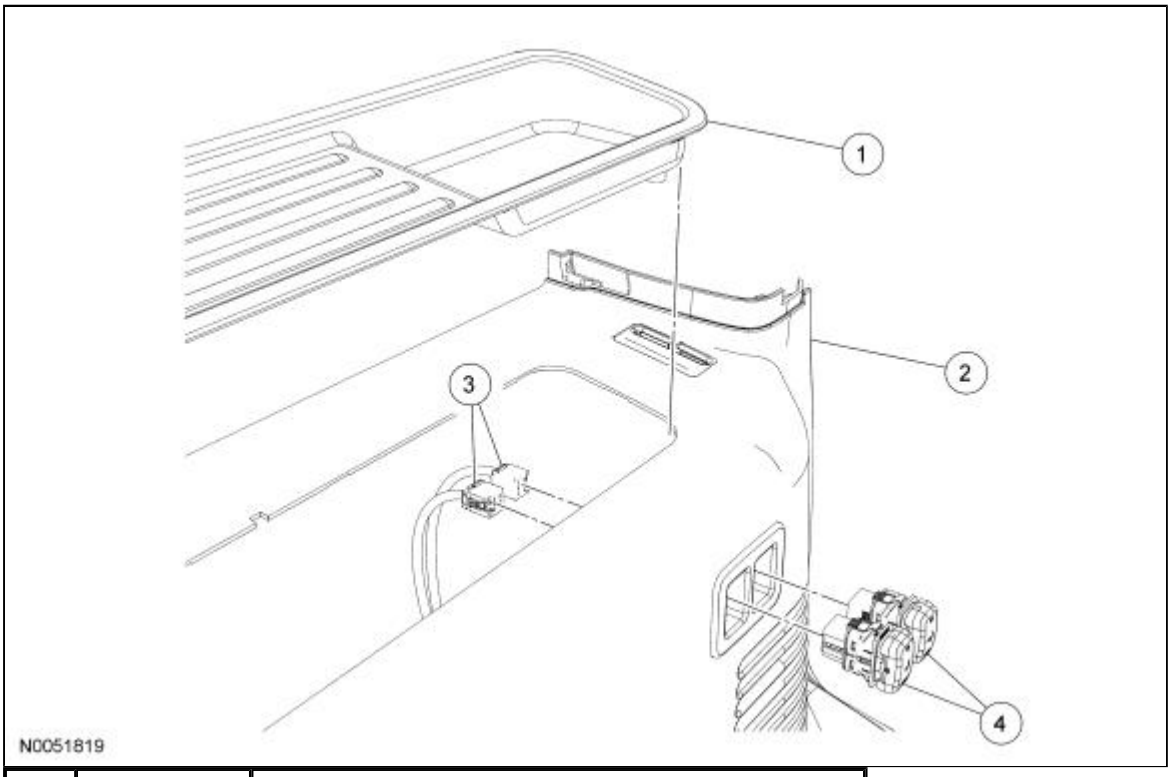
   Remove the bracket-to-pivot bolt and bushing from the power-fold seat motor.
   - To install, tighten to 30 Nm (22 lb-ft).

5. Remove the bracket-to-latch bolt and power-fold seat motor.
   - Slide the power-fold seat motor and bracket away from the latch and torque shaft.
     - For installation, slightly rotate the torque shaft until seated into the power-fold seat motor.
   - To install, tighten to 30 Nm (22 lb-ft).

6. To install, reverse the removal procedure.

Seat Control Switch — Third Row

Printable View (136 KB)



Item	Part Number	Description
1	13530	Tray, RH rear quarter trim panel
2	31012	RH rear quarter trim panel
3	—	Electrical connectors (part of wire harness 13A409)
4	14C715	LH and RH third row seat control switches

Removal and Installation

1. Release and remove the tray from the RH rear quarter trim panel.

2. **NOTE:** The LH and RH switch wiring harness electrical connectors are not interchangeable.

   Remove the affected seat control switch.
   - Reach a hand behind the RH rear quarter trim panel and squeeze together the 2 tabs on the affected seat control switch to release.
   - Pull the seat control switch through the opening and disconnect the electrical connector.

3. To install, reverse the removal procedure.

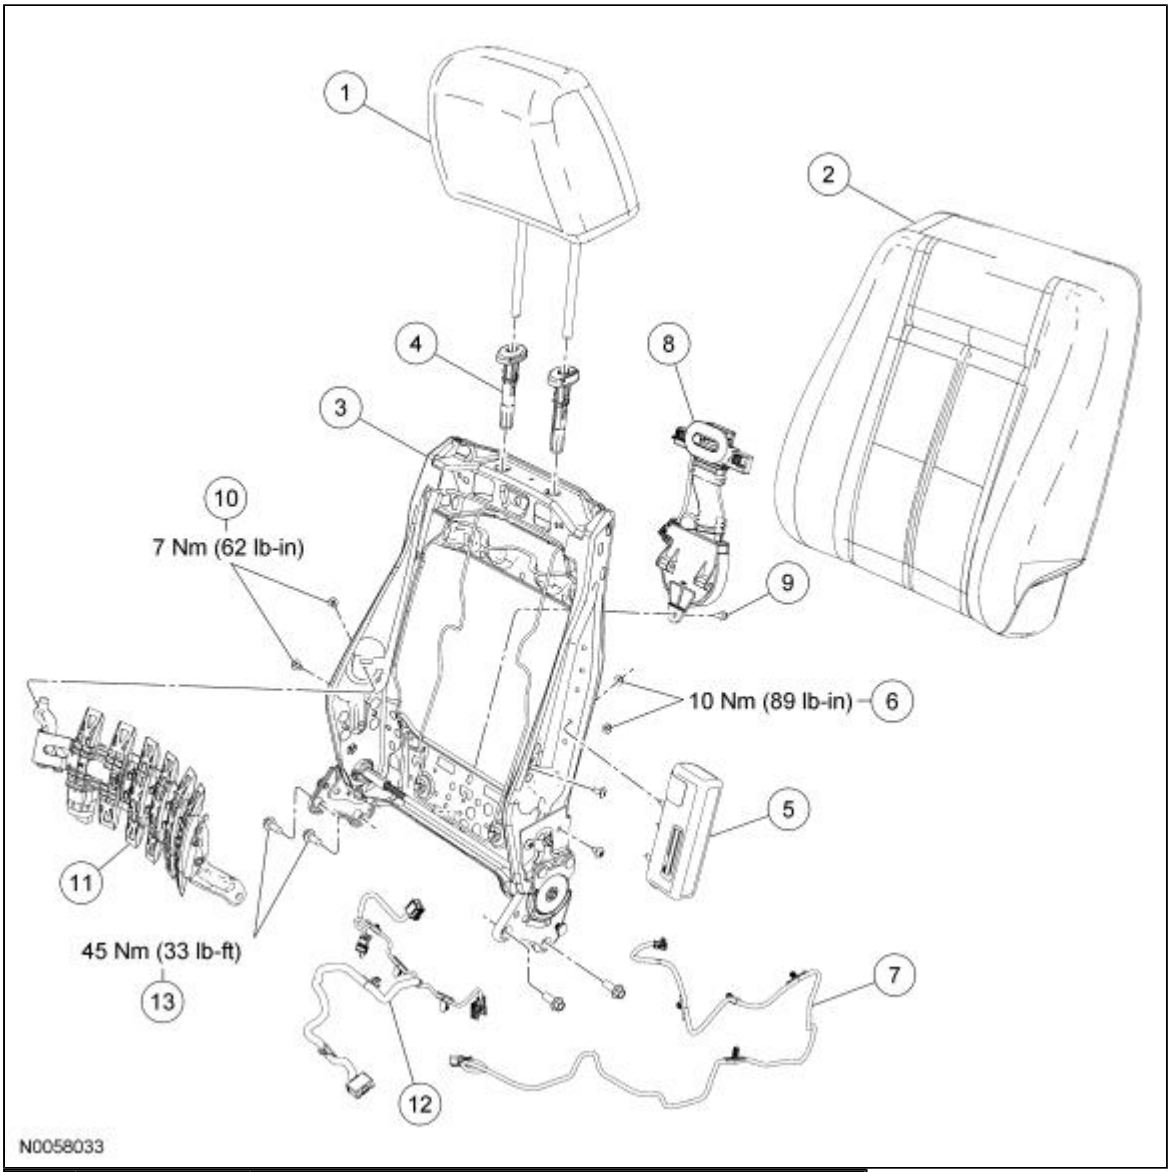
Seat Backrest — Front

Printable View (280 KB)

NOTE: Driver backrest shown, passenger similar.

NOTE: 40 Percent seat backrest shown, 60 percent seat backrest similar.

NOTE: Backrest with power recline shown, backrest with manual recline similar.



Item	Part Number	Description
1	611A08	Head restraint
2	64416/64810	Backrest trim cover/foam pad
3	61019	Backrest frame assembly
4	610A16	Head restraint guide (2 required)
5	611D10	Side air bag module

6	N620480	Nuts, side air bag module
7	14K155	Wiring harness, side air bag
8	14C712	Backrest thermo-electric device (TED)
9	N803946	Scrivet
10	—	Screws, lumbar (4 required)
11	65500	Lumbar assembly
12	14A699	Wiring harness
13	—	Backrest-to-cushion bolts (4 required) (part of hardware kit 000A25)

Disassembly and Assembly

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Carry a live side air bag module with the air bag and tear seam pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live side air bag module down on the cover tear seam. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

WARNING: Side air bag modules with damaged covers must be replaced.

WARNING: Front seat back trim covers installed on seats equipped with side air bags cannot be repaired, they are to be replaced. Cleaning is permissible.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: If a side air bag deployment took place, a new seat back pad, trim cover and side air bag module and nuts must be installed. The seat back frame should be replaced if necessary.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

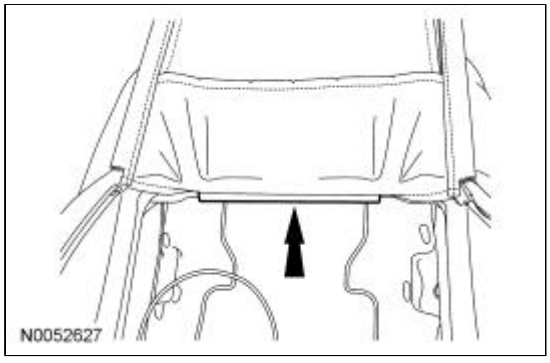
All seats

1. Remove the affected seat and depower the supplemental restraint system (SRS). For additional information, refer to Seat — Front, 40 Percent or Seat — Front, 60 Percent in this section.

2. Remove the backrest assembly. For additional information, refer to Seat Backrest — Front, 40 Percent or Seat Backrest — Front, 60 Percent in this section.

3. Remove the head restraint.
   - Push in the RH guide button to release and remove the head restraint.

4. Raise the rear trim cover flap and release the inner J-clip.

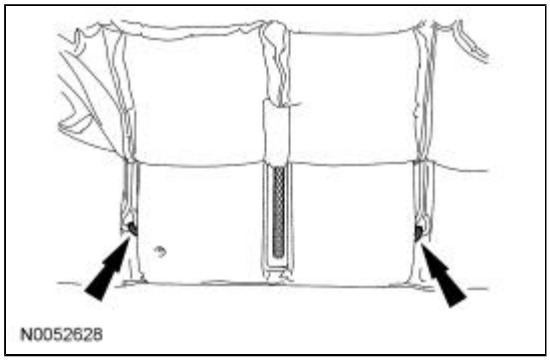


5. **NOTE:** The head restraint guides are not interchangeable. Note location for installation.

   Remove the headrest guides.
   - Reach into the backrest and pinch the headrest guide ends together to release from the backrest frame.
   - Pull the backrest trim cover away from the spring clips while pulling out the headrest guides.

6. **CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

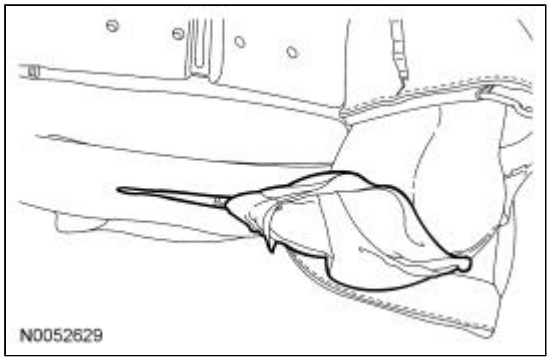
   Partially invert the backrest trim cover and remove the lower hog rings from the support wires.



7. **CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   NOTE: Note the side air bag module deployment chute routing for installation.

   Continue to invert the trim cover and remove the upper hog rings.
   - Route the side air bag module deployment chute through the slot in the foam pad.



8. Remove the backrest trim cover.

9. Release the lower flap from the backrest frame hooks and remove the backrest foam pad.

10. Remove the 4 bolts and lumbar assembly.
    - To install, tighten to 7 Nm (62 lb-in).
    - If equipped, disconnect the electrical connector from the lumbar assembly.
    - If equipped, route out the manual lumbar cable.

Climate controlled seats

11. Remove the climate controlled seat thermo-electric device (TED).
    - Disconnect the TED electrical connector.
    - Remove the scrivet.
    - Detach the 2 retainer clips from the backrest frame support wires.

Seats with power recliner

12. Disconnect the recliner motor electrical connector.

Power and climate controlled seats

13. **NOTE:** Note the wiring harness routing for installation.

    Detach the clip and pin-type retainer and remove the backrest wiring harness.

All seats

14. **WARNING: Check the air bag deployment chute for damage. The air bag deployment chute must not be repaired. If there is any damage to the deployment chute, a new seat back trim cover and deployment chute must be installed as a unit. Failure to do so may result in personal injury, in the event of an air bag deployment.**

    WARNING: Inspect the mounting surfaces of the side air bag module for any foreign objects before installing the side air bag module. If any foreign objects are found, remove them. Failure to do so may result in personal injury, in the event of an air bag deployment.

    WARNING: If the air bag cover has separated or the air bag material has been exposed, install a new side air bag module. Do not attempt to repair the air bag module. Failure to do so may result in personal injury, in the event of an air bag deployment.

    To assemble, reverse the disassembly procedure.

15. Install the backrest assembly. For additional information, refer to Seat Backrest — Front, 40 Percent or Seat Backrest — Front, 60 Percent in this section.

16. Install the seat and repower the SRS. For additional information, refer to Seat — Front, 40 Percent or Seat — Front, 60 Percent in this section.

Seat Cushion — Front, 40 Percent

21	14711	Knob, seat control switch
22	14A701	Seat control switch
23	14776	Memory set switch (if equipped)
24	61737	Recliner handle (if equipped)
25	62622	Manual lumbar knob (if equipped)
26	—	Screw, wiring harness bracket (3 required) (part of hardware kit 000A25)

Disassembly and Assembly

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

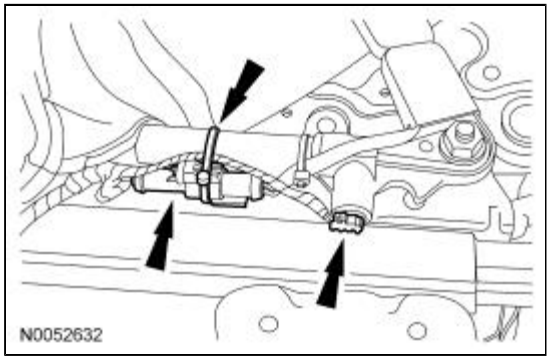
All seats

1. Remove the affected seat and depower the supplemental restraint system (SRS). For additional information, refer to Seat — Front, 40 Percent .

2. Remove the seat backrest. For additional information, refer to Seat Backrest — Front, 40 Percent in this section.

3. Release the cushion trim cover front and rear J-clips and rear hook-and-loop strip.

4. Remove the safety belt buckle pretensioner.
    - Remove the tie strap.
    - Disconnect the 2 safety belt buckle pretensioner electrical connectors.
    - Remove the nut and safety belt buckle pretensioner.
        - To install, tighten to 55 Nm (41 lb-ft).

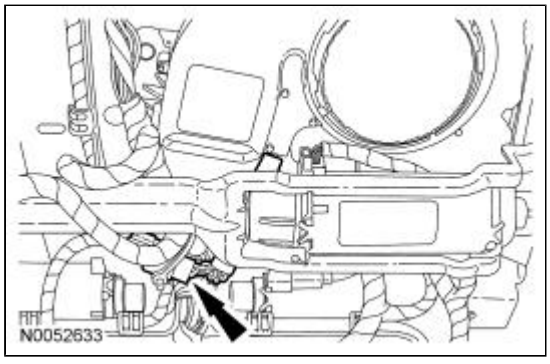


Climate controlled seats

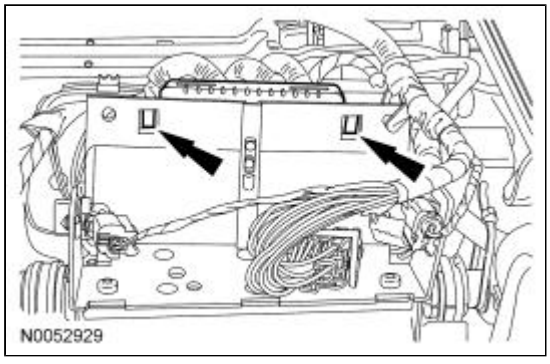
5. **NOTE:** Use care when removing the thermo-electric device (TED). The U-nuts can slip into the cushion frame.

   NOTE: Note wiring harness routing for installation.

   Remove the climate controlled seat thermo-electric device (TED).
    - Disconnect the electrical connector.
    - Detach the pin-type retainer and wiring harness.
    - Remove the 2 screws.
    - Route the wiring harness and remove the TED.



6. Release the 2 tabs and slide out the climate control seat module (CCSM).

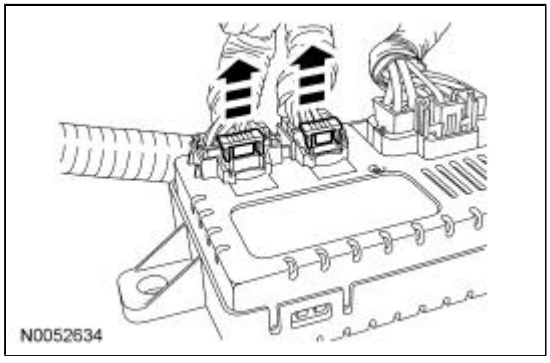


7. **NOTE:** When installing a new climate control seat module (CCSM), it is necessary to carry out

programmable module installation (PMI). For additional information, refer to Section 418-01 .

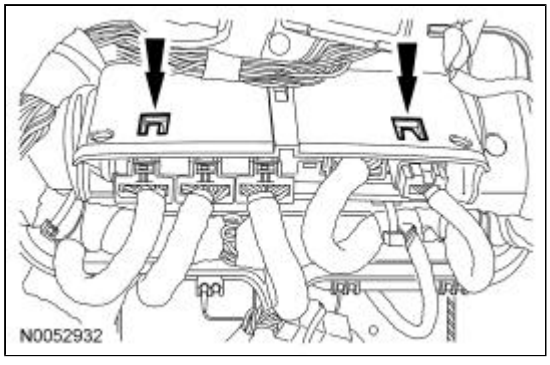
If passenger seat, remove the CCSM.

- Cut and remove the wiring harness tie strap.
- Release the 2 locking wedges.
- Disconnect the 3 electrical connectors.



Driver memory seat

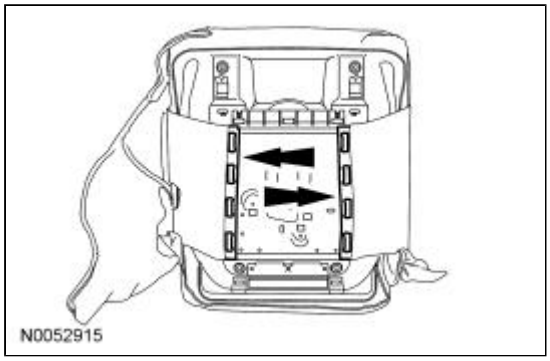
8. Remove the driver seat module (DSM).
   - Disconnect the 5 electrical connectors.
   - Release the 2 tabs and slide out the DSM.



All seats

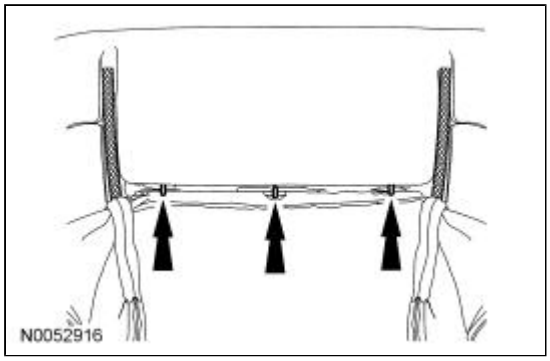
9. Remove the cushion frame from the seat track.
   - Remove the 4 cushion frame-to-seat track bolts.
     - To install, tighten to 25 Nm (18 lb-ft).
   - Release the 2 cushion frame rear clips and straps from the seat track and remove the cushion frame.

10. Release the 2 cushion trim cover retainer clips and remove the trim cover and foam pad from the cushion frame.



11. **CAUTION: Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

    Remove the cushion trim cover.
    - Partially invert the cushion trim cover and separate the hook-and-loop strips.
    - Remove the hog rings and separate the trim cover and foam pad.



Driver seat

12. Disconnect the SRS seat position sensor electrical connector and detach the wiring harness pin-type retainer.

Power seat

13. Disconnect the seat track motor electrical connectors.
    - For power seat track, disconnect the 3 motor electrical connectors.
    - For memory seat track, disconnect the 6 motor electrical connectors.

14. **NOTE:** Note wiring harness routing for installation.

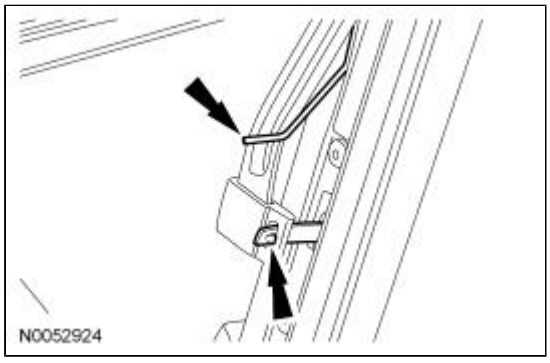
    Remove the wiring harness.
    - Remove the 3 wiring harness bracket screws.
    - Remove the tie strap and release the rear wiring harness bracket clip from the seat track.
    - Separate the electrical connectors and wiring harness from the seat track.
    - Route and remove the wiring harness and bracket.

Manual seat

15. Remove the inboard and outboard seat track rails.
    - Remove the 6 seat track rail-to-seat track nuts from the inboard and outboard seat track rails.
        - To install, tighten to 30 Nm (22 lb-ft).

- Remove the inboard and outboard seat track rails.
- Release and separate the seat track adjust handle from the seat track rails.
  - **NOTE:** Note the spring position for installation.

    Disconnect the spring.
  - Slightly bend the tab and detach the seat adjust handle from the inboard seat track rail.



All seats

16. To assemble, reverse the disassembly procedure.

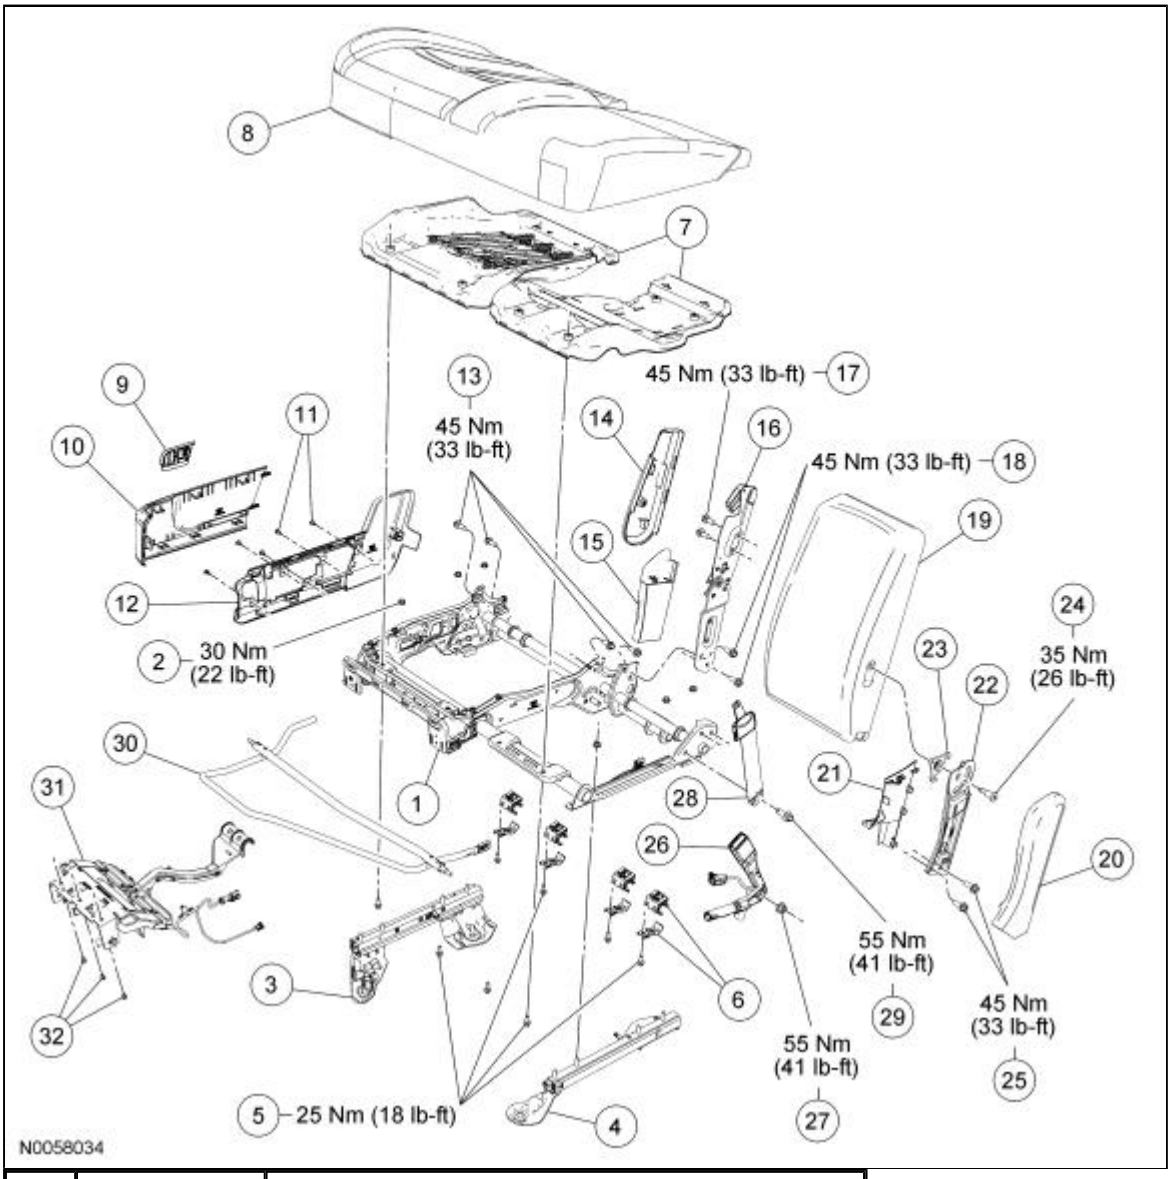
17. Install the seat backrest. For additional information, refer to Seat Backrest — Front, 40 Percent in this section.

18. Install the seat and repower the SRS. For additional information, refer to Seat — Front, 40 Percent in this section.

Seat Cushion — Front, 60 Percent

Printable View (403 KB)

NOTE: Sixty percent manual seat track shown, 40 percent manual seat track similar.



Item	Part Number	Description
1	61705	Seat track
2	—	Nut, seat track rail-to-seat track (6 required) (part of hardware kit 000A25)
3	—	Outboard seat track rail (part of 61705)

31	14A699	Wiring harness and bracket assembly
32	—	Screws, wiring harness and bracket (3 required) (part of hardware kit 000A25)

Disassembly and Assembly

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: To reduce the risk of personal injury, do not use any memory saver devices.

NOTE: The air bag warning lamp illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

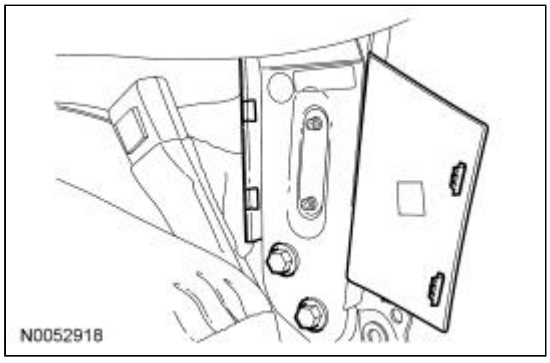
1. Depower the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

2. Remove the 60 percent seat. For additional information, refer to Seat — Front, 60 Percent in this section.

3. Remove the 60 percent seat backrest. For additional information, refer to Seat Backrest — Front, 60 Percent in this section.

4. Separate and remove the armrest bracket inner and outer covers.

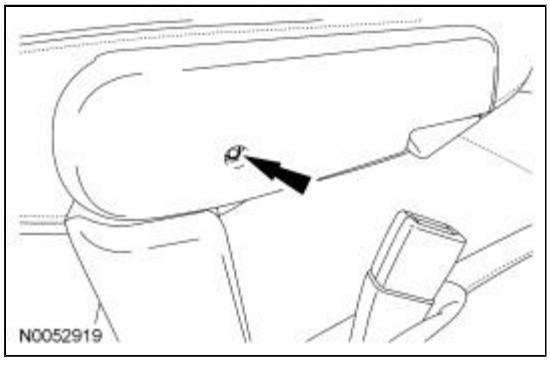
5. Open the armrest latch lower cover.



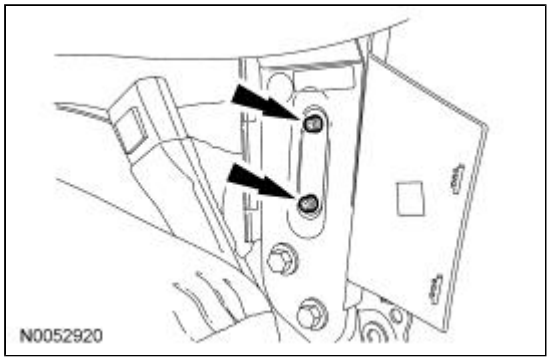
6. Remove the armrest and brackets from the seat track.
    - Remove the 2 armrest latch-to-seat track bolts.
        - To install, tighten to 45 Nm (33 lb-ft).
    - Remove the 2 armrest bracket-to-seat track bolts.
        - To install, tighten to 45 Nm (33 lb-ft).

Armrest disassembly

7. Remove the screw, release the clips and remove the armrest latch upper cover.



8. Detach the 2 pin-type retainers and remove the armrest latch lower cover.



9. Remove the armrest pivot bolt and armrest bracket.
    - To install, tighten to 35 Nm (26 lb-ft).

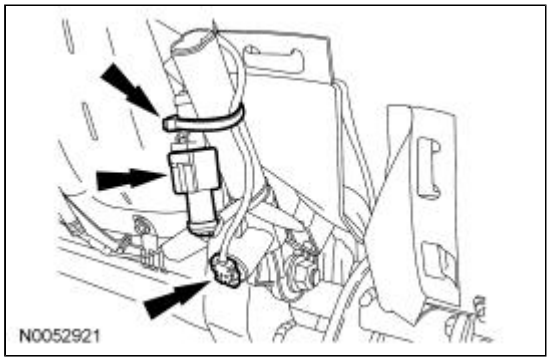
10. Remove the 2 armrest latch bolts and armrest latch.
    - To install, tighten to 45 Nm (33 lb-ft).

All seats

11. Release the cushion trim cover front and rear J-clips.

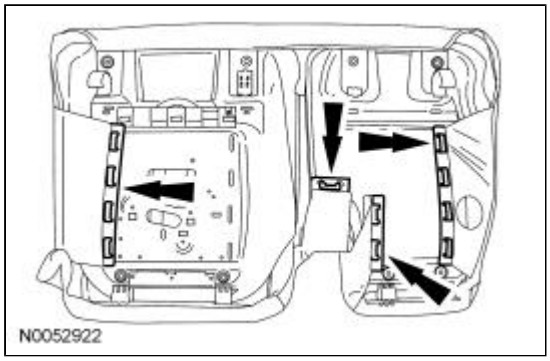
12. Remove the center seat safety belt bolt and center seat safety belt.
    - To install, tighten to 55 Nm (41 lb-ft).

13. Remove the safety belt buckle pretensioner.
    - Remove the tie strap.
    - Disconnect the 2 safety belt buckle pretensioner electrical connectors.
    - Remove the nut and safety belt buckle pretensioner.
        - To install, tighten to 55 Nm (41 lb-ft).



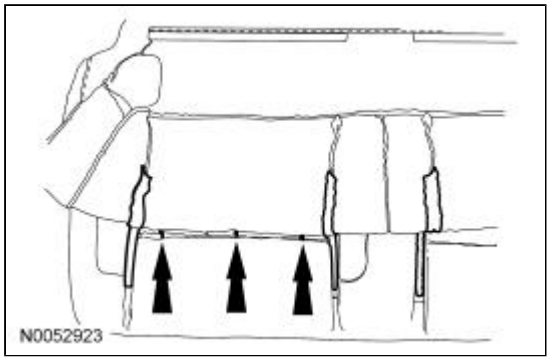
14. Remove the 2 cushion frames from the seat track.
    - Remove the 8 cushion frame-to-seat track bolts.
        - To install, tighten to 25 Nm (18 lb-ft).
    - Release the 4 cushion frame rear clips and straps from the seat track and remove both cushion frames.

15. Release the 4 cushion trim cover retainer clips and remove the trim cover and foam pad from the cushion frames.



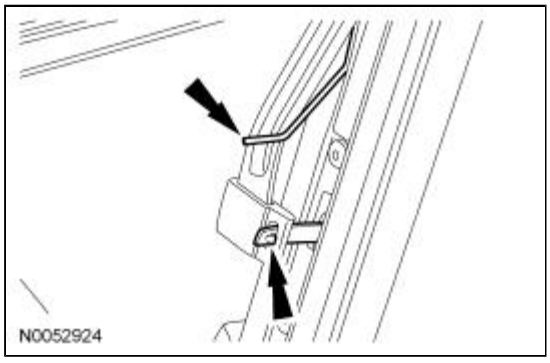
16. **CAUTION: Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

    Remove the cushion trim cover.
    - Partially invert the cushion trim cover and separate the hook-and-loop strips.
    - Remove the hog rings and separate the trim cover and foam pad.



17. Remove the inboard and outboard seat track rails.
    - Remove the 6 seat track rail-to-seat track nuts from the inboard and outboard seat track rails.
        - To install, tighten to 30 Nm (22 lb-ft).
    - Remove the inboard and outboard seat track rails.
    - Release and separate the seat track adjust handle from the seat track rails.
        - **NOTE:** Note the spring position for installation.

          Disconnect the spring.
        - Slightly bend the tab and detach the seat adjust handle from the inboard seat track rail.



18. **NOTE:** Note wiring harness routing for installation.

Remove the wiring harness.

- Remove the 3 wiring harness bracket screws.
- Remove the tie strap and release the rear wiring harness bracket clip from the seat track.
- Separate the electrical connectors and wiring harness from the seat track.
- Route and remove the wiring harness and bracket.

19. To assemble, reverse the disassembly procedure.

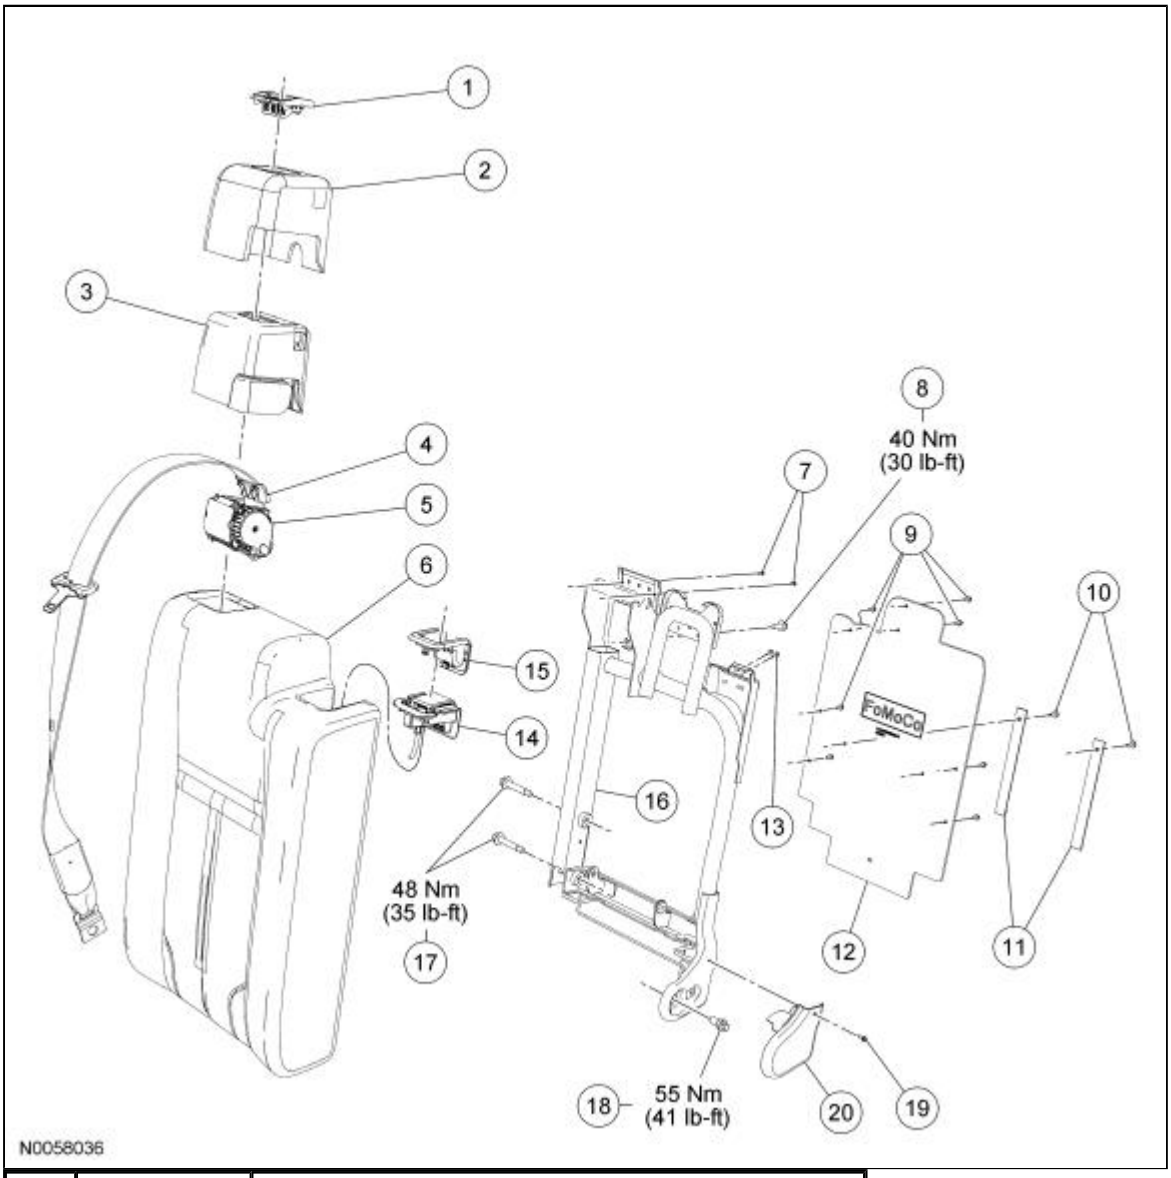
20. Install the 60 percent seat backrest. For additional information, refer to Seat Backrest — Front, 60 Percent in this section.

21. Install the 60 percent seat. For additional information, refer to Seat — Front, 60 Percent in this section.

22. Repower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

Seat Backrest — Second Row, 20 Percent

Printable View (206 KB)



Item	Part Number	Description
1	666C04	Safety belt guide cover
2	611D52	Foam, safety belt retractor cover
3	613C46	Safety belt retractor cover
4	—	Safety belt retractor guide (part of 611B64)
5	611B64	Safety belt retractor
6	66600/66800	Backrest trim cover/foam pad
7	W504042	Safety belt retractor cover screws (2 required)
8	W505274	Safety belt retractor bolt
9	—	Backrest support panel screws (8 required) (part of 613A38)

10	W701259	Pin-type retainers (2 required)
11	63518	Attaching straps (2 required)
12	613A38	Backrest support panel
13	—	Screws, release handle (2 required)
14	62418	Release handle
15	624A08	Release handle bezel
16	613A38	Backrest frame
17	W506542	Backrest-to-cushion bolts (2 required)
18	613F18	Pivot bolt
19	W504042	Screw, pivot bolt cover
20	62178	Pivot bolt cover

Disassembly and Assembly

1. Remove the 20 percent seat. For additional information, refer to Seat — Second Row, 20 Percent in this section.

2. Remove the 20 percent seat backrest. For additional information, refer to Seat Backrest — Second Row, 20 Percent in this section.

3. Remove the safety belt guide cover.
   - Insert an appropriate tool into the holes and release the 3 locking tabs.
   - Detach the safety belt guide cover.
   - Route the safety belt webbing through the slot.

4. Remove the latch release handle bezel.
   - Release the upper tab and separate the bezel from the latch release handle.

5. **CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Separate the hook-and-loop strips and invert the backrest trim cover to the row of hog rings.

6. Remove the row of hog rings.

7. Continue inverting and remove the backrest trim cover.
   - Route the safety belt webbing through the trim cover opening.

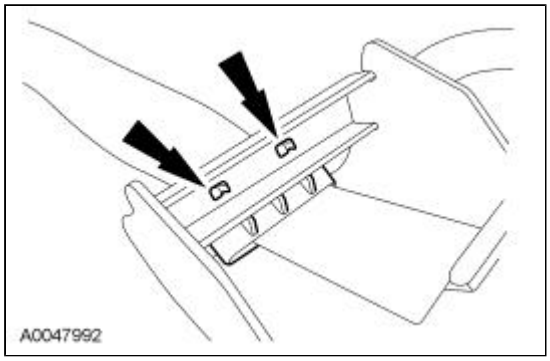
8. Remove the 2 pin-type retainers and foam pad.

9. Remove the safety belt retractor foam cover.

10. Remove the 2 screws and safety belt retractor cover.

11. Remove the safety belt retractor bolt.
    - To install, tighten to 40 Nm (30 lb-ft).

12. Release the 2 tabs and detach the safety belt retractor guide.



13. **NOTE:** Note safety belt routing for installation.

    NOTE: Make sure the safety belt webbing is not twisted prior to installation.

    Remove the safety belt retractor.
    - Route out the safety belt webbing, guide, tongue and anchor through the backrest frame.

14. Release the pin-type retainer and detach the release cable from the backrest frame.

15. **NOTE:** Note cable routing for installation.

    Remove the 2 screws and latch release handle.
    - Route out the release cable.

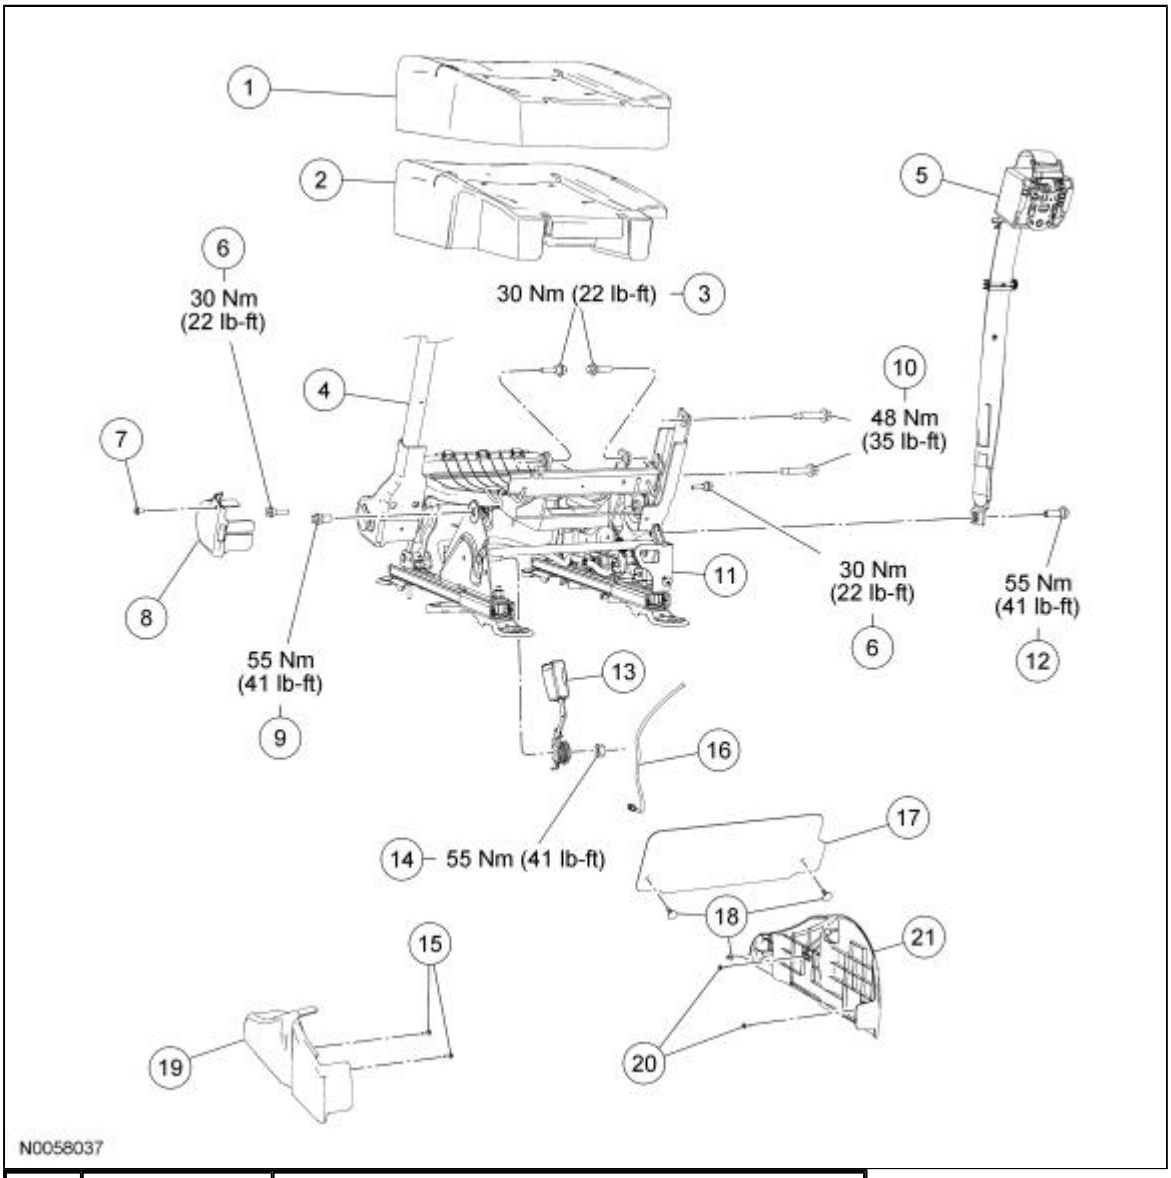
16. Remove the 2 pin-type retainers and 2 attaching straps.

17. Remove the 8 backrest support panel screws.

18. To assemble, reverse the disassembly procedure.
    - Verify the safety belt retractor operates without excessive effort or binding.

Seat Cushion — Second Row, 20 Percent

Printable View (179 KB)



Item	Part Number	Description
1	63804	Cushion trim cover
2	63840	Cushion foam pad
3	613F18	Swivel bolts
4	613A38	Backrest frame
5	611B64	Safety belt retractor
6	613F18	Seat riser-to-cushion frame bolts (2 required)
7	W504042	Screw, LH pivot bolt cover
8	62178	Pivot bolt cover
9	613F18	Pivot bolt
10	W506542	Backrest-to-cushion bolts (2 required)

11	63160	Cushion frame
12	—	Safety belt anchor bolt (part of 611B64)
13	60044	Safety belt buckle
14	N620483	Safety belt buckle nut
15	W704655	LH side shield screws (2 required)
16	—	Recliner cable
17	—	Lower panel
18	—	Pin-type retainers (3 required)
19	613A97	LH side shield
20	W704655	RH side shield screws (2 required)
21	63386	RH side shield

Disassembly and Assembly

1. Remove the 20 percent seat. For additional information, refer to Seat — Second Row, 20 Percent in this section.

2. Remove the 20 percent seat backrest. For additional information, refer to Seat Backrest — Second Row, 20 Percent in this section.

3. Remove the 2 screws and LH side shield.

4. Remove the nut and safety belt buckle.
    - To install, align the anti-rotation tab.
        - To install, tighten to 55 Nm (41 lb-ft).

5. Release the cushion trim cover front J-clip.

6. Remove the 2 riser-to-cushion frame bolts and cushion frame.
    - To install, tighten to 30 Nm (22 lb-ft).

7. Release the hook-and-loop strip and remaining cushion J-clips.

8. Remove the cushion frame from the foam pad and trim cover.

9. **CAUTION: Use care when separating the seat cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat cushion foam.**

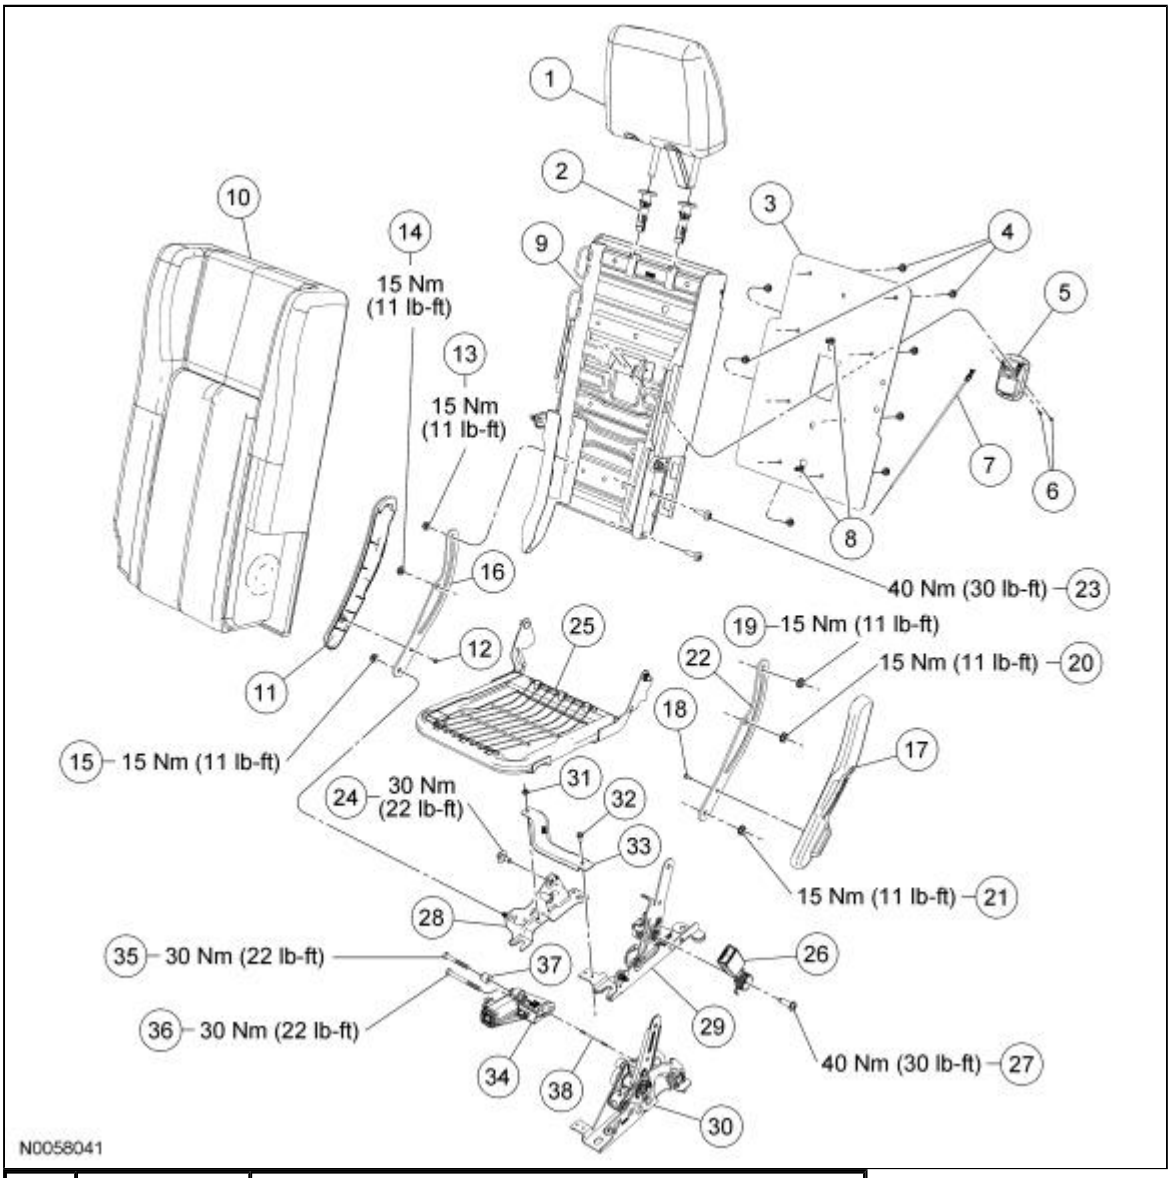
   Release the hook-and-loop strips and invert the cushion trim cover to the row of hog rings.

10. Remove the hog rings and cushion trim cover.

11. To assemble, reverse the disassembly procedure.

Seat Backrest — Third Row, 40 Percent

Printable View (261 KB)



Item	Part Number	Description
1	611A08	Head restraint assembly
2	610A16	Head restraint guides

25	63160	Cushion frame
26	60044	Safety belt buckle
27	N807750	Safety belt buckle bolt (part of 60044)
28	613D60	Outboard latch
29	613D61	Inboard manual latch
30	600M46	Inboard power latch
31	N620480	Nut, support bar
32	—	Bolt, support bar
33	—	Support bar
34	14547	Power-fold seat motor and bracket
35	—	Bolt, bracket-to-pivot (part of 14547)
36	—	Bolt, bracket-to-latch (part of 14547)
37	—	Bushing, power-fold seat motor (part of 14547)
38	—	Torque shaft, power-fold seat motor (part of 14547)

Disassembly and Assembly

All seats

1. Remove the third row 40 percent seat. For additional information, refer to Seat — Third Row in this section.

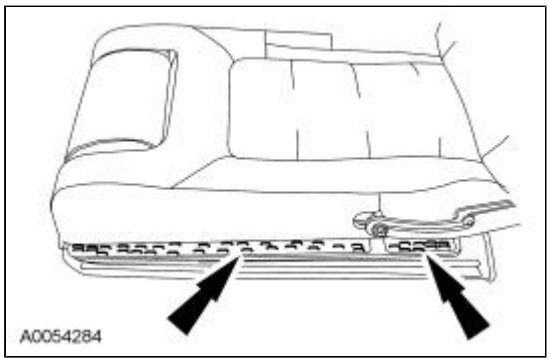
2. Remove the third row 40 percent seat backrest. For additional information, refer to Seat Backrest — Third Row, 40 Percent in this section.

3. Remove the bolt and the safety belt buckle.
    - During assembly make sure anti-rotation tab is engaged into seat locator.

- To install, tighten to 40 Nm (30 lb-ft).

4. Release the backrest trim cover outboard J-clip.

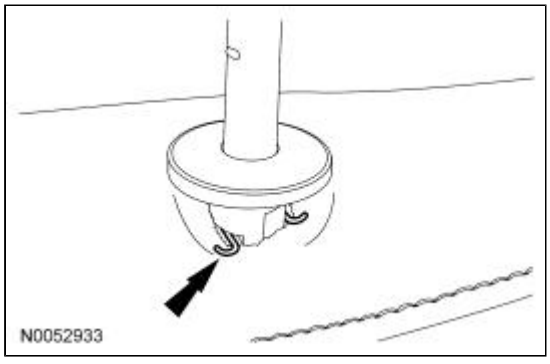
5. Remove all the staples.



6. **NOTE:** Note the spring clip position for installation.

   NOTE: Use care when releasing the spring clips. They can fall inside the backrest frame.

   Remove the head restraint.
   - Pull the trim cover material away from the head restraint guide to access the spring clips.
   - Release the 2 spring clips by pushing on the side shown.
   - Raise and remove the head restraint.



Manual seat

7. **NOTE:** Note cable routing for installation.

   Remove the 2 screws and the manual latch handle and cable assembly.
   - Route out the cable.

All seats

8. **NOTE:** The head restraint guides are not interchangeable. Note location for installation.

   Reach up into backrest and squeeze the head restraint guide ends together to release and pull the 2 head restraint guides out.

9. **CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

Separate the hook-and-loop strips and invert the backrest trim cover to the row of hog rings.

10. Remove the row of hog rings and backrest trim cover.

11. Remove the nut, screw and support bracket.

12. Remove the 2 inboard latch-to-backrest frame bolts and the inboard latch.
    - To install, tighten to 40 Nm (30 lb-ft).

13. Remove the outboard latch-to-cushion frame bolt and the outboard latch.
    - To install, tighten to 30 Nm (22 lb-ft).

14. Remove the 6 screws and the backrest support panel.

15. To assemble, reverse the disassembly procedure.

Seat Backrest — Third Row, 60 Percent

Printable View (286 KB)

Disassembly and Assembly

All seats

1. Remove the third row 60 percent seat. For additional information, refer to Seat — Third Row in this section.

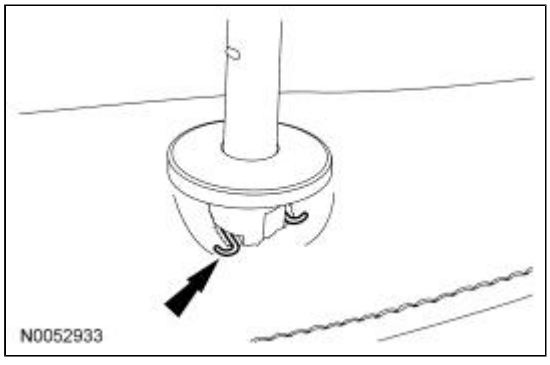
2. Remove the third row 60 percent seat backrest. For additional information, refer to Seat Backrest — Third Row, 60 Percent in this section.

3. Remove the safety belt anchor bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

4. **NOTE:** Note the spring clip position for installation.

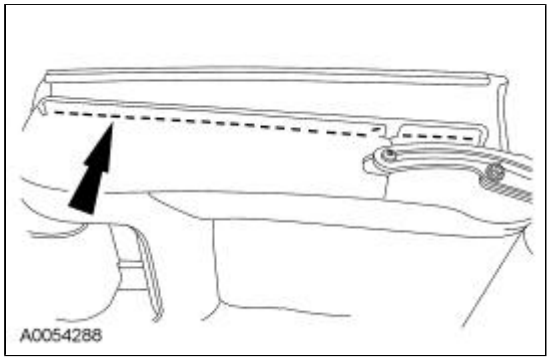
   NOTE: Use care when releasing the spring clips. They can fall inside the backrest frame.

   Remove the head restraint.
   - Pull the trim cover material away from the head restraint guide to access the spring clips.
   - Release the 2 spring clips by pushing on the side shown.
   - Raise and remove the head restraint.



5. Release all the backrest trim cover J-clips.

6. Remove all the staples.



7. Release the hook-and-loop strip.

Manual seat

8. **NOTE:** Note cable routing for installation.

   Remove the 2 screws and the manual latch handle and cable assembly.
   - Route out the cable.

All seats

9. Remove the safety belt guide cover.

10. **NOTE:** The head restraint sleeve pins are not interchangeable. Note location for installation.

    Reach up into the backrest and squeeze the head restraint guide ends together to release and pull the 2 head restraint guides out.

11. **CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

    Separate the hook-and-loop strips and invert the backrest trim cover to the row of hog rings.

12. Remove the row of hog rings.

13. Remove the trim cover.
    - Route the safety belt webbing through the trim cover.

14. Remove the backrest foam pad.

15. Remove the nut, screw and support bracket.

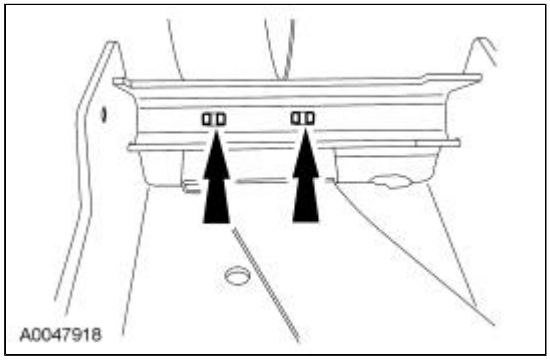
16. Remove the outboard latch-to-cushion frame bolt and outboard latch.
    - To install, tighten to 35 Nm (26 lb-ft).

17. Remove the 2 inboard latch-to-backrest frame bolts and the inboard latch.
    - To install, tighten to 55 Nm (41 lb-ft).

18. Remove the 4 screws and the safety belt retractor cover.

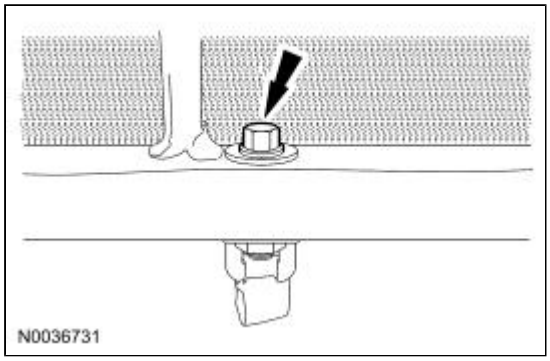
19. Remove the safety belt retractor bolt.
    - To install, tighten to 40 Nm (30 lb-ft).

20. Pinch to release the safety belt guide and remove the safety belt retractor.
    - Route through the backrest frame.



21. Remove the 15 screws and the backrest support panel.

22. Remove the bolt and child safety seat tether anchor.
    - To install, tighten to 15 Nm (11 lb-ft).

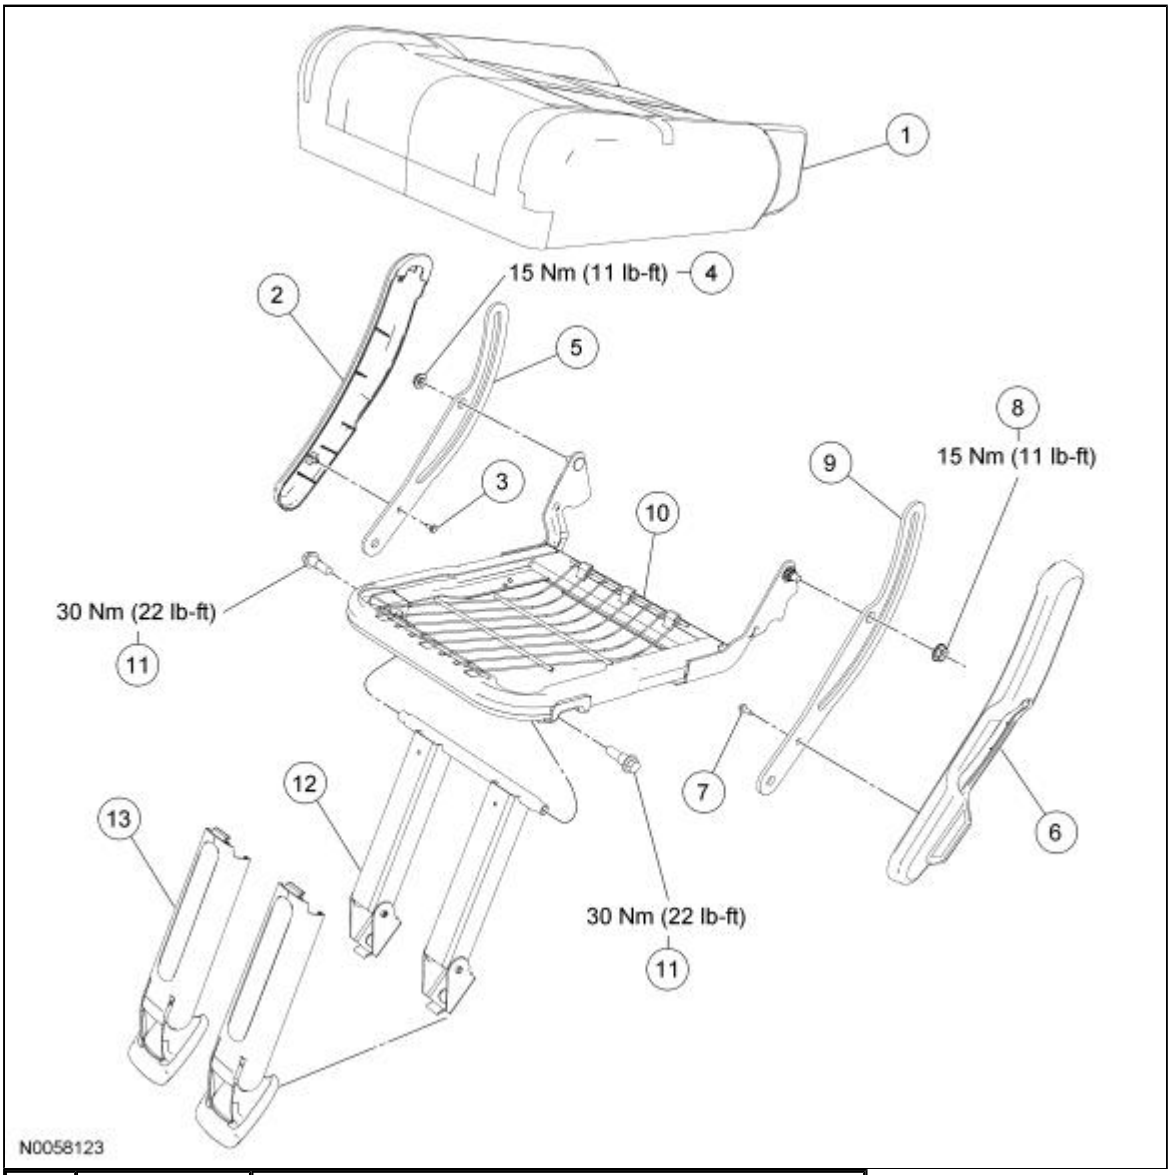


23. To assemble, reverse the disassembly procedure.

Seat Cushion — Third Row, 40 Percent

Printable View (191 KB)

40 Percent Cushion



Item	Part Number	Description
1	63804/63840	Cushion trim cover/foam pad
2	624C32	Outboard slide bracket cover
3	W708686	Outboard slide bracket cover-to-outboard slide bracket screw
4	613F18	Outboard slide bracket-to-cushion frame nut
5	624C30	Outboard slide bracket
6	624C33	Inboard slide bracket cover
7	W708686	Inboard slide bracket cover-to-inboard slide

		bracket screw
8	613F18	Inboard slide bracket-to-cushion frame nut
9	624C30	Inboard slide bracket
10	63160	Cushion frame
11	613F18	Riser-to-cushion frame bolts (2 required)
12	613E52	Riser
13	666C00	Riser covers (2 required)

Disassembly and Assembly

1. Remove the third row 40 percent seat. For additional information, refer to Seat — Third Row in this section.

2. Remove the third row 40 percent seat backrest. For additional information, refer to Seat Backrest — Third Row, 40 Percent in this section.

3. Remove the inboard and outboard slide bracket-to-cushion frame nuts and remove the slide bracket from both sides of the seat cushion.
   - To install, tighten to 15 Nm (11 lb-ft).

4. Remove the 2 seat riser-to-cushion frame bolts and the riser.
   - To install, tighten to 30 Nm (22 lb-ft).

5. Release the cushion trim cover J-clips and remove the cushion frame.

6. **CAUTION: Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

   Separate the hook-and-loop strips and invert the trim cover to the row of hog rings.

7. Remove the row of hog rings and remove the trim cover.

8. To assemble, reverse the disassembly procedure.

Glass, Frames and Mechanisms

Printable View (68 KB)

The glass, frames and mechanisms consist of the:

- front door window glass.
- front door window motor.
- front door window regulator.
- rear quarter window glass.
- rear quarter window glass frame.
- rear quarter motor and window regulator.
- rear door window glass.
- rear door window motor.
- rear door window regulator.
- liftgate glass.
- windshield glass.

The glass, frames and mechanisms include:

- standard plastic and laminate safety glass.
- liftgate glass which houses the rear defrost grid and rear wiper arm.
- windshield glass which is bonded to the opening flange with a urethane sealant.
- on Expedition, standard power windows which include one-touch down (LF only) and lock out feature.
- on Navigator, standard power windows which include one-touch up/down (LF and RF only) and lock out feature.
- power vented rear quarter windows.
- fixed rear quarter windows (Expedition only).
- RH quarter window glass antenna.

The window regulator control switch:

- is located on each door trim panel.
- may be used to raise or lower all windows from the master control on the driver side, or the individual side window from the individual door switch.
- on Expedition, includes a one-touch down double detent feature (LF only).
- on Navigator, includes a one-touch up and one-touch down double detent feature (LF and RF).
- can manually lower the driver side window when the master control is depressed halfway (first detent).
- will completely lower the driver side window when the master control is fully depressed and then released (second detent).
- on Navigator, will completely raise the driver side window when the master control is pulled up and then released (second detent).
- on Navigator, will completely lower the passenger front window when the RF control switch is fully depressed and then released (second detent).
- on Navigator, will completely raise the passenger front window when the RF control switch is pulled up and then released (second detent).
- can lock out passenger front (Expedition only) and rear control switches.

The rear quarter glass regulator control switches:

- are located in the overhead console.
- may be used to open and close the RH or LH rear quarter windows.
- stop the rear quarter glass in any position when released.

The power window system will operate if the ignition switch is in the RUN or ACC position, or the delayed accessory feature is active.

Passenger windows may be raised or lowered using the LF master control switches or the appropriate passenger window switch. Passenger window switches receive power when the delayed accessory relay is active and the LF remote lock-out switch is in the UNLOCK position. When in the LOCK-OUT position, the passenger windows are deactivated (Expedition only). When in the lock-out position, the rear windows are deactivated (Navigator only).

The delayed accessory relay provides power for the operation of the power windows and the power moon roof. For Navigator front windows, the delayed accessory relay provides a low current signal to allow window movement. The delayed accessory feature is active when the ignition switch is in the RUN or the ACC position, or when the ignition switch is changed from RUN or ACC to the OFF/LOCK position and the LF and RF doors are closed.

The delayed accessory feature will deactivate when:

- the LF door is ajar and the ignition switch is in the OFF/LOCK or KEY-OUT position.
- the RF door is ajar and the ignition switch is in the OFF/LOCK or KEY-OUT position.
- 10 minutes have elapsed since the ignition switch was changed from ACC or RUN to the OFF/LOCK position.

Feature inputs:

- LF door open warning switch (open circuit with door closed, grounded with door ajar)
- RF door open warning switch (open circuit with door closed, grounded with door ajar)
- Ignition switch RUN position (battery potential on both the RUN and RUN/ACC inputs)
- Ignition switch ACC position (battery potential on the RUN/ACC input)
- Ignition switch OFF/LOCK position (absence of battery potential on the RUN, RUN/ACC and START inputs)

Feature outputs:

- Delayed accessory relay (grounded when activated, open circuit when deactivated)

The electronic automatic temperature control module (EATC) or electronic manual temperature control (EMTC) controls the state of the rear window defrost/mirror relay. When the rear window defrost switch is pressed, the EATC or EMTC will activate the heated grid relay. When the heated grid relay is active, both the rear window defrost grid and heated mirror elements will be energized.

The EATC or EMTC will deactivate the heated grid relay when one of the following conditions is met:

- The rear window defrost switch is pressed when the feature is active
- Ignition switch state is changed from RUN to OFF/LOCK
- The 10 minute timing function is completed

Feature inputs:

- Ignition switch RUN position (12V on both RUN and RUN/ACC inputs)
- Rear window defrost switch (momentary contact to ground when switch is pressed)

Feature outputs:

- Rear window defrost relay control (grounded when activated, open circuit when deactivated)

Principles of Operation

Navigator — One-Touch Up/Down, Front Windows

NOTE: The LF and RF window motors are not on the multiplex link.

The LF and RF window motors have 8 pins and contain integral electronics. The master window control switch sends 3 separate signals to the LF or RF window motor (the passenger window control switch sends 3 separate signals to the RF window motor only): UP, DOWN and AUTO. The master window control switch or passenger window control switch provide a 12-volt signal to the motor to request an up or down operation. When AUTO up or AUTO down are requested, the window control switch provides a 12-volt signal on the UP or DOWN line and a ground signal on the AUTO line simultaneously. The UP, DOWN and AUTO contacts are floating within the front control switches (LF, RF) when the switches are in the NEUTRAL position. The LF and RF window motors pull the UP and DOWN inputs to ground and the AUTO input to 12 volts when the wire harness is connected to the motor and signals are not being provided by the window switches. The up, down and auto feeds to the motor are all low current.

The window motor plastic pinion gear is mated to the drum housing of a dual rail drum and cable window regulator. The motor is attached to the drum housing (plastic) by 3 screws. The motor uses internal Hall-effect sensor feedback coupled to the microprocessor to determine window position and operate the window. If the Hall-effect pulses are not being received by the microprocessor, the motor will run for approximately 1/10 second each switch press. The motor contains a thermal breaker to protect the motor windings from overcurrent/overtemperature operation. Continued successive operation of the motor will cause the thermal breaker to open, causing a loss of function until the motor cools.

The window motor operates with the ignition switch in the RUN/ACC positions only (and delayed accessory) and is sensed via the delayed accessory input. The motor is supplied with B+ power and draws a key-off load of approximately 3/4 mA. All of the high current required to move the window is supplied through the B+ and motor ground inputs. The loss of motor ground will cause this system to become inoperative. For correct functionality, both power feeds and the ground feed must be intact at the motor.

During an auto up or auto down function, movement of the window can be stopped by actuating the switch to any position (UP, DOWN, AUTO up, AUTO down). The switch must then be released before the window will perform the next commanded movement.

When an obstacle has been detected in the window opening as the window is moving upward, the window will automatically reverse direction and move toward the fully open position (in both proportional up and one-touch up modes). This is known as "bounce-back". Once the window stops at its bounce-back position, and within 2 seconds the switch is released, then held in the AUTO UP position, the window will travel up with no bounce-back protection (security override). If the switch is released before the window reaches fully closed, the window will stop with bounce-back automatically re-enabled for the next window up movement. If the ignition switch is turned to OFF or START (without delayed accessory), the window will stop. The only exception is when an obstacle is detected while delayed accessory is lost. In this case the window will bounce back, then stop. Ice, contaminant buildup and environmentally induced tight spots in the window seals are all possible uses for the security override feature.

If an obstruction occurs while the window is moving up, the window will bounce back 125 mm (4.9 in) from where the obstruction occurs. If an obstruction occurs when the window is 125 mm (4.9 in) or less from the DOWN position, the bounce back position will be the full DOWN position.

The LF and RF window motor will retain its initialization (memory) if power (B+) is removed while the window is not in motion. If power (B+) is disconnected from the LF or RF window motor while the window is in motion, the motor will enter position recovery mode when power is restored (AUTO up and AUTO down functions are disabled). Position recovery mode allows proportional down (and up) movement of the window until the window motor stalls the window glass in the full DOWN position. If no internal or external faults are present, the motor will automatically resume normal (full) operation.

The master window control switch and passenger window control switch are supplied with illumination power and illumination ground inputs used to illuminate the switch when the headlamp switch is turned to the PARK or ON position (the AUTOLAMP position may also energize this input). These switch inputs do not directly affect operation of the LF or RF window. The master window control switch and passenger window control switch use the delayed accessory power input which is transferred to the UP or DOWN outputs via closing of a switch contact. The master window control switch and passenger window control switch each have separate ground switch inputs which are transferred to the auto output via closing of a switch contact. If the delayed accessory feed to the window control switch is missing, none of the windows will function. If the master window control switch ground signal is missing, the auto functions will be inoperative and the LR and RR windows will also be inoperative. The RF window auto functions will still operate correctly from the passenger window control switch as long as the ground feed to that switch is present.

If the window control switch, or its associated wiring, develops an open circuit, that function will become inoperative. If the UP contact or associated wiring develops an open circuit, the window will only move down or one-touch down. If the DOWN contact or associated wiring develops an open circuit, the window will only move up or one-touch up. If the auto contact or associated wiring develops an open circuit, the window will only move proportionally up or down.

The window motor will suspend window operation if a switch error exists. A switch error is defined as UP and DOWN, AUTO without UP or DOWN, or UP and DOWN and AUTO energized at the same time. The window will appear to be inoperative if a switch error is present.

A new LF or RF window motor will be in proportional up/down mode prior to initialization. The motor will respond to a proportional UP or DOWN switch actuation only and bounce back is disabled. If the switch is actuated to the AUTO up or AUTO down position and released, window movement will stop when the UP or DOWN contact in the master window control switch or passenger window control switch is released. If the window motor is removed from the window regulator drum housing, or if a new window motor is installed, the window motor must be initialized. Refer to Window Motor Initialization in the General Procedures portion of this section.

The window motor will automatically adjust to system changes throughout its life: changes in seal drag and slight changes in the fully open position will occur and are automatically compensated for. Once initialized, for the most part, the window motor will soft stall into the lower position contributing to extended durability of the system. If the window does not seal completely in the full up position, the window switch can be actuated to the proportional up position and the window will be energized long enough to fully seal. If the window does not travel fully down, the window switch can be activated to the proportional DOWN position and the window will be energized long enough to travel to the full DOWN position. In both cases, the new positions will be learned.

Expedition — One-Touch Down

The one-touch down feature for the Expedition is controlled by the master window control switch.

Rear Window Defrost

When the rear window defrost switch is pressed, the electronic automatic climate control (EATC) or electronic manual temperature control (EMTC) will activate the heated backlight relay located in the battery junction box (BJB). When the heated backlight relay is active, the heated backlight will be energized.

Inspection and Verification

1. Verify the customer concern by operating the power window system.

2. Visually inspect for obvious signs of mechanical and electrical damage. Refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical

• Window regulator assembly
• Window glass
• Window control switch
	• Central junction box (SJB) circuit breaker 47 (30A)
	• Delayed accessory relay
	• SJB fuse(s):
	  ▪ 1 (30A)
	  ▪ 4 (30A)
	  ▪ 41 (15A)
	• Circuitry
	• Window control switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** The Navigator front window motors are not on the multiplex link.

   NOTE: Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the smart junction box (SJB).

7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.

9. If the DTCs retrieved are related to the concern, go to Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1302	Accessory Delay Relay Coil Circuit Failure	If the accessory delay is always on, Go To Pinpoint Test N . If the accessory delay is inoperative, Go To Pinpoint Test M .
B1304	Accessory Delay Relay Coil Circuit Short To Battery	Go To Pinpoint Test N .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• All power windows are inoperative — Expedition	• Circuit breaker • Fuse • Delayed accessory relay • Circuitry • Master window control switch	• Go To Pinpoint Test A .
• All power windows are inoperative — Navigator	• Delayed accessory relay	• Go To Pinpoint Test M .
• A single power window is inoperative — LF, Expedition	• Circuitry • Master window control switch • LF power window motor	• Go To Pinpoint Test B .
• A single power window is inoperative — LF, Navigator	• Fuse(s) • Circuitry • Master window control switch • LF power window motor	• Go To Pinpoint Test C .

• A single power window is inoperative — LF or RF power window will not close (bounces back), Navigator	• The window system was repaired and the LF or RF motor was not reinitialized	• REINITIALIZE the LF or RF motor. REFER to Window Motor Initialization .
	• Glass runs are not fully seated	• Carefully use a rubber mallet to reseat the glass runs, then REINITIALIZE the LF or RF motor. REFER to Window Motor Initialization .
	• Dirt or contaminants are present in the glass runs or beltline moulding	• REMOVE/CLEAN the glass runs or beltlines, then REINITIALIZE the LF or RF motor. REFER to Window Motor Initialization .
	• Binding in the inner/outer beltline moulding	• REMOVE and REINSTALL the inner/outer beltlines, INSTALL new if necessary, then REINITIALIZE the LF or RF motor. REFER to Window Motor Initialization .
	• Window regulator is out of position	• Using the security override function, POSITION the glass in the full UP position. REFER to the Description and Operation portion of this section. LOOSEN the 4 window regulator rail bolts. TIGHTEN the 4 window regulator rail bolts. REINITIALIZE the LF or RF motor. REFER to Window Motor Initialization .
	• Front glass channel (lower portion) is out of position	• LOWER the glass to the full DOWN position. LOOSEN the glass channel bolt. TIGHTEN the glass channel bolt. REINITIALIZE the LF or RF motor. REFER to Window Motor Initialization .
	• Window system components are loose	• CHECK the torque on the LF or RF motor screws, window glass to regulator bolts, regulator rail bolts, glass channel bolt and the door carrier fasteners. REINITIALIZE the LF or RF motor. REFER to Window Motor Initialization .
• A single power window is inoperative — RF, Expedition	• Circuitry • Master window control switch • RF window control switch • RF power window motor	• Go To Pinpoint Test D .

Pinpoint Tests

Pinpoint Test A: All Power Windows are Inoperative — Expedition

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

Power is sent to the master window control switch through circuit CBP47 (GN/BU) from the accessory delay relay. The master window control switch is grounded through circuit GD143 (BK/VT).

Possible Causes

- Circuit breaker
- Open in circuit CBP47 (GN/BU) or GD143 (BK/VT)
- Window control switch

CAUTION: Be careful when probing the SJB, battery junction box or any connectors. Damage will result to the connector receptacle if the probe being used is too large.

PINPOINT TEST A: ALL POWER WINDOWS ARE INOPERATIVE — EXPEDITION

Test Step	Result / Action to Take
A1 CHECK CIRCUIT CBP47 (GN/BU) FOR VOLTAGE	**Yes** GO to A3 . **No** GO to A2 .
• Disconnect: Master Window Control Switch C504A. • Key in ON position. • Measure the voltage between master window control switch C504A-2, circuit CBP47 (GN/BU) and ground.  N0054111 • **Is the voltage greater than 10 volts?**	
A2 CHECK CIRCUIT CBP47 (GN/BU) FOR AN OPEN	**Yes** Go To Pinpoint Test M to diagnose the accessory delay relay system.
• Key in OFF position. • Disconnect: Accessory Delay Relay. • Measure the resistance between master window control switch C504A-2, circuit CBP47 (GN/BU) and accessory delay relay socket pin 87.	

 N0054112 • **Is the resistance less than 5 ohms?**	**No** VERIFY the smart junction box (SJB) circuit breaker 47 (30A) is OK. If OK, REPAIR circuit CBP47 (GN/BU) for an open. TEST the system for normal operation.
A3 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN	
• Key in OFF position. • Disconnect: Master Window Control Switch C504B. • Measure the resistance between master window control switch C504B-7, circuit GD143 (BK/VT) and ground.  N0054113 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new master window control switch. REFER to Window Control Switch in this section. **No** REPAIR circuit GD143 (BK/VT) for an open. TEST the system for normal operation.

Pinpoint Test B: A Single Power Window is Inoperative — LF, Expedition

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the master window control switch provides power to the power window motor through circuit CPW10 (YE/VT) and ground through circuit CPW11 (BU/GY) to operate the driver window down, and power through circuit CPW11 (BU/GY) and ground through circuit CPW10 (YE/VT) to operate the driver window up.

Possible Causes

- Open in circuit CPW10 (YE/VT) or CPW11 (BU/GY)
- Window control switch
- Front door window regulator motor

PINPOINT TEST B: A SINGLE POWER WINDOW IS INOPERATIVE — LF, EXPEDITION

Test Step	Result / Action to Take
B1 CHECK THE POWER WINDOW SWITCH	
• Key in ON position. • Disconnect: Master Window Control Switch C504A and C504B. • Connect a fused jumper wire between C504B-7, circuit GD143 (BK/VT) and C504A-1, circuit CPW10 (YE/VT) and connect a second fused jumper wire between C504A-2, circuit CBP47 (GN/BU) and C504A-5, circuit CPW11 (BU/GY). The window should operate in the up direction.  N0054114 • Connect a fused jumper wire between C504B-7, circuit GD143 (BK/VT) and C504A-5, circuit CPW11 (BU/GY) and connect a second fused jumper wire between C504A-2, circuit CBP47 (GN/BU) and C504A-1, circuit CPW10 (YE/VT). The window should operate in the down direction.  N0054115 • **Does the window operate correctly?**	**Yes** INSTALL a new master window control switch. REFER to Window Control Switch in this section. **No** GO to B2.
B2 CHECK CIRCUIT CPW10 (YE/VT) FOR AN OPEN	
• Key in OFF position. • Disconnect: LF Power Window Motor C518. • Measure the resistance between power window motor C518-1, circuit CPW10 (YE/VT) harness side, and master window control switch C504A-1, circuit CPW10 (YE/VT) harness side.	**Yes** GO to B3. **No** REPAIR circuit CPW10 (YE/VT) for an open. TEST the system for normal operation.

 N0054116 • **Is the resistance less than 5 ohms?**	
B3 CHECK CIRCUIT CPW11 (BU/GY) FOR AN OPEN • Measure the resistance between LF power window motor C518-2, circuit CPW11 (BU/GY) harness side, and master window control switch C504A-5, circuit CPW11 (BU/GY) harness side.  N0054117 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new LF window regulator motor. REFER to Window Regulator Motor — Front Door . TEST the system for normal operation. **No** REPAIR the circuit CPW11 (BU/GY) for an open. TEST the system for normal operation.

Pinpoint Test C: A Single Power Window is Inoperative — LF, Navigator

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the LF power window motor microprocessor receives power at all times through circuit SBP01 (RD) and from the accessory delay relay through circuit CBP41 (BU). Ground is provided at all times through circuit GD143 (BK/VT). The master window control switch provides voltage input to the power window motor microprocessor through circuit CPW10 (YE/VT) to operate the driver window down, and voltage input through circuit CPW11 (BU/GY) to operate the driver window up.

Possible Causes

- Fuse(s)
- Open in circuit SBP01 (RD), CPB41 (BU), CPW11 (BU/GY), CPW10 (YE/VT), CPW29 (VT/GY) or GD143 (BK/VT)
- Window control switch
- Front door window regulator motor

PINPOINT TEST C: A SINGLE POWER WINDOW IS INOPERATIVE — LF, NAVIGATOR

NOTE: The LF power window motor is not on the multiplex link.

NOTE: A new LF power window motor will be in proportional up/down mode until initialized. Refer to Window Motor Initialization in this section.

NOTE: The LF power window motor must be reinitialized whenever: the motor is removed from the window regulator drum housing, a new motor is installed, a new window regulator is installed, a new window glass is installed, a new top run is installed and any operation in which grease or lubricants are applied to the window system.

Test Step	Result / Action to Take
C1 CHECK THE POWER TO THE WINDOW MOTOR • Key in OFF position. • Disconnect: LF Window Power Window Motor C540. • Measure the voltage between LF power window motor C540-3, circuit SBP01 (RD) harness side and ground.  N0054118 • **Is the voltage greater than 10 volts?**	**Yes** GO to C2 . **No** VERIFY the SJB fuse 1 (30A) is OK. If OK, REPAIR circuit SBP01 (RD) for an open. REINITIALIZE the LF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
C2 CHECK THE LF WINDOW MOTOR DELAYED ACCESSORY FEED • Key in ON position. • Measure the voltage between LF power window motor C540-2, circuit CBP41 (BU) harness side and ground.  N0054119 • **Is the voltage greater than 10 volts?**	**Yes** GO to C3 . **No** VERIFY SJB fuse 41 (15A) is OK. If OK, REPAIR circuit CPB41 (BU) for an open. REINITIALIZE the LF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
C3 CHECK THE LF MOTOR GROUND • Key in OFF position. • Open the front door to disable delayed accessory power. • Measure the resistance between LF power window motor C540-8, circuit GD143 (BK/VT) harness side and ground.  N0057830 • **Is the resistance less than 5 ohms?**	**Yes** GO to C4 . **No** REPAIR circuit GD143 (BK/VT) for an open. REINITIALIZE the LF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.

C4 CHECK THE FRONT WINDOW SWITCH TO LF MOTOR FEEDS	
• Disconnect: Master Window Control Switch C535A. • Measure the resistance between LF power window motor C540-7, circuit CPW11 (BU/GY) and master window control switch C535A-4, circuit CPW11 (BU/GY); C540-4, circuit CPW10 (YE/VT) and C535A-7, circuit CPW10 (YE/VT); C540-6, circuit CPW29 (VT/GY) and C535A-8, circuit CPW29 (VT/GY) harness side.  N0054121 • **Are the resistances less than 5 ohms?**	**Yes** GO to C5 . **No** REPAIR circuit CPW11 (BU/GY), circuit CPW10 (YE/VT) or circuit CPW29 (VT/GY) for an open. REINITIALIZE the LF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
C5 CHECK THE MASTER WINDOW CONTROL SWITCH	
• Carry out the window control switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the window control switch pass the component test?**	**Yes** INSTALL a new LF power window motor. REFER to Window Regulator Motor — Front Door in this section. REINITIALIZE the LF door window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation. **No** INSTALL a new master window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation.

Pinpoint Test D: A Single Power Window is Inoperative — RF, Expedition

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the RF window control switch receives power from the master window control switch through circuit CPW30 (GY/YE). The RF window control switch provides power to the power window motor through circuit CPW20 (WH/OG) and ground through circuit CPW19 (VT) to operate the passenger front window up, and power through circuit CPW19 (VT) and ground through circuit CPW20 (WH/OG) to operate the passenger front window down.

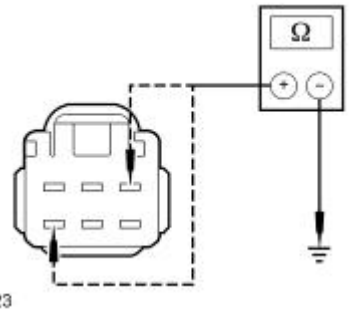
When operating the passenger front window using the master window control switch, power is sent to the RF window control switch through circuit CPW12 (GN/OG) and ground through circuit CPW13 (BN/YE) to operate the passenger front window up, and power through circuit CPW13 (BN/YE) and ground through circuit CPW12 (GN/OG) to operate the passenger front window down.

Possible Causes

- Open in circuit CPW30 (GY/YE), CPW19 (VT) or CPW20 (WH/OG)
- Open or short to ground in circuit CPW13 (BN/YE) or CPW12 (GN/OG)
- Window control switch
- Front door window regulator motor

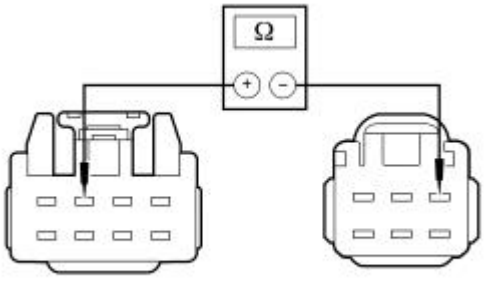
PINPOINT TEST D: A SINGLE POWER WINDOW IS INOPERATIVE — RF, EXPEDITION

Test Step	Result / Action to Take
D1 CHECK THE VOLTAGE TO THE PASSENGER WINDOW REGULATOR CONTROL SWITCH	
• Disconnect: RF Window Control Switch C624. • Key in ON position. • **NOTE:** Set the window lock switch to the UNLOCK position. • Measure the voltage between RF window control switch C624-3, circuit CPW30 (GY/YE) and ground.  N0054122 • **Is the voltage greater than 10 volts?**	**Yes** GO to D2 . **No** REPAIR circuit CPW30 (GY/YE) for an open. TEST the system for normal operation.
D2 CHECK CIRCUITS CPW13 (BN/YE) AND CPW12 (GN/OG) FOR CONTINUITY TO GROUND	

• Key in OFF position.
• Measure the resistance between ground and RF window control switch C624:
  ▪ pin 1, circuit CPW13 (BN/YE).
  ▪ pin 6, circuit CPW12 (GN/OG).
  	


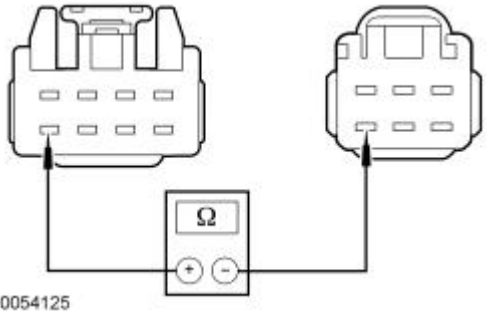
N0054123
• **Are the resistances less than 5 ohms?**
	Yes
	GO to D4 .
	
	No
	GO to D3 .

D3 CHECK CIRCUITS CPW13 (BN/YE) AND CPW12 (GN/OG) FOR AN OPEN	
• Disconnect: Master Window Control Switch C504A. • Measure the resistance between master window control switch C504A-3, circuit CPW13 (BN/YE) and RF window control switch C624-1, circuit CPW13 (BN/YE) harness side.	**Yes** INSTALL a new master window control switch.



N0054124

- Measure the resistance between master window control switch C504A-8, circuit CPW12 (GN/OG) and RF window control switch C624-6, circuit CPW12 (GN/OG) harness side.



N0054125

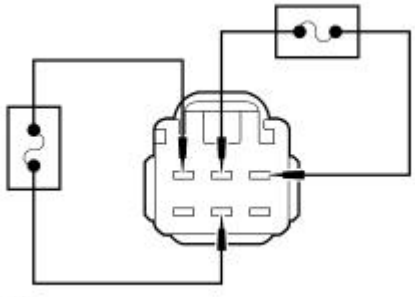
- **Is the resistance less than 5 ohms?**

REFER to Window Control Switch . TEST the system for normal operation.

No
REPAIR circuit CPW13 (BN/YE) or CPW12 (GN/OG) for an open. TEST the system for normal operation.

D4 CHECK THE RF POWER WINDOW SWITCH

- Key in ON position.
- Connect a fused jumper wire between C624-1, circuit CPW13 (BN/YE) and C624-2, circuit CPW19 (VT) and connect a second fused jumper wire between C624-3, circuit CPW30 (GY/YE) and C624-5, circuit CPW20 (WH/OG). The window should operate in the up direction.

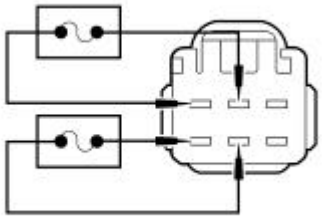


N0054126

- Connect a fused jumper wire between C624-6, circuit CPW12 (GN/OG) and C624-5, circuit CPW20 (WH/OG) and connect a second fused jumper wire between C624-3, circuit CPW30 (GY/YE) and C624-2, circuit CPW19 (VT). The window should operate in the down direction.

Yes
INSTALL a new RF window regulator control switch. REFER to Window Control Switch . TEST the system for normal operation.

No
GO to D5 .



N0054127

- **Does the window operate correctly?**

D5 CHECK CIRCUITS CPW19 (VT) AND CPW20 (WH/OG) FOR AN OPEN	
• Key in OFF position. • Disconnect: RF Window Motor C608. • Measure the resistance between RF window control switch C624-2, circuit CPW19 (VT) harness side, and between and RF window motor C608-1, circuit CPW19 (VT) harness side.  N0054128 • Measure the resistance between RF window control switch C624-5, circuit CPW20 (WH/OG) harness side, and between and RF window motor C608-2, circuit CPW20 (WH/OG) harness side.  N0054129 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new RF window regulator motor. REFER to Window Regulator Motor — Front Door . TEST the system for normal operation. **No** REPAIR circuit CPW19 (VT) or CPW20 (WH/OG) for an open. TEST the system for normal operation.

Pinpoint Test E: A Single Power Window is Inoperative — RF, Navigator

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the RF power window motor microprocessor receives power at all times through circuit SBP04 (GN/RD) and from the accessory delay relay through circuit CBP41 (BU). Ground is provided at all times through circuit GD138 (BK/WH). The master window control switch or passenger window control switch provides a voltage input to the power window motor microprocessor through circuit CPW19 (VT) to operate the RF window down, and voltage input through circuit CPW20 (WH/OG) to operate the RF window up.

Possible Causes

- Fuse(s)
- Open in circuit SBP04 (GN/RD), CPB41 (BU), CPW20 (WH/OG), CPW19 (VT), CPW31 (GN/WH) or GD138 (BK/WH)
- Window control switch
- Front door window regulator motor

PINPOINT TEST E: A SINGLE POWER WINDOW IS INOPERATIVE — RF, NAVIGATOR

NOTE: The RF power window motor is not on the multiplex link.

NOTE: A new RF power window motor will be in proportional up/down mode until initialized. Refer to Window Motor Initialization in this section.

NOTE: The RF power window motor must be reinitialized whenever: the motor is removed from the window regulator drum housing, a new motor is installed, a new window regulator is installed, a new window glass is installed, a new top run is installed and any operation in which grease or lubricants are applied to the window system.

Test Step	Result / Action to Take
E1 CHECK THE MASTER WINDOW CONTROL SWITCH OPERATION	
• Attempt to operate the RH window using the master window control switch. • **Does the RH window operate when using the master window control switch?**	**Yes** GO to E7. **No** GO to E2.
E2 CHECK THE POWER TO THE WINDOW MOTOR	
• Key in OFF position. • Disconnect: RF Window Power Window Motor C646. • Measure the voltage between RF power window motor C646-3, circuit SBP04 (GN/RD) harness side and ground.  N0054118 • **Is the voltage greater than 10 volts?**	**Yes** GO to E3. **No** VERIFY the SJB fuse 4 (30A) is OK. If OK, REPAIR circuit SBP04 (GN/RD) for an open. REINITIALIZE the RF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
E3 CHECK THE RF WINDOW MOTOR DELAYED ACCESSORY FEED	
• Key in ON position. • Measure the voltage between RF power window motor C646-2, circuit CBP41 (BU) harness side and ground.	**Yes** GO to E4. **No** VERIFY SJB fuse 41 (15A) is OK. If OK, REPAIR circuit CBP41 (BU) for an open. REINITIALIZE the RF power window motor.

 N0054119 • **Is the voltage greater than 10 volts?**	REFER to Window Motor Initialization in this section. TEST the system for normal operation.
E4 CHECK THE RF MOTOR GROUNDS	
• Key in OFF position. • Open the front door to disable delayed accessory power. • Measure the resistance between RF power window motor C646-8, circuit GD138 (BK/WH) harness side and ground.  N0057830 • **Is the resistance less than 5 ohms?**	**Yes** GO to E5 . **No** REPAIR circuit GD138 (BK/WH) for an open. REINITIALIZE the RF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
E5 CHECK THE FRONT WINDOW SWITCH TO RF MOTOR FEEDS	
• Disconnect: Master Window Control Switch C535A. • Measure the resistance between RF power window motor C646-7, circuit CPW20 (WH/OG) and master window control switch C535A-5, circuit CPW20 (WH/OG); C646-4, circuit CPW19 (VT) and C535A-2, circuit CPW19 (VT); C646-6, circuit CPW31 (GN/WH) and C535A-1, circuit CPW31 (GN/WH) harness side.  N0054130 • **Are the resistances less than 5 ohms?**	**Yes** GO to E6 . **No** REPAIR circuit CPW20 (WH/OG), circuit CPW19 (VT) or circuit CPW31 (GN/WH) for an open. REINITIALIZE the RF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
E6 CHECK THE MASTER WINDOW CONTROL SWITCH	
• Carry out the window control switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the window control switch pass the component test?**	**Yes** INSTALL a new RF power window motor. REFER to Window Regulator Motor — Front Door in this section. REINITIALIZE the RF door window motor. REFER to

	Window Motor Initialization in this section. TEST the system for normal operation. **No** INSTALL a new master window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation.
E7 CHECK CIRCUIT CBP41 (BU) FOR AN OPEN • Disconnect: Passenger Window Control Switch C647. • Key in ON position. • Measure the voltage between passenger window control switch C647-2, circuit CBP41 (BU) harness side and ground.  N0054131 • **Is the voltage greater than 10 volts?**	**Yes** GO to E8 . **No** REPAIR circuit CBP41 (BU) for an open. REINITIALIZE the RF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
E8 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN • Key in OFF position. • Measure the resistance between passenger front window control switch C647-6, circuit GD138 (BK/WH) harness side and ground.  N0054132 • **Is the resistance less than 5 ohms?**	**Yes** GO to E9 . **No** REPAIR circuit GD138 (BK/WH) for an open. REINITIALIZE the RF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
E9 CHECK THE FRONT WINDOW SWITCH TO RF MOTOR FEEDS • Measure the resistance between RF power window motor C646-7, circuit CPW20 (WH/OG) and passenger window control switch C647-3, circuit CPW20 (WH/OG); C646-4, circuit CPW19 (VT) and C647-5, circuit CPW19 (VT); C646-6, circuit CPW31 (GN/WH) and C647-4, circuit CPW31 (GN/WH) harness side.	**Yes** INSTALL a new passenger window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation. **No** REPAIR circuit CPW20 (WH/OG), circuit CPW19

 • **Are the resistances less than 5 ohms?**	(VT) or circuit CPW31 (GN/WH) for an open. REINITIALIZE the RF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.

Pinpoint Test F: A Single Power Window is Inoperative — LR or RR, Expedition

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the LR and RR window control switch receive power from the master window control switch through circuit CPW30 (GY/YE). The LR window control switch provides power to the LR power window motor through circuit CPW21 (BN) and ground through circuit CPW22 (GN/VT) to operate the LR window down and power through circuit CPW22 (GN/VT) and ground through circuit CPW21 (BN) to operate the LR window up. The RR window control switch provides power to the RR power window motor through circuit CPW23 (GY) and ground through circuit CPW24 (WH/VT) to operate the RR window down and power through circuit CPW24 (WH/VT) and ground through circuit CPW23 (GY) to operate the RR window up.

When operating the LR window using the master window control switch, power is sent to the LR window control switch through circuit CPW15 (YE) and ground through circuit CPW16 (BU/OG) to operate the LR window down and power through circuit CPW16 (BU/OG) and ground through circuit CPW15 (YE) to operate the LR window up. When operating the RR window using the master window control switch, power is sent to the RR window control switch through circuit CPW17 (BN/GN) and ground through circuit CPW18 (GY/VT) to operate the RR window down and power through circuit CPW18 (GY/VT) and ground through circuit CPW17 (BN/GN) to operate the RR window up.

Possible Causes

- Window control switch
- Open in circuit CPW30 (GY/YE), CPW21 (BN), CPW22 (GN/VT), CPW23 (GY), CPW24 (WH/VT), CPW15 (YE), CPW16 (BU/OG), CPW17 (BN/GN) or CPW18 (GY/VT)
- Rear door window regulator motor

PINPOINT TEST F: A SINGLE POWER WINDOW IS INOPERATIVE — LR OR RR, EXPEDITION

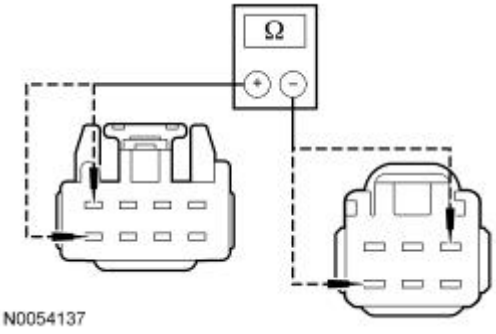
Test Step	Result / Action to Take
F1 CHECK THE VOLTAGE TO THE LR OR RR WINDOW CONTROL SWITCH	
• Disconnect: Inoperative Rear Window Control Switch C701 (LR) or C801 (RR). • Key in ON position. • **NOTE:** Set the window lock switch to the UNLOCK position. • Measure the voltage between the inoperative rear window switch C701-3 or C801-3, circuit CPW30 (GY/YE) harness side and ground.	**Yes** GO to F2 . **No** REPAIR circuit CPW30 (GY/YE) for an open. TEST the

 N0054134 • **Is the voltage greater than 10 volts?**	system for normal operation.
F2 CHECK THE GROUNDS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH	

• Key in OFF position.
• Measure the resistance between the inoperative rear window switch connector and ground.
  ▪ For an inoperative LR window, measure the resistance between LR window switch C701-1, circuit CPW15 (YE), harness side and ground; and between C701-6, circuit CPW16 (BU/OG), harness side and ground.
  ▪ For an inoperative RR window, measure the resistance between RR window switch C801-1, circuit CPW17 (BN/GN), harness side and ground; and between C801-6, circuit CPW18 (GY/VT), harness side and ground.
 N0054135
• **Are the resistances less than 5 ohms?**
	Yes
	GO to F4 .
	
	No
	GO to F3 .

F3 CHECK THE CIRCUITS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH FOR AN OPEN	
• Key in OFF position. • Disconnect: Master Window Control Switch C504B. • For an inoperative LR window, measure the resistance between master window control switch C504B-1, circuit CPW15 (YE) and LR window control switch C701-1, circuit CPW15 (YE); and between master window control switch C504B-6, circuit CPW16 (BU/OG) and LR window control switch C701-6, circuit CPW16 (BU/OG).  N0054136 • For an inoperative RR window, measure the resistance between	**Yes** INSTALL a new master window control switch. REFER to Window Control Switch . TEST the system for normal operation. **No** REPAIR circuit CPW15 (YE), CPW16 (BU/OG), CPW17 (BN/GN) or CPW18 (GY/VT) for an open. TEST the system for normal operation.

master window control switch C504B-4, circuit CPW17 (BN/GN) and RR window control switch C801-1, circuit CPW17 (BN/GN); and between master window control switch C504B-8, circuit CPW18 (GY/VT) and RR window control switch C801-6, circuit CPW18 (GY/VT).

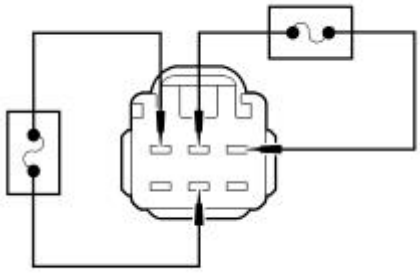


N0054137

- **Are the resistances less than 5 ohms?**

F4 CHECK THE INOPERATIVE WINDOW CONTROL SWITCH

- Connect: Master Window Control Switch C504B.
- Key in ON position.
- Connect fused jumper wires between the inoperative power window switch as shown.
  - For an inoperative LR window, connect a fused jumper wire between LR window control switch C701-5, circuit CPW22 (GN/VT) and C701-3, circuit CPW30 (YE) and connect a second fused jumper wire between C701-2, circuit CPW21 (BN) and C701-1, circuit CPW15 (YE). The window should operate in the up direction.
  - For an inoperative RR window, connect a fused jumper wire between RR window control switch C801-5, circuit CPW24 (WH/VT) and C801-3, circuit CPW30 (YE) and connect a second fused jumper wire between C801-2, circuit CPW23 (GY) and C801-1, circuit CPW17 (BN/GN). The window should operate in the up direction.

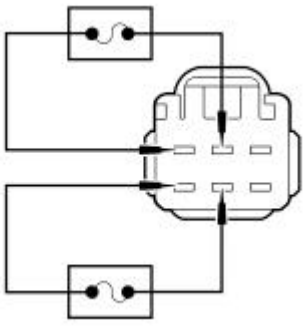


N0054138

- Connect fused jumper wires between the inoperative power window switch as shown.
  - For an inoperative LR window, connect a fused jumper wire between LR window control switch C701-5, circuit CPW22 (GN/VT) and C701-6, circuit CPW16 (BU/OG) and connect a second fused jumper wire between C701-2, circuit CPW21 (BN) and C701-3, circuit CPW30 (GY/YE). The window should operate in the down direction.
  - For an inoperative RR window, connect a fused jumper wire between RR window control switch C801-5, circuit CPW24 (WH/VT) and C801-6, circuit CPW18 (GY/VT) and connect a second fused jumper wire between C801-2, circuit CPW23 (GY) and C801-3, circuit CPW30 (GY/YE). The window should operate in the down direction.

Yes
INSTALL a new rear window control switch. REFER to Window Control Switch . TEST the system for normal operation.

No
GO to F5 .

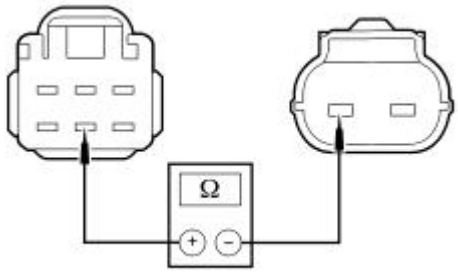


N0054139

- **Does the window operate correctly?**

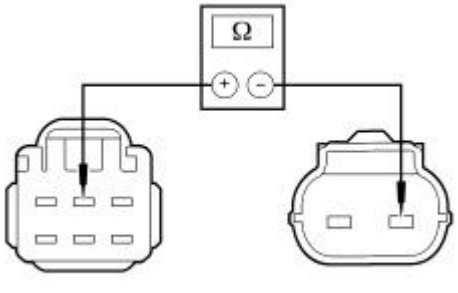
F5 CHECK POWER WINDOW MOTOR CIRCUITS

- Key in OFF position.
- Disconnect: Inoperative Power Window Motor C703 (LR) or C803 (RR).
- Measure the resistance between inoperative window control switch and the inoperative window motor.
  - For an inoperative LR window, measure the resistance between LR window control switch C701-5, circuit CPW22 (GN/VT), harness side and LR power window motor C703-2, circuit CPW22 (GN/VT) harness side.
  - For an inoperative RR window, measure the resistance between RR window control switch C801-5, circuit CPW24 (WH/VT), harness side and RR power window motor C803-2, circuit CPW24 (WH/VT) harness side.



N0054140

- Measure the resistance between inoperative window control switch and the inoperative window motor.
  - For an inoperative LR window, measure the resistance between LR window control switch C701-2, circuit CPW21 (BN), harness side and LR power window motor C703-1, circuit CPW21 (BN) harness side.
  - For an inoperative RR window, measure the resistance between RR window control switch C801-2, circuit CPW23 (GY), harness side and RR power window motor C803-1, circuit CPW23 (GY) harness side.



N0054141

Yes
INSTALL a new rear window regulator motor. REFER to Window Regulator Motor — Rear Door . TEST the system for normal operation.

No
REPAIR the circuit (s) for an open. TEST the system for normal operation.

• **Are the resistances less than 5 ohms?**	

Pinpoint Test G: A Single Power Window is Inoperative — LR or RR, Navigator

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the master window control switch receives power for the LR and RR window circuits through circuit CBP47 (GN/BU). The LR and RR window control switch receive power from the master window control switch through circuit CPW30 (GY/YE). The LR window control switch provides power to the LR power window motor through circuit CPW21 (BN) and ground through circuit CPW22 (CN/VT) to operate the LR window down, and power through circuit CPW22 (CN/VT) and ground through circuit CPW21 (BN) to operate the LR window up. The RR window control switch provides power to the RR power window motor through circuit CPW23 (GY) and ground through circuit CPW24 (WH/VT) to operate the RR window down, and power through circuit CPW24 (WH/VT) and ground through circuit CPW23 (GY) to operate the RR window up.

When operating the LR window using the master window control switch, power is sent to the LR window control switch through circuit CPW15 (YE) and ground through circuit CPW16 (BU/OG) to operate the LR window down, and power through circuit CPW16 (BU/OG) and ground through circuit CPW15 (YE) to operate the LR window up. When operating the RR window using the master window control switch, power is sent to the RR window control switch through circuit CPW17 (BN/GN) and ground through circuit CPW18 (GY/VT) to operate the RR window down, and power through circuit CPW18 (GY/VT) and ground through circuit CPW17 (BN/GN) to operate the RR window up.

Possible Causes

- Fuse
- Window control switch
- Open in circuit CBP47 (GN/BU), CPW30 (GY/YE), CPW15 (YE), CPW16 (BU/OG), CPW17 (BN/GN), CPW18 (GY/VT), CPW21 (BN), CPW22 (CN/VT), CPW23 (GY) or CPW24 (WH/VT)
- Rear door window regulator motor

PINPOINT TEST G: A SINGLE POWER WINDOW IS INOPERATIVE — LR OR RR, NAVIGATOR

Test Step	Result / Action to Take
G1 CHECK CIRCUIT CBP47 (GN/BU) FOR VOLTAGE	
• Disconnect: Master Window Control Switch C504B. • Key in ON position. • Measure the voltage between master window control switch C504B-3, circuit CBP47 (GN/BU) and ground.  N0054142 • **Is the voltage greater than 10 volts?**	**Yes** GO to G2 . **No** VERIFY the smart junction box (SJB) circuit breaker 47 (30A) is OK. If OK, REPAIR circuit CBP47 (GN/BU) for an open. TEST the system for normal operation.

G2 CHECK THE VOLTAGE TO THE LR OR RR WINDOW CONTROL SWITCH	

• Connect: Master Window Control Switch C504B.
• Disconnect: Inoperative Rear Window Control Switch C717 (LR) or C819 (RR).
• Key in ON position.
• **NOTE:** Set the window lock switch to the UNLOCK position.
• Measure the voltage between the inoperative rear window control switch connector and ground.
  ▪ For an inoperative LR window, measure the voltage between LR window control switch C717-3, circuit CPW30 (GY/YE), harness side and ground.
  ▪ For an inoperative RR window, measure the voltage between RR window control switch C819-3, circuit CPW30 (GY/YE), harness side and ground.
 N0054134
• **Is the voltage greater than 10 volts?**
	Yes
	GO to G3 .
	
	No
	REPAIR circuit CPW30 (GY/YE) for an open. TEST the system for normal operation.

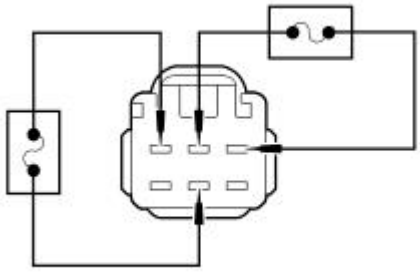
G3 CHECK THE GROUNDS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH	

• Key in OFF position.
• Measure the resistance between the inoperative window control switch and ground.
  ▪ For an inoperative LR window, measure the resistance between LR window control switch C717-1, circuit CPW15 (YE), harness side and ground; and between C717-6, circuit CPW16 (BU/OG), harness side and ground.
  ▪ For an inoperative RR window, measure the resistance between RR window control switch C819-1, circuit CPW15 (YE), harness side and ground; and between C819-6, circuit CPW16 (BU/OG), harness side and ground.
 N0054135
• **Are the resistances less than 5 ohms?**
	Yes
	GO to G5 .
	
	No
	GO to G4 .

G4 CHECK THE CIRCUITS TO THE INOPERATIVE REAR WINDOW CONTROL SWITCH FOR AN OPEN	
• Key in OFF position. • Disconnect: Master Window Control Switch C535B. • For an inoperative LR window, measure the resistance between	**Yes** INSTALL a new master window

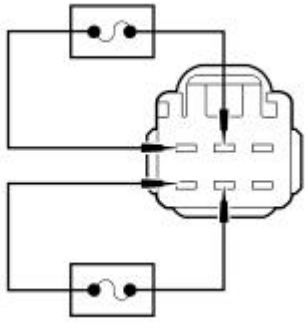
master window control switch C535B-1, circuit CPW15 (YE), harness side and LR window control switch C717-1, circuit CPW15 (YE) harness side; and between master window control switch C535B-2, circuit CPW16 (BU/OG), harness side and LR window control switch C717-6, circuit CPW16 (BU/OG) harness side.  N0054143 • For an inoperative RR window, measure the resistance between master window control switch C535B-7, circuit CPW17 (BN/GN), harness side and RR window control switch C819-1, circuit CPW17 (BN/GN) harness side; and between master window control switch C535B-8, circuit CPW18 (GY/VT), harness side and RR window control switch C819-6, circuit CPW18 (GY/VT) harness side.  N0054144 • **Are the resistances less than 5 ohms?**	control switch. REFER to Window Control Switch . TEST the system for normal operation. **No** REPAIR the circuit (s) for an open. TEST the system for normal operation.
G5 CHECK THE INOPERATIVE WINDOW CONTROL SWITCH	

• Connect: Master Window Control Switch C535B.
• Key in ON position.
• Connect fused jumper wires between the inoperative power window switch as shown.
  ▪ For an inoperative LR window, connect a fused jumper wire between LR window control switch C717-1, circuit CPW15 (YE) and C717-2, circuit CPW21 (BN) and connect a second fused jumper wire between C717-5, circuit CPW22 (GN/VT) and C717-3, circuit CPW30 (YE). The window should operate in the up direction.
  ▪ For an inoperative RR window, connect a fused jumper wire between RR window control switch C819-1, circuit CPW17 (BN/GN) and C819-2, circuit CPW23 (GY) and connect a second fused jumper wire between C819-5, circuit CPW24 (WH/VT) and C819-3, circuit CPW30 (YE). The window should operate in the up direction.
	Yes
	INSTALL a new rear window regulator control switch.
	REFER to Window Control Switch .
	TEST the system for normal operation.
	
	No
	GO to G6 .



N0054138

- Connect fused jumper wires between the inoperative power window switch as shown.
  - For an inoperative LR window, connect a fused jumper wire between LR window control switch C717-3, circuit CPW30 (YE) and C717-2, circuit CPW21 (BN) and connect a second fused jumper wire between C717-5, circuit CPW22 (GN/VT) and C717-6, circuit CPW16 (BU/OG). The window should operate in the down direction.
  - For an inoperative RR window, connect a fused jumper wire between RR window control switch C819-3, circuit CPW30 (YE) and C819-2, circuit CPW23 (GY) and connect a second fused jumper wire between C819-5, circuit CPW24 (WH/VT) and C819-6, circuit CPW18 (GY/VT). The window should operate in the down direction.

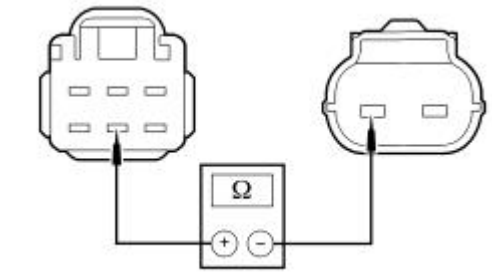


N0054139

- **Does the window operate correctly?**

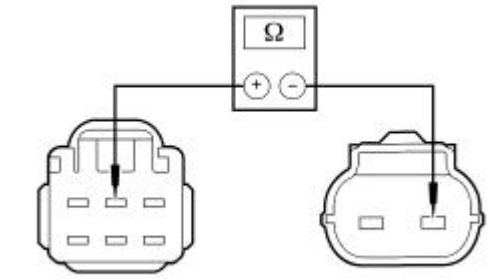
G6 CHECK THE POWER WINDOW MOTOR CIRCUITS	

• Key in OFF position.
• Disconnect: Inoperative Power Window Motor C703 (LR) or C803 (RR).
• Measure the resistance between inoperative window control switch and the inoperative window motor.
  ▪ For an inoperative LR window, measure the resistance between LR window control switch C717-5, circuit CPW22 (GN/VT), harness side and LR power window motor C703-2, circuit CPW22 (GN/VT) harness side.
  ▪ For an inoperative RR window, measure the resistance between RR window control switch C819-5, circuit CPW24 (WH/VT), harness side and RR power window motor C803-2, circuit CPW24 (WH/VT) harness side.
	Yes
	INSTALL a new window motor. REFER to Window Regulator Motor — Front Door . TEST the system for normal operation.
	
	No
	REPAIR circuit CPW21 (BN), CPW22 (GN/VT), CPW23 (GY) or CPW24 (WH/VT) for an open. TEST the system for normal operation.



N0054140

- Measure the resistance between inoperative window control switch and the inoperative window motor.
  - For an inoperative LR window, measure the resistance between LR window control switch C717-2, circuit CPW21 (BN), harness side and LR power window motor C703-1, circuit CPW21 (BN) harness side.
  - For an inoperative RR window, measure the resistance between RR window control switch C819-2, circuit CPW23 (GY), harness side and RR power window motor C803-1, circuit CPW23 (GY) harness side.



N0054141

- **Are the resistances less than 5 ohms?**

Pinpoint Test H: The One-Touch Up/Down Feature is Inoperative — LF, Navigator

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the LF power window motor microprocessor receives power at all times through circuit SBP01 (RD) and from the accessory delay relay through circuit CBP41 (BU). Ground is provided at all times through circuit GD143 (BK/VT). The master window control switch provides voltage input to the power window motor microprocessor through circuit CPW10 (YE/VT) to operate the driver window down, and voltage input through circuit CPW11 (BU/GY) to operate the driver window up. To operate the one-touch feature, the master window control switch provides a ground input to the LF power window motor microprocessor through circuit CPW29 (VT/GY) in addition to the up or down request.

Possible Causes

- Fuse(s)
- Open in circuit CPW11 (BU/GY), CPW10 (YE/VT), CPW29 (VT/GY), GD143 (BK/VT), SBP01 (RD) or CPB41 (BU)
- Window control switch

PINPOINT TEST H: THE ONE-TOUCH UP/DOWN FEATURE IS INOPERATIVE — LF, NAVIGATOR

NOTE: The LF power window motor is not on the multiplex link.

NOTE: A new LF power window motor will be in proportional up/down mode until initialized. Refer to Window Motor Initialization in this section.

NOTE: The LF power window motor must be reinitialized whenever: the motor is removed from the window regulator drum housing, a new motor is installed, a new window regulator is installed, a new window glass is installed, a new top run is installed and when carrying out any operation in which grease or lubricants are applied to the window system.

Test Step	Result / Action to Take
H1 CHECK FOR POWER (B+) LOSS DURING LF WINDOW OPERATION	
• Verify if power (B+) was lost during LF window operation. • **Was power (B+) lost while LF window was in operation?**	**Yes** LOWER the LF window to the full open position. MAKE SURE the window glass stalls in the full down position for at least a half second. Normal functionality should resume. TEST the system for normal operation. **No** GO to H2.
H2 INITIALIZE THE LF MOTOR	
• Carry out the LF window motor initialization procedure. Refer to Window Motor Initialization in this section. • **Are the one-touch up/down functions operating correctly?**	**Yes** Repair is complete. TEST the system for normal operation. **No** GO to H3.
H3 CHECK THE MASTER WINDOW CONTROL SWITCH	
• Carry out the front window switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the front window switch pass the component test?**	**Yes** GO to H4. **No** INSTALL a new master window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation.
H4 CHECK THE FRONT WINDOW SWITCH TO LF MOTOR FEEDS	
• Key in OFF position. • Open the front door to disable delayed accessory power. • Disconnect: Master Power Window Control Switch C535A. • Disconnect: LF Power Window Motor C540. • Measure the resistance between LF power window motor C540-7, circuit CPW11 (BU/GY) and master window control switch C535A-4, circuit CPW11 (BU/GY); C540-4, circuit CPW10 (YE/VT) and C535A-7, circuit CPW10 (YE/VT); C540-6, circuit CPW29 (VT/GY) and C535A-8, circuit CPW29 (VT/GY) harness side.	**Yes** GO to H5. **No** REPAIR circuit CPW11 (BU/GY), circuit CPW10 (YE/VT), circuit CPW29 (VT/GY) for an open. REINITIALIZE the LF power window motor. REFER to Window Motor Initialization in this section. TEST the

 N0054121 • **Are the resistances less than 5 ohms?**	system for normal operation.
H5 CHECK FOR AN INTERMITTENT GROUND CONNECTION	
• Key in OFF position. • Measure the resistance between LF power window motor C540-8, circuit GD143 (BK/VT) harness side and ground.  N0057830 • Wiggle the harness while measuring the resistances. • **Is the resistance less than 5 ohms?**	**Yes** GO to H6 . **No** REPAIR circuit GD143 (BK/VT) for an open. REINITIALIZE the LF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
H6 CHECK FOR INTERMITTENT POWER CONNECTIONS	
• Key in ON position. • Measure the voltage between LF power window motor C540-3, circuit SBP01 (RD) and C540-2, circuit CPB41 (BU) harness side and ground.  N0054145 • Wiggle the harness while measuring the voltages. • **Are the voltages greater than 10 volts?**	**Yes** INSTALL a new LF power window motor. REFER to Window Regulator Motor — Front Door in this section. REINITIALIZE the LF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation. **No** VERIFY SJB fuse 1 (30A) and fuse 41 (15A) are OK. If OK, REPAIR circuit SBP01 (RD) or circuit CPB41 (BU) for an open. REINITIALIZE the LF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.

Pinpoint Test I: The One-Touch Up/Down Feature is Inoperative — RF, Navigator

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the RF power window motor microprocessor receives power at all times through circuit SBP04 (GN/RD) and from the accessory delay relay through circuit CBP41 (BU). Ground is provided at all times through circuit GD138 (BK/WH). The master window control switch or RF window control switch provides voltage input to the power window motor microprocessor through circuit CPW19 (VT) to operate the RF window down, and voltage input through circuit CPW20 (WH/OG) to operate the RF window up. To operate the one-touch feature, the master window control switch or RF window control switch provides a ground input to the RF power window motor microprocessor through circuit CPW31 (GN/WH) in addition to the up or down request.

Possible Causes

- Fuse(s)
- Open in circuit CPW20 (WH/OG), CPW19 (VT), CPW31 (GN/WH), GD138 (BK/WH), SBP04 (GN/RD) or CBP41 (BU)
- Window control switch

PINPOINT TEST I: THE ONE-TOUCH UP/DOWN FEATURE IS INOPERATIVE — RF, NAVIGATOR

NOTE: The RF power window motor is not on the multiplex link.

NOTE: A new RF power window motor will be in proportional up/down mode until initialized. Refer to Window Motor Initialization in this section.

NOTE: The RF power window motor must be reinitialized whenever: the motor is removed from the window regulator drum housing, a new motor is installed, a new window regulator is installed, a new window glass is installed, a new top run is installed and when carrying out any operation in which grease or lubricants are applied to the window system.

Test Step	Result / Action to Take
I1 CHECK THE MASTER WINDOW CONTROL SWITCH OPERATION	
• Attempt to operate the RH window in one-touch up/down mode using the master window control switch. • **Does the RH window operate in one-touch up/down mode when using the master window control switch?**	**Yes** GO to I8 . **No** GO to I2 .
I2 CHECK FOR POWER (B+) LOSS DURING RF WINDOW OPERATION	
• Verify if power (B+) was lost during RF window operation. • **Was power (B+) lost while RF window was in operation?**	**Yes** LOWER the RF window to the full open position. MAKE SURE the window glass stalls in the full down position for at least a half second. Normal functionality should resume. TEST the system for normal operation. **No** GO to I3 .
I3 INITIALIZE THE RF MOTOR	
• Carry out the RF window motor initialization procedure. Refer to Window Motor Initialization in this section. • **Are the one-touch up/down functions operating**	**Yes** Repair is complete. TEST the system for normal

correctly?	operation. **No** GO to I4 .
I4 CHECK THE MASTER WINDOW CONTROL SWITCH	
• Carry out the front window switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the front window switch pass the component test?**	**Yes** GO to I5 . **No** INSTALL a new master window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation.
I5 CHECK THE FRONT WINDOW SWITCH TO RF MOTOR FEEDS	
• Key in OFF position. • Open the front door to disable delayed accessory power. • Disconnect: Power Window Switch C535A. • Disconnect: RF Power Window Motor C646. • Measure the resistance between RF power window motor C646-7, circuit CPW20 (WH/OG) and master window control switch C535A-5, circuit CPW20 (WH/OG); C646-4, circuit CPW19 (VT) and C535A-2, circuit CPW19 (VT); C646-6, circuit CPW31 (GN/WH) and C535A-1, circuit CPW31 (GN/WH) harness side.  N0054130 • **Are the resistances less than 5 ohms?**	**Yes** GO to I6 . **No** REPAIR circuit CPW20 (WH/OG), circuit CPW19 (VT) or circuit CPW31 (GN/WH) for an open. REINITIALIZE the RF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
I6 CHECK FOR AN INTERMITTENT GROUND CONNECTION	
• Key in OFF position. • Measure the resistance between RF power window motor C646-8, circuit GD138 (BK/WH) harness side and ground.  N0057830 • Wiggle the harness while measuring the resistances. • **Is the resistance less than 5 ohms?**	**Yes** GO to I7 . **No** REPAIR circuit GD138 (BK/WH) for an open. REINITIALIZE the RF power window motor. REFER to Window Motor Initialization Initialization in this section. TEST the system for normal operation.
I7 CHECK FOR INTERMITTENT POWER CONNECTIONS	
• Key in ON position.	**Yes**

• Measure the voltage between RF power window motor C646-3, circuit SBP04 (GN/RD) and C646-2, circuit CBP41 (BU) harness side and ground.  N0054145 • Wiggle the harness while measuring the voltages. • **Are the voltages greater than 10 volts?**	INSTALL a new RF power window motor. REFER to Window Regulator Motor — Front Door in this section. REINITIALIZE the RF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation. **No** VERIFY SJB fuse 4 (30A) and fuse 41 (15A) are OK. If OK, REPAIR circuit SBP04 (GN/RD) or circuit CBP41 (BU) for an open. REINITIALIZE the RF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.
I8 CHECK THE FRONT WINDOW SWITCH TO RF MOTOR FEEDS	
• Measure the resistance between RF power window motor C646-7, circuit CPW20 (WH/OG) and passenger window control switch C647-3, circuit CPW20 (WH/OG); C646-4, circuit CPW19 (VT) and C647-5, circuit CPW19 (VT); C646-6, circuit CPW31 (GN/WH) and C647-4, circuit CPW31 (GN/WH) harness side.  N0054133 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new passenger window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation. **No** REPAIR circuit CPW20 (WH/OG), circuit CPW19 (VT) or circuit CPW31 (GN/WH) for an open. REINITIALIZE the RF power window motor. REFER to Window Motor Initialization in this section. TEST the system for normal operation.

Pinpoint Test J: The Left or Right Power Window is Inoperative — Rear Vent Window

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

Under normal operation, the quarter window control switch, quarter window close relay and quarter window open relay receive power from the accessory delay relay through circuit CBP41 (BU). Ground is provided to the quarter window close relay and quarter window open relay through circuit GD151 (BK/GN). The quarter window control switch activates the quarter window open relay by supplying a ground input through circuit CPW26 (BU/BN) and activates the quarter window close relay by supplying a ground input through circuit CPW25 (YE/BU). When the quarter window open relay is activated, power is supplied to the LH and RH quarter window motors through circuit CPW27 (GN) and ground through circuit CPW28 (WH/BN) through the quarter window close relay circuit GD151 (BK/GN) to operate the quarter windows open. When the quarter window close relay is activated, power is supplied to the LH and RH quarter window motors through circuit CPW28 (WH/BN) and ground through circuit CPW27

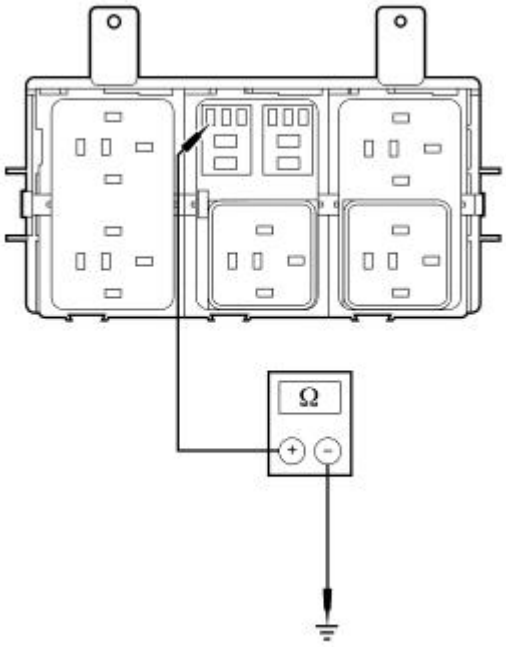
(GN) through the quarter window open relay circuit GD151 (BK/GN) to operate the quarter windows closed.

Possible Causes

- Fuse
- Quarter window close relay
- Quarter window open relay
- Open in circuit CBP41 (BU), GD151 (BK/GN), CPW25 (YE/BU) or CPW26 (BU/BN), CPW27 (GN) or CPW28 (WH/BN)
- Quarter window control switch
- Rear quarter window regulator motor

PINPOINT TEST J: THE LEFT OR RIGHT POWER WINDOW IS INOPERATIVE — REAR VENT WINDOW

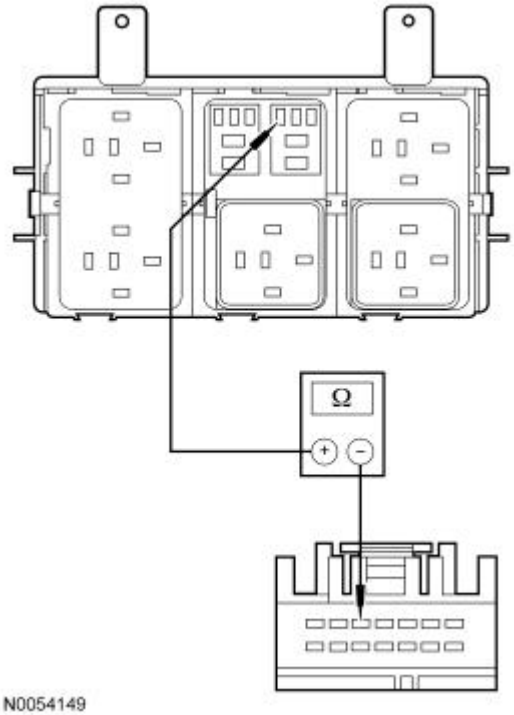
Test Step	Result / Action to Take
J1 CHECK THE VENT WINDOW OPERATION	
• Attempt to operate the vent windows while observing both LR and RR vent window operation. • **Are both the LH and RH vent windows inoperative?**	**Yes** GO to J2 . **No** GO to J8 .
J2 CHECK FOR GROUND INPUT TO THE VENT WINDOW OPEN AND CLOSE RELAYS	
• Disconnect: Quarter Window Open Relay and Quarter Window Close Relay. • While holding the quarter window control switch in the CLOSE position, measure the resistance between quarter window close relay pin 2, circuit CPW25 (YE/BU), harness side and ground.  N0054146 • While holding the quarter window control switch in the OPEN position, measure the resistance between quarter window open relay pin 2, circuit CPW26 (BU/BN), harness side and ground.	**Yes** GO to J5 . **No** GO to J3 .



N0054147

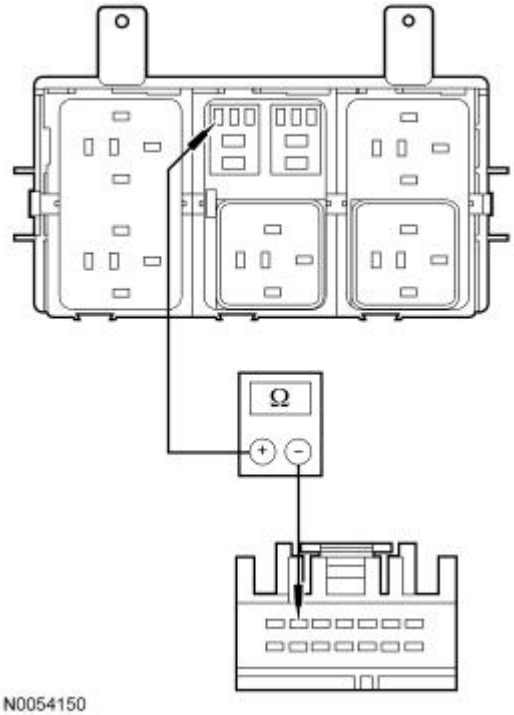
- **Are the resistances less than 5 ohms?**

J3 CHECK FOR GROUND AT THE VENT WINDOW SWITCH	
• Disconnect: Overhead Console Switch C930. • Measure the resistance between quarter window control switch C930-1, circuit GD150 (BK/WH), harness side and ground; and between quarter window control switch C930-7, circuit GD150 (BK/WH), harness side and ground.  N0054148 • **Are the resistances less than 5 ohms?**	**Yes** GO to J4 . **No** REPAIR circuit GD150 (BK/WH) for an open. TEST the system for normal operation.
J4 CHECK CIRCUIT CPW25 (YE/BU) AND CIRCUIT CPW26 (BU/BN) FOR AN OPEN	
• Measure the resistance between power vent window close relay pin 2, circuit CPW25 (YE/BU), harness side and power vent window switch C930-5, circuit CPW25 (YE/BU), harness side.	**Yes** INSTALL a new vent power window switch. REFER to Window Control Switch . TEST the system for normal operation. **No** REPAIR the open circuit CPW25 (YE/BU) or CPW26 (BU/BN) for an open. TEST the system for normal operation.



N0054149

- Measure the resistance between power vent window open relay pin 2, circuit CPW26 (BU/BN), harness side and power vent window switch C930-6, circuit CPW26 (BU/BN), harness side.

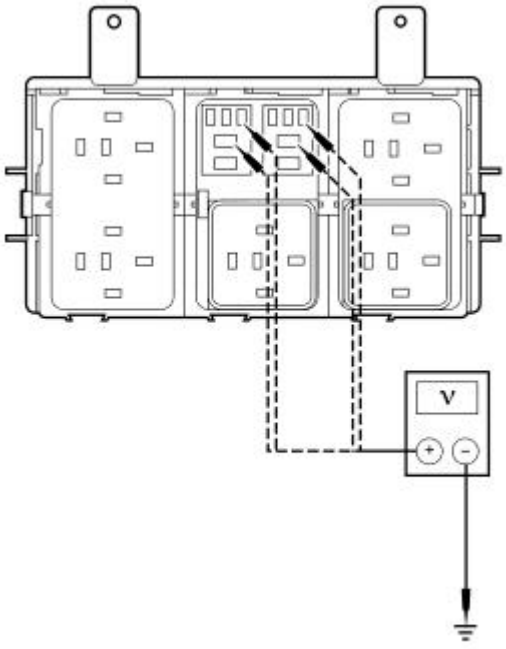


N0054150

- **Are the resistances less than 5 ohms?**

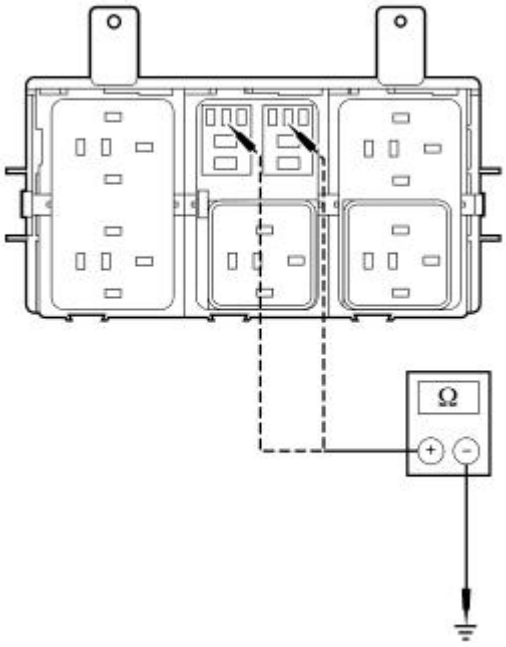
J5 CHECK THE POWER VENT WINDOW OPEN AND CLOSE RELAY	
• Carry out the relay component test on the power vent window open and close relays. • Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the power vent window open and close relay pass the**	**Yes** GO to J6 . **No** INSTALL a new relay. TEST the system for

component test?	normal operation.
J6 CHECK FOR POWER TO THE VENT WINDOW OPEN AND CLOSE RELAYS	

• Key in ON position.
• Measure the voltage between quarter window open relay and close relay, harness side and ground.
  ▪ Pin 1, circuit CBP41 (BU)
  ▪ Pin 5, circuit CBP41 (BU)
  	


N0054151
• **Is the voltage greater than 10 volts?**
	Yes
	GO to J7 .
	
	No
	VERIFY SJB fuse 41 (15A) is OK. If OK, REPAIR circuit CBP41 (BU) for an open. TEST the system for normal operation.

J7 CHECK CIRCUIT GD151 (BK/GN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between quarter window open relay and close relay, harness side and ground. ▪ Pin 4, circuit GD151 (BK/GN)	**Yes** GO to J8 . **No** REPAIR circuit GD151 (BK/GN) for an open. TEST the system for normal operation.

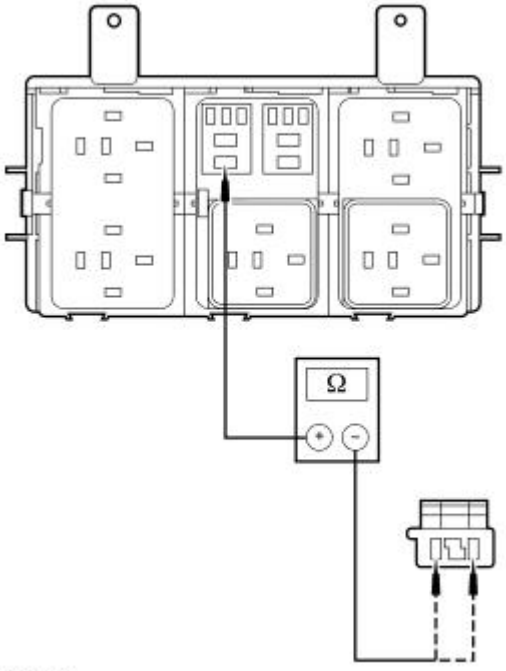


N0054152

- **Are the resistances less than 5 ohms?**

J8 CHECK THE MOTOR CIRCUITS

- Key in OFF position.
- Disconnect: Power Vent Window Motor C4047 (LH) or C4090 (RH).
- Measure the resistance between power vent window open relay pin 3, circuit CPW27 (GN), harness side and inoperative power vent window motor:
  - (RH) C4090-1, circuit CPW27 (GN).
  - (LH) C4047-2, circuit CPW27 (GN).



N0054153

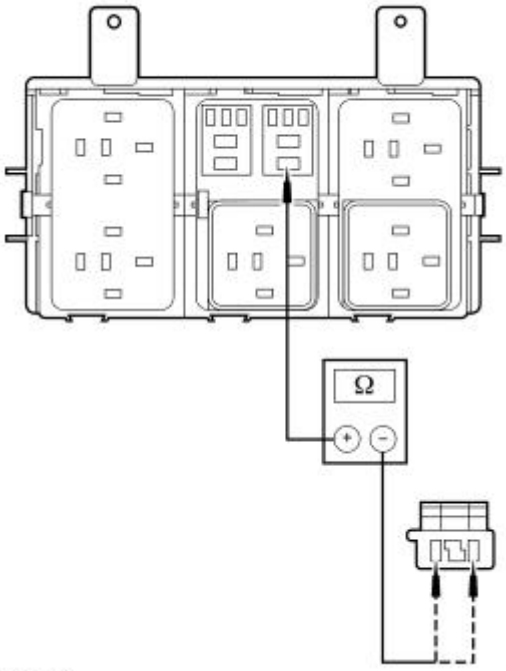
- Measure the resistance between power vent window close relay

Yes
INSTALL a new power vent window regulator motor. REFER to Window Regulator Motor — Rear Quarter . TEST the system for normal operation.

No
REPAIR circuit(s). TEST the system for normal operation.

pin 3, circuit CPW28 (WH/BN), harness side and power vent window motor:

- (RH) C4090-2, circuit CPW28 (WH/BN).
- (LH) C4047-1, circuit CPW28 (WH/BN).



- **Are the resistances less than 5 ohms?**

Pinpoint Test K: The Defrost System is Inoperative

Refer to Wiring Diagrams Cell 56 , Heated Window for schematic and connector information.

Normal Operation

During normal operation, the electronic automatic temperature control (EATC) module or electronic manual temperature control (EMTC) activates the rear window defrost relay by grounding the relay coil through circuit CH122 (WH/OG). When the defrost relay is activated, power is supplied from the relay to the rear window defrost grid through circuit CRD06 (BN/YE) and also to the LH/RH exterior rear view mirror heaters through circuit CBB23 (BN/YE). Ground is supplied to the rear window defrost grid and exterior mirror heaters through circuit GD150 (BK/WH).

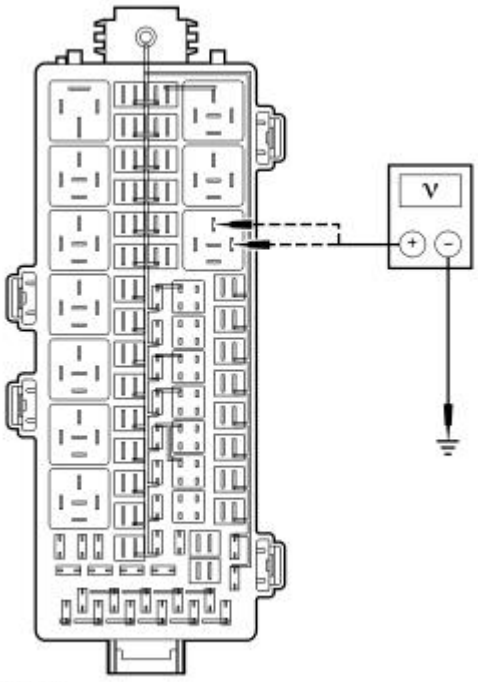
Possible Causes

- Fuse(s)
- Rear window defrost relay
- Open in circuit CH122 (WH/OG), CRD06 (BN/YE) or GD150 (BK/WH)
- EATC module
- EMTC module
- Open or short in rear window defrost grid

PINPOINT TEST K: THE DEFROST SYSTEM IS INOPERATIVE

Test Step	Result / Action to Take

K1 CHECK THE REAR WINDOW DEFROST GRID VOLTAGE	
• Disconnect: Rear Window Defrost Grid Power C402A. • Key in ON position. • Activate the rear defrost switch and measure the voltage between rear window defrost grid power C402A, circuit CRD06 (BN/YE) and ground.  A0010207 • **Is the voltage greater than 10 volts?**	**Yes** GO to K2 . **No** GO to K3 .
K2 CHECK THE REAR WINDOW DEFROST GRID GROUND	
• Key in OFF position. • Disconnect: Rear Window Defrost Grid Ground C402B. • Measure the resistance between rear window defrost grid ground C402B, circuit GD150 (BK/WH) and ground.  A0010216 • **Is the resistance less than 5 ohms?**	**Yes** Carry out the Grid Wire Test in this section. REPAIR the rear window defrost grid or INSTALL a new liftgate glass. REFER to Window Grid Wire Repair . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
K3 CHECK THE POWER TO THE RELAY	
• Key in OFF position. • Disconnect: Rear Window Defrost Relay. • Key in ON position. • Measure the voltage between rear window defrost relay socket pin 86 and pin 30 harness side and ground.	**Yes** GO to K4 . **No** VERIFY the battery junction box (BJB) fuse 28 (40A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.



N0054155

- **Is the voltage greater than 10 volts?**

K4 CHECK THE EATC/EMTC OUTPUT	
• Activate the rear defrost switch and measure the voltage between rear window defrost relay socket pin 85 and pin 86, circuit CH122 (WH/OG), harness side.  N0054156 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new rear window defrost relay. TEST the system for normal operation. **No** GO to K5 .
K5 CHECK CIRCUIT CH122 (WH/OG) FOR AN OPEN	
• Key in OFF position. • Disconnect: Electronic Automatic Temperature Control (EATC) C228B or Electronic Manual Temperature Control (EMTC) C294B.	**Yes** GO to K6 . **No**

• Measure the resistance between rear window defrost relay socket pin 85, circuit CH122 (WH/OG), harness side and C228B-23 (EATC) or C294B-23, circuit CH122 (WH/OG), harness side.  N0054157 • **Is the resistance less than 5 ohms?**	REPAIR the circuit. TEST the system for normal operation.
K6 CHECK FOR CORRECT EATC/EMTC OPERATION	

• Disconnect all EATC/EMTC connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all EATC/EMTC connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new EATC/EMTC. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test L: The Defrost System Will Not Shut Off Automatically

Refer to Wiring Diagrams Cell 56 , Heated Window for schematic and connector information.

Normal Operation

During normal operation, the EATC or EMTC activates the rear window defrost relay by providing grounding the relay coil through circuit CH122 (WH/OG). When the defrost relay is activated, power is supplied from the rear window defrost relay through circuit CRD06 (BN/YE) to the rear window defrost grid. Ground is supplied to the rear window defrost grid through circuit GD150 (BK/WH).

Possible Causes

- Short to voltage in circuit CRD06 (BN/YE)
- Short to ground in circuit CH122 (WH/OG)
- Rear window defrost relay

- EATC or EMTC

PINPOINT TEST L: THE DEFROST SYSTEM WILL NOT SHUT OFF AUTOMATICALLY

Test Step	Result / Action to Take
L1 CHECK CIRCUIT CRD06 (BN/YE) FOR A SHORT TO VOLTAGE	
• Disconnect: Rear Window Defrost Relay. • Key in ON position. • **Is the rear window defrost ON?**	**Yes** REPAIR circuit CRD06 (BN/YE) for a short to voltage. TEST the system for normal operation. **No** GO to L2 .
L2 CHECK THE REAR WINDOW DEFROST RELAY	
• Key in ON position. • Measure the voltage between rear window defrost relay socket pin 85 and pin 86, circuit CH122 (WH/OG), harness side.  N0054156 • **Is the voltage greater than 10 volts?**	**Yes** GO to L3 . **No** INSTALL a new rear window defrost relay. TEST the system for normal operation.
L3 CHECK THE EATC or EMTC MODULE	
• Disconnect: Electronic Automatic Temperature Control (EATC) C228B or Electronic Manual Temperature Control (EMTC) C294B. • Measure the voltage between rear window defrost relay socket pin 85 and pin 86, circuit CH122 (WH/OG), harness side.	**Yes** REPAIR short to ground in circuit CH122 (WH/OG). TEST the system for normal operation. **No** GO to L4 .

 N0054156 • **Is the voltage greater than 10 volts?**	
L4 CHECK FOR CORRECT EATC/EMTC OPERATION	

• Disconnect all EATC/EMTC connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all EATC/EMTC connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new EATC/EMTC. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test M: The Delayed Accessory is Inoperative

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

The delayed accessory relay, which is integral to the smart junction box (SJB), receives power at all times through circuit SDC04 (RD). When the ignition key is turned ON, the SJB activates the delayed accessory relay, which provides power to the LH front window switch (Expedition) through circuit CBP47 (GN/BU). For Navigator, delayed accessory power is provided to the LF and RF power window motors, RH front window switch and front window circuits in the LH front window switch through circuit CBP41 (BU). The rear window circuits are powered by circuit CBP47 (GN/BU).The delayed accessory feature remains active for 10 minutes after the ignition key is turned OFF or until either front door is opened.

Possible Causes

- Fuse
- Circuit breaker
- Delayed accessory relay
- Open in circuit SDC04 (RD), CBP47 (GN/BU) or CBP41 (BU) (Navagitor only)
- Smart junction box (SJB)

PINPOINT TEST M: THE DELAYED ACCESSORY IS INOPERATIVE

Test Step	Result / Action to Take
M1 CHECK THE DELAYED ACCESSORY RELAY	
• Open and close the front doors. Verify the interior lights turn on when the doors are open, and off when the doors are closed. • **Do the interior lights operate normally?**	**Yes** GO to M2 . **No** REFER to Section 417-02 to diagnose the interior lighting and door ajar switches.
M2 CHECK THE DELAYED ACCESSORY RELAY	
• Disconnect: Delayed Accessory Relay. • Carry out the delayed accessory relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the delayed accessory relay pass the component test?**	**Yes** GO to M3 . **No** INSTALL a new delayed accessory relay. TEST the system for normal operation.
M3 CHECK THE POWER TO THE RELAY	
• Key in ON position. • Measure the voltage between delayed accessory relay socket pin 86, circuit SDC04 (RD), harness side and ground; and between delayed accessory relay socket pin 30, circuit SDC04 (RD), harness side and ground.  N0054158 • **Is the voltage greater than 10 volts for both measurements?**	**Yes** GO to M5 . **No** GO to M4 .
M4 CHECK CIRCUIT SDC04 (RD) FOR AN OPEN	
• Key in OFF position. • Open the front door to disable delayed accessory power.	**Yes** GO to M5 .

• Disconnect: Smart Junction Box (SJB) C2280C. • Measure the voltage between SJB C2280C-1, circuit SDC04 (RD), harness side and ground.  N0054159 • **Is the voltage greater than 10 volts?**	**No** REPAIR circuit SDC04 (RD) for an open. TEST the system for normal operation.
M5 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all SJB connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test N: The Delayed Accessory Does Not Turn Off

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

The delayed accessory relay, which is integral to the smart junction box (SJB), receives power at all times through circuit SDC04 (RD). When the ignition key is turned ON, the SJB activates the delayed accessory relay, which provides power to the LH front window switch (Expedition) through circuit CBP47 (GN/BU). For Navigator, delayed accessory power is provided to the LF and RF power window motors, RH front window switch and front window circuits in the LH front window switch through circuit CBP41 (BU). The rear window circuits are powered by circuit CBP47 (GN/BU). The delayed accessory feature remains active for 10 minutes after the ignition key is turned OFF or until either front door is opened.

Possible Causes

- Delayed accessory relay
- Short to voltage in circuit CBP47 (GN/BU) or CBP41 (BU) (Navigator only)
- Smart junction box (SJB)

PINPOINT TEST N: THE DELAYED ACCESSORY DOES NOT TURN OFF

Test Step	Result / Action to Take
N1 CHECK FOR STUCK/STICKING ACCESSORY DELAY RELAY	

• Disconnect: Delayed Accessory Relay. • **Are any delayed accessory features still operative?**	**Yes** GO to N3 . **No** GO to N2 .
N2 CHECK THE DELAYED ACCESSORY RELAY	
• Carry out the delayed accessory relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Did the delayed accessory relay pass the component test?**	**Yes** GO to N4 . **No** INSTALL a new delayed accessory relay. TEST the system for normal operation.
N3 CHECK CIRCUIT CBP47 (GN/BU) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Smart Junction Box (SJB) C2280f. • Key in ON position. • Measure the voltage between SJB C2280f-32, circuit CBP47 (GN/BU), harness side and ground; and for Navigator, also measure the voltage between SJB C2280f-16, circuit CBP41 (BU), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR circuit CBP47 (GN/BU) or CBP41 (BU) for a short to voltage. TEST the system for normal operation. **No** GO to N4 .
N4 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all SJB connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Component Test

Grid Wire Test

1. Using a bright lamp in the vehicle, inspect the wire grid from the exterior. A broken grid wire will appear as a brown spot.

2. Run the engine at idle. Set the heated rear window switch to ON. The indicator light should come on.

3. Working in the vehicle with a voltmeter, contact the broad red-brown stripes of the rear glass window positive lead to battery side and the negative lead to ground side. The meter should read 10-13 volts. A lower voltage reading indicates a loose ground connection.

4. Contact a good ground point with the negative lead of the meter. The voltage reading should not change.

5. With the negative lead of the meter grounded, touch each grid line of the heated rear window glass at its midpoint with the positive lead. A reading of approximately 6 volts indicates the line is good. A reading of 0 volts indicates the line is broken between the midpoint and the B+ side of the grid line. A reading of 12 volts indicates the circuit is broken between the midpoint of the grid line and ground.

6. Pinpointing the exact position of the break can be accomplished (if the voltmeter reads 0 volts when the midpoint of the grid line is touched with the positive lead of the voltmeter) by moving the positive lead of the voltmeter toward the B+ side of the grid line and touching the grid line until the voltmeter reads 6 volts. If the voltmeter reads 12 volts when the midpoint of the grid line is touched with the positive lead of the voltmeter, simply move the positive lead of the voltmeter toward the ground connection of the grid line and touch the grid line until the voltmeter reads 6 volts.

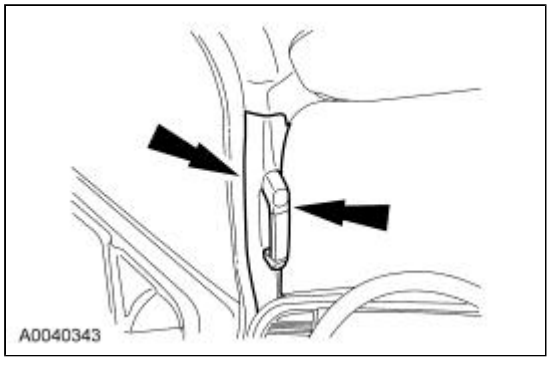
Windshield Reseal

Printable View (144 KB)

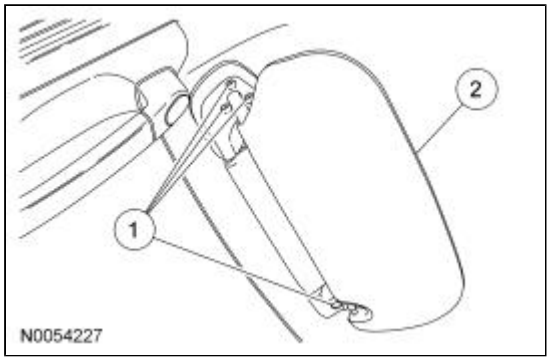
Material

Item	Specification
DOW AUTOMOTIVE 2-HOUR CURE	
Dow Urethane Adhesive Betaseal® Express	—
SIKA 2-HOUR CURE	
Sika Urethane Adhesive Sika Tack ASAP	—
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. Remove the cowl grille. For additional information, refer to Section 501-02 .
2. Remove the A-pillar trim panels.
   - Remove the bolt covers and bolts.



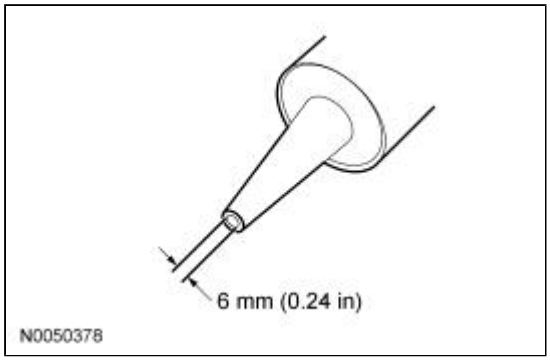
3. If equipped, remove the overhead console.
4. If equipped, remove the roof opening panel trim.
5. Remove the interior rear view mirror. For additional information, refer to Section 501-09 .
6. Remove the sun visors.
   1. Remove the 8 screws.
   2. Remove the 2 sun visor and visor arm clips.
      - If equipped, disconnect the electrical connectors.



7. Partially lower the front portion of the headliner near the windshield upper opening and block with a suitable material.

8. Clean the edge formed by the existing urethane and the glass on the inside at the top and sides, and outside on the bottom of the windshield with glass cleaner.

9. Cut the urethane applicator tip to specification.



10. **NOTE:** Use either a high-ratio electric or battery-operated caulk gun that will apply the urethane with less effort and a continuous bead.

    Apply a bead of urethane adhesive to the cleaned area.

11. **NOTE:** Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead.

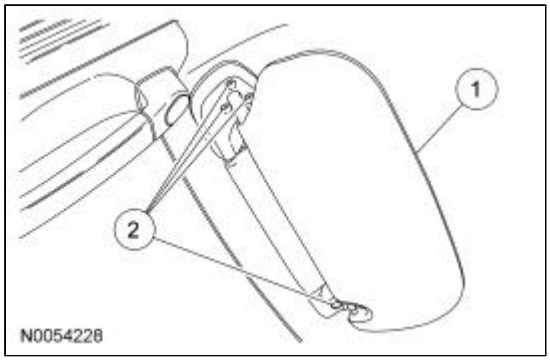
    Backfill the urethane application and clean the excess.

12. **CAUTION: The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.**

    After the urethane has cured, check the windshield seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.

13. Install the headliner.

14. Install the sun visors.
    1. Position the sun visors.
    2. Install the 8 screws.
        - If equipped, connect the electrical connectors.



15. Install the interior rear view mirror. For additional information, refer to Section 501-09 .
16. If equipped, install the roof opening panel trim.
17. If equipped, install the overhead console.
18. Install the A-pillar trim panels.
    - Install the bolts and covers.
19. Install the cowl grille. For additional information, refer to Section 501-02 .
20. Clean the interior and exterior of the windshield glass with glass cleaner.

Window Motor Initialization

Printable View (80 KB)

Window Motor Initialization

CAUTION: Make sure that no obstructions are present in the window system when carrying out this procedure.

NOTE: The LF/RF window motor is in proportional up/down mode until initialized.

NOTE: The LF/RF window motor must be reinitialized whenever: the motor is removed from window regulator drum housing, a new motor is installed, a new window regulator is installed, new window glass is installed, glass top run removal or installation or when carrying out any operation in which grease or lubricants are applied to the window system. Refer to the De-Initialization Procedure prior to performing this procedure (unless a new motor is being installed).

NOTE: All LF/RF window components (window glass, window regulator, window motor and glass top run) must be installed and tightened to specification before carrying out this procedure.

NOTE: If this procedure is only partially completed, the LF/RF window motor will remain un-initialized and only the proportional up/down functions will operate.

1. Start with the ignition key in the OFF position and with the LF/RF door open.
2. Turn the ignition key to the ON position.
3. Activate and hold the window control switch in the DOWN position until the window glass stalls for one second at the bottom of its travel and release the switch.
4. Activate and hold the window control switch in the UP position until the window glass stalls for one second into the glass top run and release the switch.
5. Verify correct operation of the LF/RF window by carrying out a one-touch down, one-touch up, proportional down and proportional up. If the window does not operate correctly, carefully repeat this procedure.

De-Initialization Procedure

NOTE: A motor which is initialized already (one-touch up and one-touch down are functional) must be de-initialized prior to carrying out the window motor initialization procedure.

1. Start with the ignition key in the RUN position and the LF/RF door open.
2. **NOTE:** Steps 2 and 3 must be performed within 8 seconds.

   Turn the ignition key from OFF to RUN 5 times.
3. Press the window control switch to the one-touch DOWN position (second detent) and release.
4. Verify that the window only performs proportional up and down movements. If the window still performs auto operations, carefully repeat this procedure.

Window Grid Wire Repair

Printable View (107 KB)

Material

Item	Specification
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A
Lacquer Touch-Up Paint (match color to exterior grid wire) PM-19500-XXXXX or PMP-19500-XXXXX	ESR-M2P100-C
Rear Window Defroster Repair PM-11 (US); CPM-11 (Canada)	—
Polypropylene Film Fine Line Tape (commercially available)	—

NOTE: If the first layer of the heated rear window grid (brown) is damaged or missing, it is necessary to apply touch up paint on the glass prior to applying the silver rear window defroster repair.

NOTE: The grid line material is not embedded into the glass but is baked to the glass surface and consequently can be scraped off. Inoperative lines may appear to the eye to be undamaged due to residue remaining on the glass and will require diagnosis with a voltmeter or 12V test lamp. For additional information, refer to Diagnosis and Testing in the section.

NOTE: An undamaged grid line will have small ridges that project above the surface of the glass and can easily be felt when running a fingernail across them. Grid lines that have been "razor bladed" will feel smooth when a fingernail is dragged across the affected area. There may be some residue left on the glass that appears to be grid material but a check with a voltmeter or 12V test lamp will confirm an open circuit.

NOTE: If the brown color under the grid line is damaged or missing (this is very rare), it will be necessary to apply lacquer touch-up paint for color match. This paint must meet specification and should be applied to the glass prior to applying the rear window defroster repair compound.

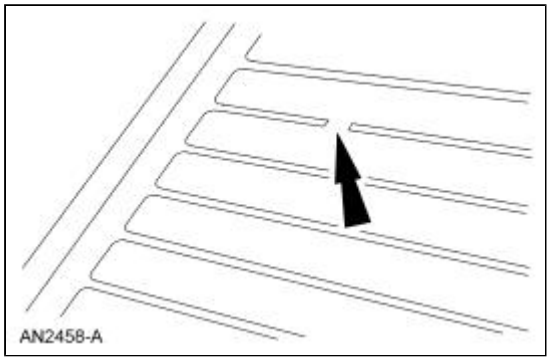
NOTE: The interior side of the grid lines are not painted, but due to the silver tarnishing will tend to change the grid to a gold or brown color. The repair area will be bright silver and will also tarnish over time to match the rest of the grid.

1. Bring the vehicle up to room temperature of at least 16°C (60°F) or above.

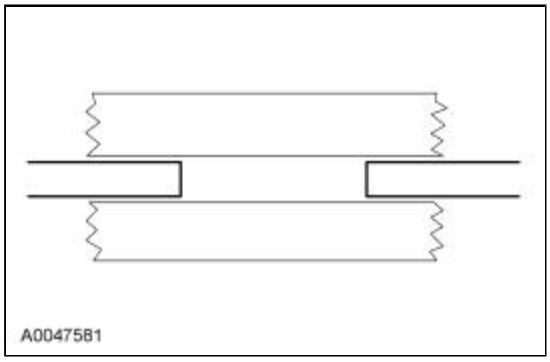
2. **NOTE:** Do not use scrapers, sharp instruments or abrasive window cleaners on the interior surface of the rear window glass as this may cause damage to the grid lines.

   Clean the entire grid line repair area with window cleaner and 0000 steel wool to remove all dirt, wax, grease, oil or other foreign material.

3. Mark the location of the grid break on the exterior of the rear window glass.



4. Using a polypropylene film fine line tape, mask the area directly above and below the grid break extending the tape 26 mm (1.02 in) beyond the concern area in both directions. The break area should be at the center of the mask.



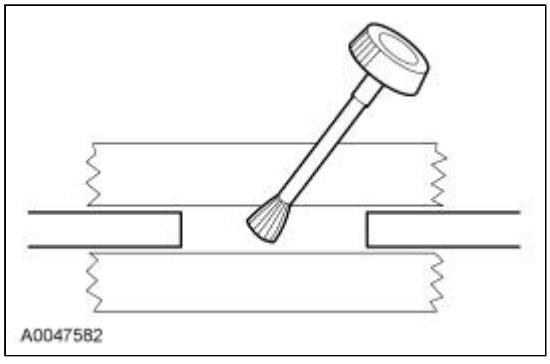
5. **NOTE:** If the brown layer is not broken or missing, apply only the silver grid repair compound to the break.

   NOTE: If both the brown and silver layers of the grid are broken or missing, apply a coating of the lacquer touch up paint across the break in the grid line first. Do not overlap the silver grid line with the paint. Several applications may be necessary to achieve a color match.

   NOTE: Extend the silver repair coating at least 6.35 mm (0.25 in) on both sides of the break area.

   NOTE: Allow at least 5 minutes of drying time between applications for the touch up paint or the silver repair coating. Applying fewer coats or not allowing adequate drying time between coats will produce repaired resistance that is greater than OEM resistance, resulting in poor defrost performance and excessive localized heating.

   Apply the repair coating to the grid break area in several smooth, continuous strokes.
   Apply a minimum of 6 applications of the grid repair compound.



6. After 5 minutes, or after the repair area has dried completely, remove the mask.

7. **CAUTION: Be careful not to damage the grid line with the razor blade. If this occurs, additional repair may be necessary.**

   Remove any excess repair compound above or below the grid line with a razor blade.

8. **NOTE:** The repair coating air-dries in approximately one minute and can be energized after 5 minutes.

   NOTE: Optimum adhesion occurs after approximately 24 hours.

   Test the system for normal operation.

Lead Terminal Repair

Printable View (90 KB)

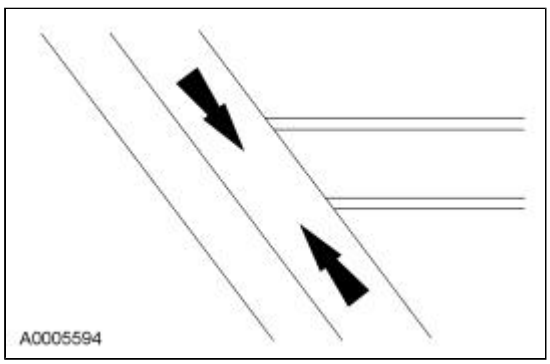
Material

Item	Specification
Terminal Kit — Back Glass 4F1Z-14421-AA	—
Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. **NOTE:** The rear window glass must be at least 16°C (60°F) (room temperature) at the time of the repair.

   NOTE: The new terminal will cover the original terminal location, but it must be placed so that the terminal conductive areas will be placed on a good conductive base.

   Clean the bus bar in the area to be repaired with steel wool (3.0 to 4.0 grade), and then with window cleaner to remove all dirt, wax, grease, oil or other foreign material.

2. **CAUTION: Do not use any type of flame torch or flame heated soldering gun for this procedure. Use of these tools provide inadequate heat generation at the tip and the exhaust heat can cause damage to plastic trim parts in the area. Use only an electric soldering gun with 100 watts or more of power. Before using the soldering gun, be sure to melt a small amount of rosin core solder to the tip. The solder will assist in achieving better heat transfer from the soldering gun tip to the new terminal.**

   NOTE: The new terminal has pre-applied solder, flux and temperature-sensitive paint. The paint provides a visual indication when the terminal has reached the correct temperature to melt solder on the terminal. When the correct temperature is achieved the temperature paint will liquefy and change color.

   NOTE: Depending on the original terminal location, and whether the terminal is covered by pillar trim, will determine where to locate the new terminal. Some grid line buss-bars may only allow the placement of the terminal above or below the original tab location due to space limitations. For most vehicle applications the replacement tab location will cover the original tab location but still allow the replacement tab to attach to the buss-bar on good conductive material.

   Place the replacement terminal type A over the original tab location, making sure the conductive areas of the terminal will be on a good conductive area. Do not place the terminal tab foot on the original location which does not have conductive material.

3. Hold the terminal in place with an item such as a regular lead pencil at a 90 degree angle from the terminal. (Holding at other than a 90 degree angle may allow the terminal to slip when the solder liquefies.)

4. Place the soldering gun tip on the top of the terminal but not on the painted areas of the tab. Energize the soldering gun and watch for the painted area of the terminal to liquefy and change color. The paint should liquefy in approximately 25-45 seconds after heating. As soon as the paint color completely changes on either side of the terminal, de-energize the soldering gun and continue to hold the terminal in place with the soldering gun and pencil for an additional 30 seconds.

5. Remove the soldering gun and pencil from the terminal. The terminal should be allowed to cool for another 2 minutes before the wiring lead is attached to the terminal.

6. Attach the electrical lead connection to this terminal, turn on the heated rear window and verify the operation.

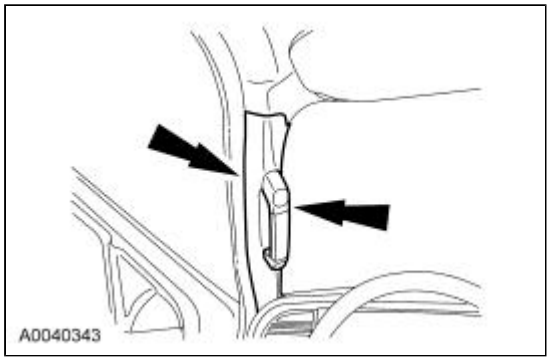
2	03110	Windshield top weatherstrip
3	03100	Windshield glass

Removal

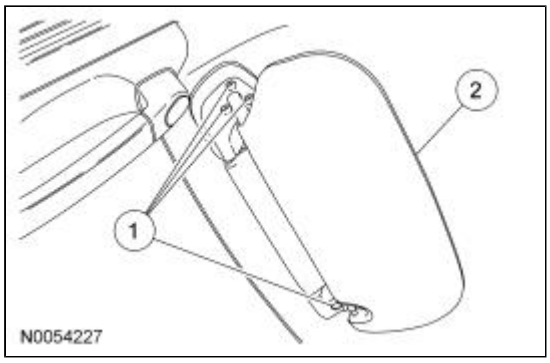
WARNING: To prevent glass splinters from entering eyes or cutting hands, wear safety glasses and heavy gloves when cutting glass from the vehicle.

1. Remove the cowl grille. For additional information, refer to Section 501-02 .
2. Remove the A-pillar trim panels.
   - Remove the bolt covers and bolts.



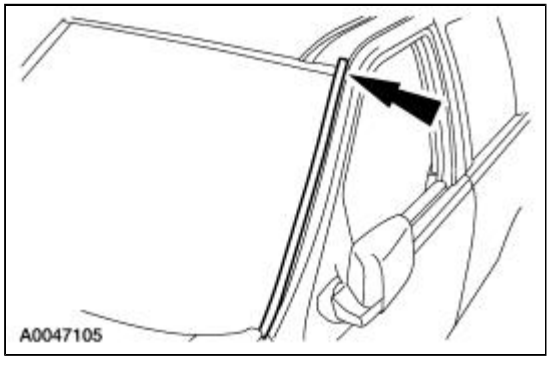
3. If equipped, remove the overhead console.
4. Remove the interior rear view mirror. For additional information, refer to Section 501-09 .
5. Remove the sun visors.

1. Remove the 8 screws.
2. Remove the 2 sun visor and visor arm clips.
    - If equipped, disconnect the electrical connectors.

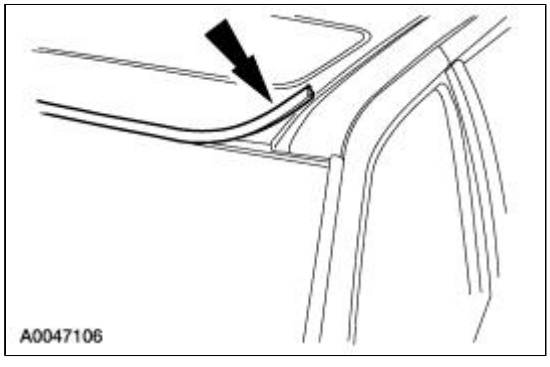


6. Lower the front portion of the headliner.

7. Remove the windshield side mouldings.
    - Pull out starting at the top corner.



8. Remove the upper windshield weatherstrip.
    - Pull out starting at the corner.



9. Mark the outside of the windshield glass with a wax pencil to avoid damaging the glass stops when cutting the urethane.

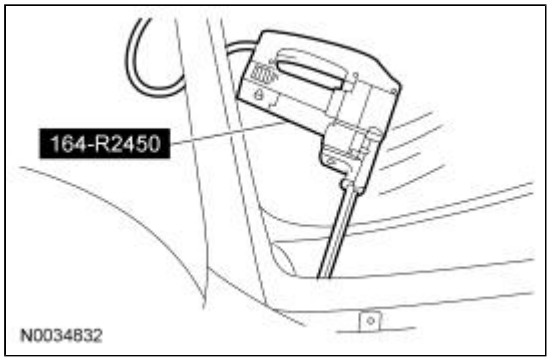
10. Using a soft brush or vacuum, remove any dirt and foreign material from the pinch weld.

11. **CAUTION: Care must be taken to avoid scratching the pinchweld.**

    NOTE: Lubricate the urethane adhesive with water to aid the special tool while cutting.

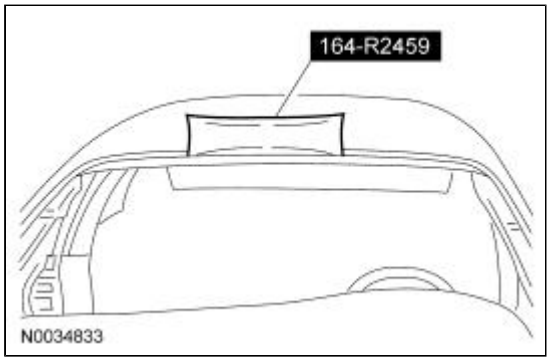
Using the special tool, cut the urethane adhesive from the windshield glass.

- Insert the blade into the urethane at the top middle of the glass and work toward the top corners.
- Insert the blade at the top corners and work down each side of the glass toward the bottom.



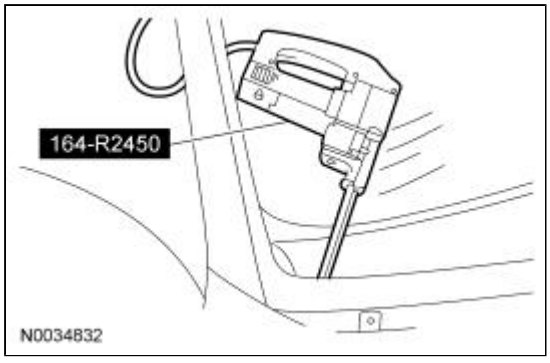
12. **CAUTION: Pump special tool 164-R2459 or equivalent slowly as cowl adhesive is cut to avoid breaking glass.**

    Using the special tool, distance the windshield from the body.



13. **NOTE:** Removing the windshield glass requires an assistant.

    Using the special tool, cut the remaining urethane adhesive and remove the windshield glass.



14. Using a soft brush or vacuum, remove any dirt and foreign material from the pinch weld.

Installation

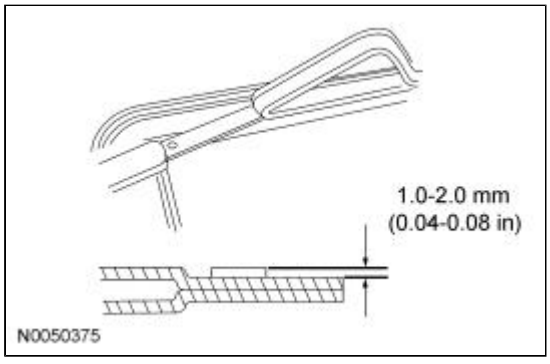
CAUTION: Do not drive the vehicle after installing windshield glass until the urethane adhesive has cured. Inadequate curing of the urethane adhesive adversely affects the strength of

the urethane adhesive bond.

1. Dry-fit the windshield glass by centering it side-to-side and by adjusting the setting blocks (if equipped) to get the correct position of the part top to bottom. Make the alignment marks with tape or non-staining grease pencil on both the glass and the vehicle body.

2. **CAUTION: Care must be taken to avoid scratching the pinch weld.**

   Trim the remaining urethane adhesive on the pinch weld to within specification.
   - The old urethane surface should be smooth and free of cuts and contamination.



3. If reinstalling the original windshield, remove excess urethane adhesive from the windshield glass.

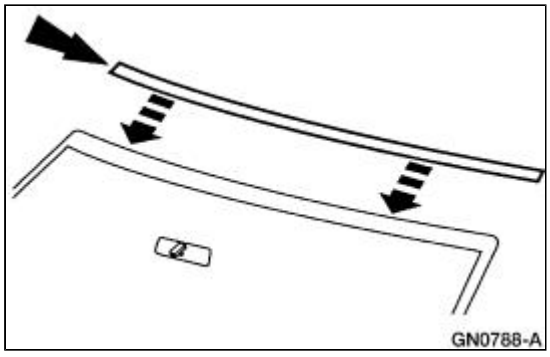
4. If installing a new windshield glass, clean the inside of the glass surface with glass cleaner to make sure the ceramic-coated area is clean.

5. **CAUTION: Be sure to use the same brand and cure-rate products for the adhesive and primer. Do not mix different brands of urethane and primer. Refer to the Material Chart in this procedure.**

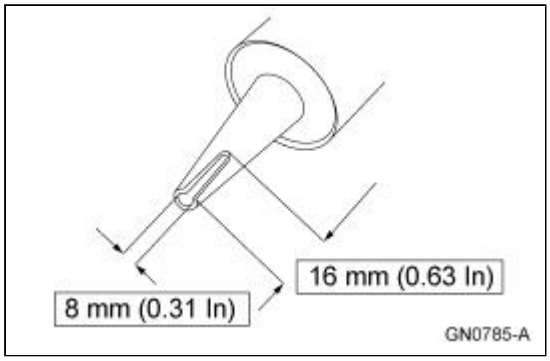
   NOTE: Sika uses the same black primer for the glass and pinch weld area.

   If installing a new windshield glass, apply urethane glass primer according to manufacturer's instructions. Allow at least 6 minutes to dry.

6. Install the upper windshield weatherstrip.

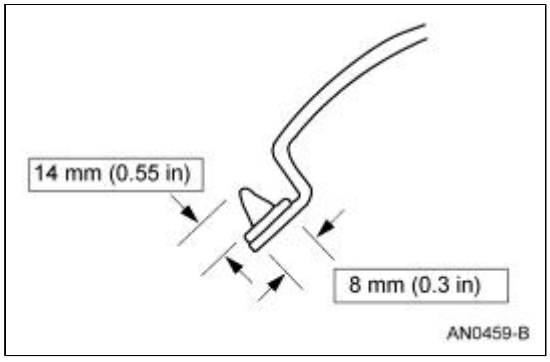


7. Cut the urethane applicator tip to specification.



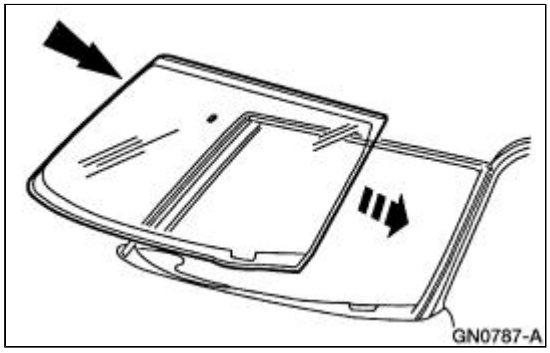
8. **CAUTION: Do not drive the vehicle after installing windshield glass until the urethane adhesive has cured. Inadequate curing of the urethane adhesive adversely affects the strength of the urethane adhesive bond.**

   Apply a bead of Urethane Adhesive to the pinch weld just outside the foam butyl dam over the top of the existing urethane bed.



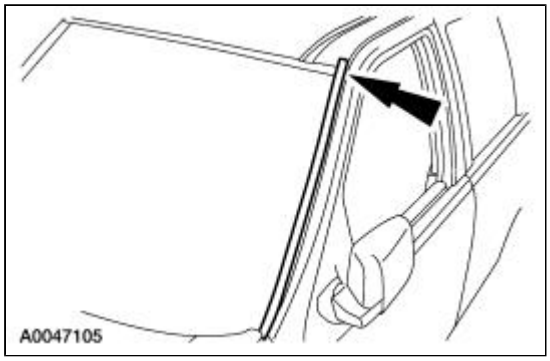
9. **CAUTION: Open the windows to prevent the windshield glass from being pushed out by air pressure if a door is closed.**

   Using the alignment marks, install the windshield glass.



10. Install the windshield side mouldings.

    NOTE: Be sure the moldings seat completely.

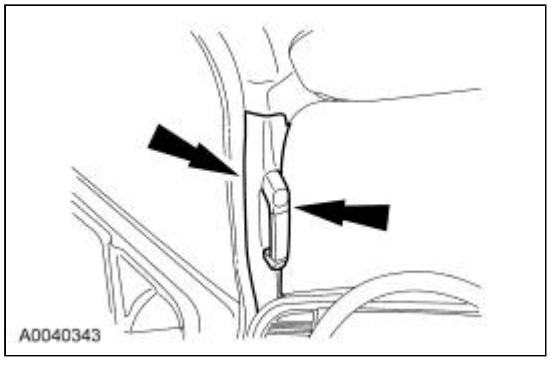


11. Install the headliner.

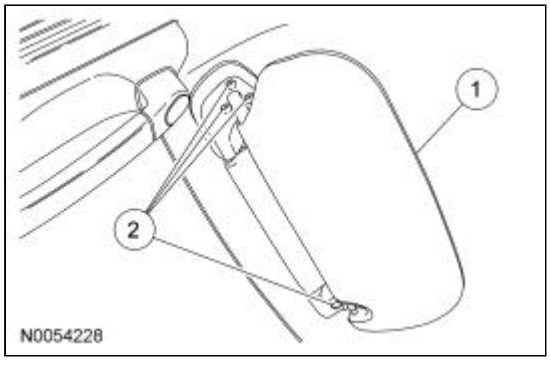
12. Install the interior rear view mirror. For additional information, refer to Section 501-09 .

13. Install the overhead console.

14. Install the A-pillar trim panels.
    - Install the bolts and covers.



15. Install the sun visors.
    1. Position the sun visors.
    2. Install the 8 screws.
        - If equipped, connect the electrical connectors.



16. Install the cowl grille. For additional information, refer to Section 501-02 .

17. Run the blower motor on defrost HIGH to check for glass that may have fallen into the defroster vents.

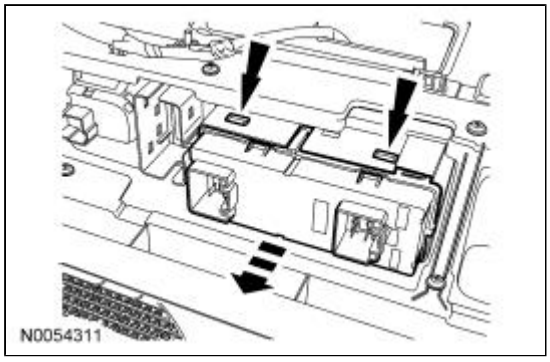
Window Control Switch

Printable View (114 KB)

Removal and Installation

NOTE: LF shown, all others similar.

1. Remove the door trim panel. For additional information, refer to Section 501-05 .
2. Unlock the tabs and remove the window control switch from the door trim panel.



3. To install, reverse removal procedure.

Glass, Frames and Mechanisms — Exploded View, Front Door

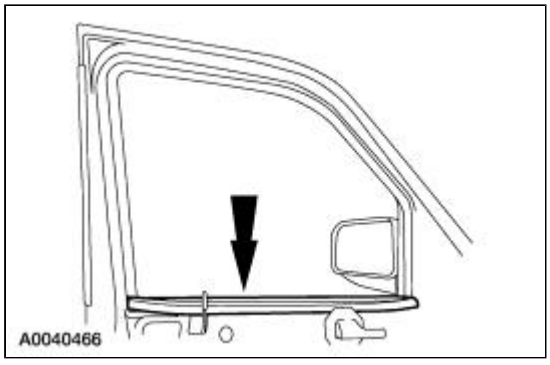
Printable View (96 KB)

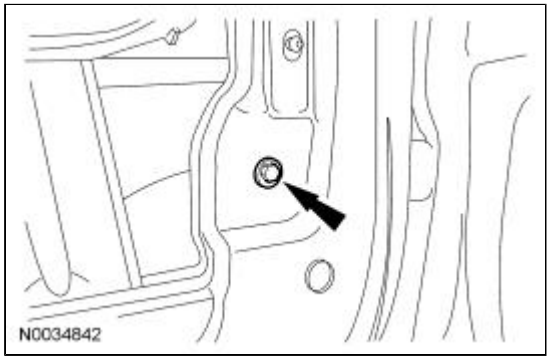
Removal and Installation

1. Remove the front door window glass. For additional information, refer to Window Glass — Front Door in this section.

2. Remove the inside glass weatherstrip.



3. Remove the front door glass channel bolt and front door glass top run.
   - To install, tighten to 11 Nm (8 lb-ft).



4. To install, reverse the removal procedure.

Window Glass — Front Door

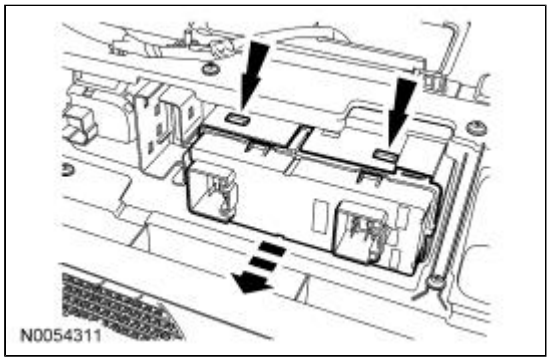
Printable View (247 KB)

Removal

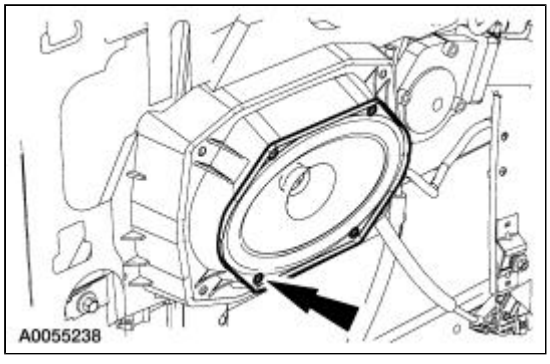
NOTE: For Navigator, the LF/RF door power window regulator motor must be reinitialized whenever the LF/RF motor is removed from the vehicle. For additional information, refer to Window Motor Initialization in this section.

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .

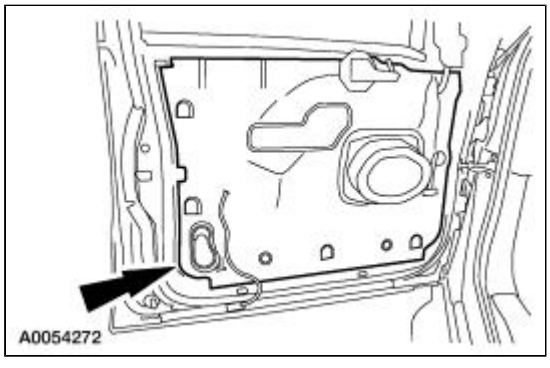
2. Unlock the tabs and remove the window control switch from the door trim panel.



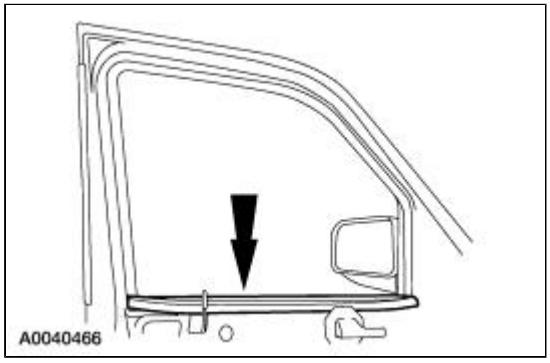
3. Remove the screws and the front door speaker.
   - Disconnect the electrical connector.



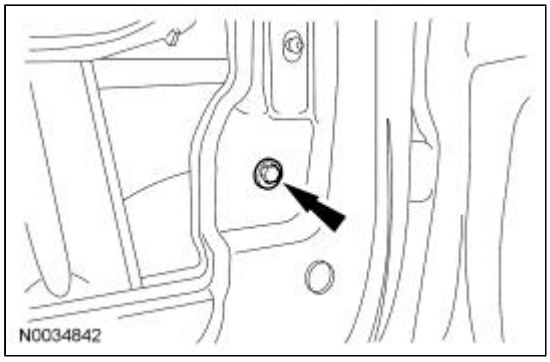
4. Remove the front door weathershield.



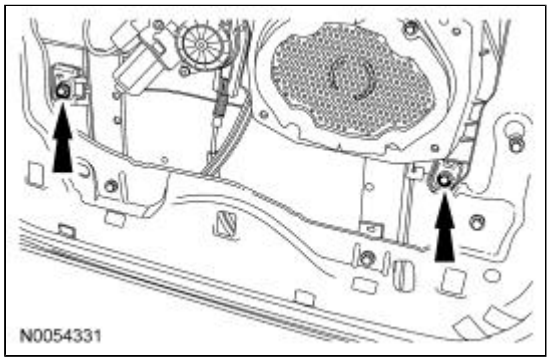
5. Re-connect the electrical connectors to the window control switch.
6. Lower the window glass to access the 2 window glass clamp bolts.
7. Remove the inside glass weatherstrip.



8. Remove the front door glass channel bolt and position aside the channel.

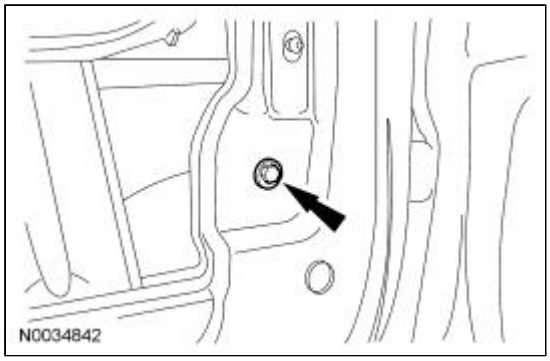


9. Loosen the window glass clamp bolts and remove the front door window glass.

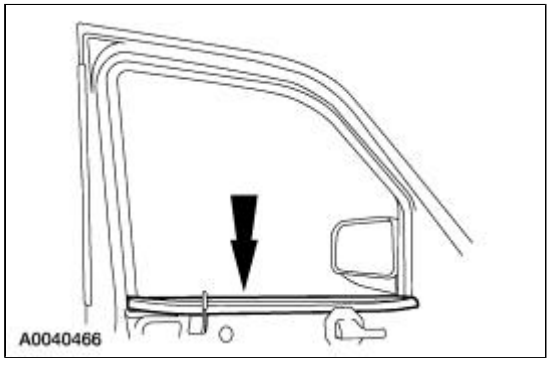


Installation

1. Install the front window glass but do not tighten the window glass clamp bolts.
2. Position the front door glass channel and tighten the bolt to 11 Nm (8 lb-ft).



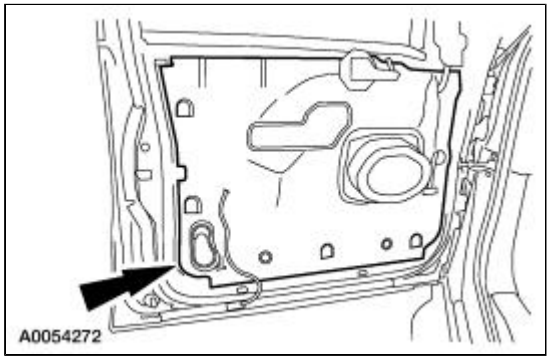
3. Install the inside glass weatherstrip.



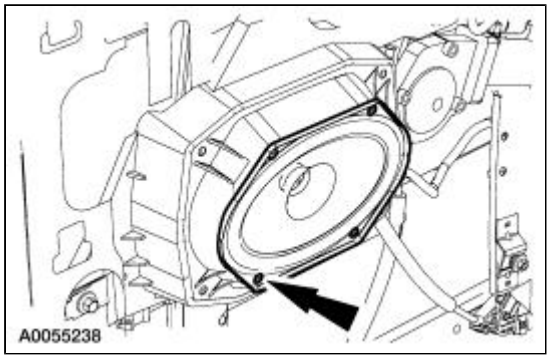
4. Raise the window glass until it stalls in the UP position. Tighten the window glass clamp bolts to 11 Nm (8 lb-ft).
    - For Navigator, the LF/RF door power window regulator motor must be reinitialized whenever the LF/RF motor is removed from the vehicle. For additional information, refer to Window Motor Initialization in this section.

5. Disconnect the window control switch electrical connectors and reinstall the switch into the door trim panel.

6. Install the front door weathershield.



7. Install the front door speaker.
    - Connect the electrical connector and install the screws.



8. Install the front door trim panel. For additional information, refer to Section 501-05 .

Window Regulator — Front Door

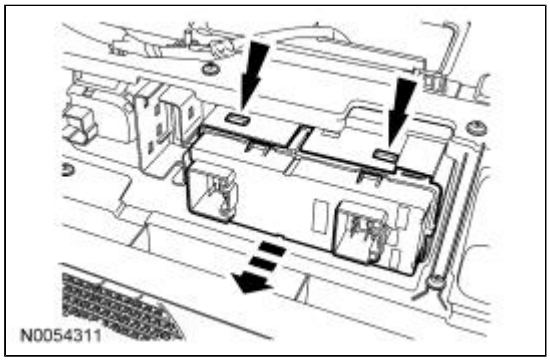
Printable View (357 KB)

Removal and Installation

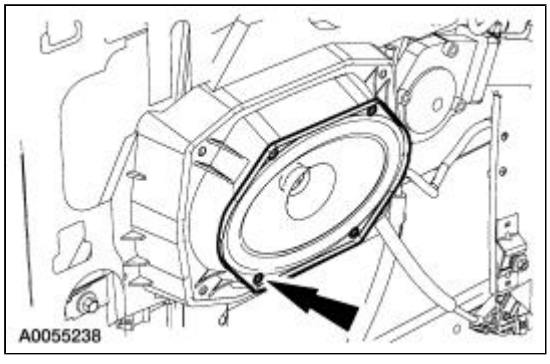
NOTE: For Navigator, the LF/RF door power window regulator motor must be reinitialized whenever the LF/RF window regulator is removed from the vehicle. For additional information, refer to Window Motor Initialization in this section.

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .

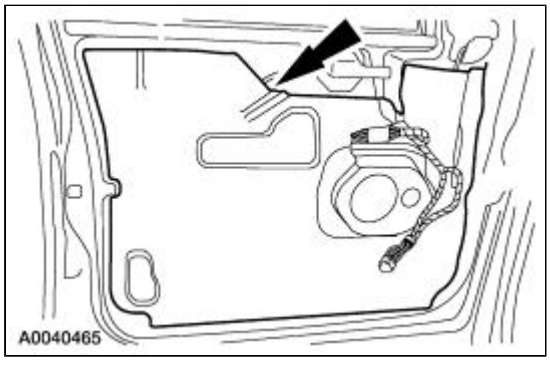
2. Unlock the tabs and remove the window control switch from the door trim panel.



3. Remove the screws and the front door speaker.
   - Disconnect the electrical connector.



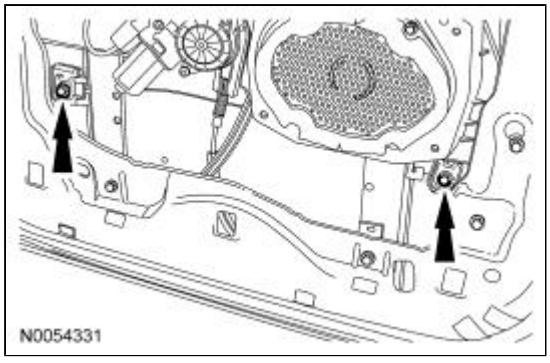
4. Remove the front door weathershield.



5. Re-connect the electrical connectors to the window control switch.

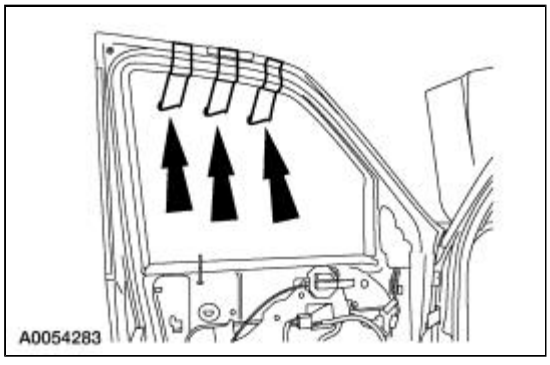
6. Lower the window glass to access the 2 window glass clamp bolts.

7. Loosen the window glass clamp bolts.
    - To install, raise the window glass until it stalls in the UP position. Tighten the window glass clamp bolts to 11 Nm (8 lb-ft).

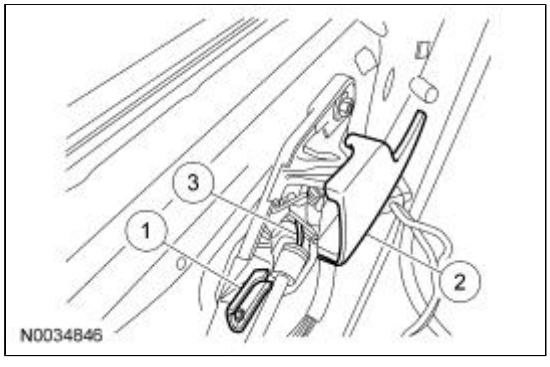


8. **NOTE:** Secure the front window glass in the full UP position.

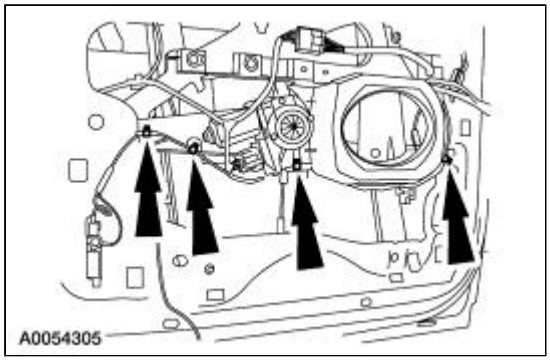
    Secure the front window glass with tape to the front door frame.



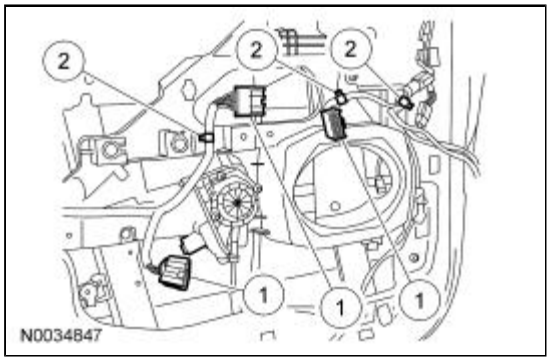
9. Position the interior door handle aside.
    1. Remove the cable conduit fitting from the carrier assembly.
    2. Lift upward on the interior door handle retaining bracket and pivot the interior door handle out of the bracket.
    3. Remove the cable from the door handle.



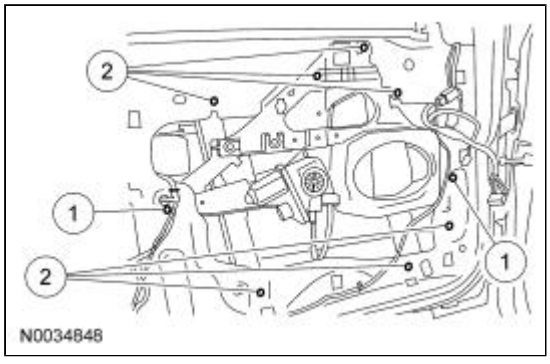
10. Release the crash sensor harness pin-type retainers.



11. Position the front door window regulator harness aside.
    1. Disconnect the electrical connectors.
    2. Release the pin-type retainers.



12. Remove the front window regulator.
    1. Loosen the 2 hanger bolts.
    2. Remove the front window regulator bolts and front top run channel bolt.
        - To install, tighten to 11 Nm (8 lb-ft).



13. To install, reverse the removal procedure.

14. For Navigator, reinitialize the LF/RF window regulator motor. For additional information, refer to Window Motor Initialization in this section.

Window Regulator Motor — Front Door

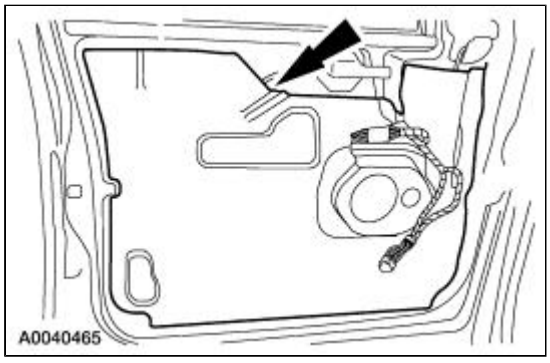
Printable View (135 KB)

Removal and Installation

NOTE: For Navigator, the LF/RF door power window regulator motor must be reinitialized whenever the LF/RF motor is removed from the vehicle. For additional information refer to Window Motor Initialization in this section.

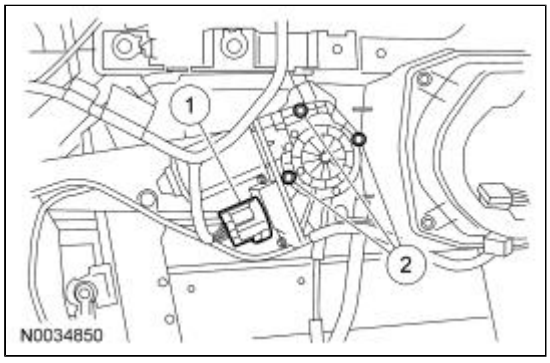
1. Remove the front door trim panel. For additional information, refer to Section 501-05 .

2. Position the front door weathershield aside.



3. **NOTE:** Use a flat-blade screwdriver between the window regulator motor and window regulator assembly to hold the window regulator assembly drum in place.

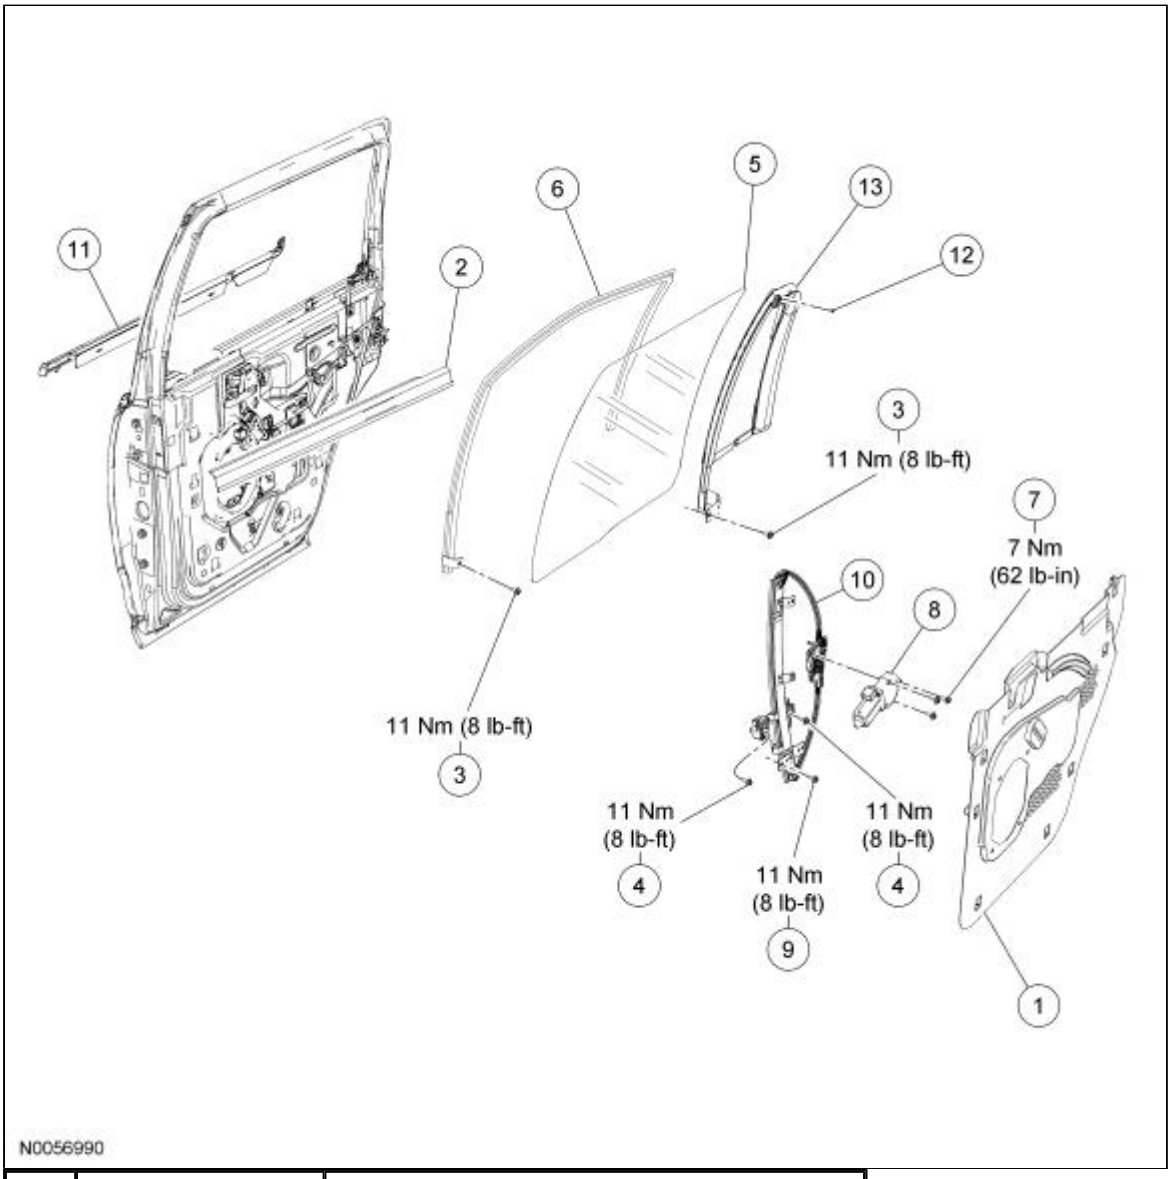
   Remove the bolts and the front door window regulator motor.
   1. Disconnect the electrical connector.
   2. Remove the bolts.
      - To install, tighten to 7 Nm (62 lb-in).



4. To install, reverse the removal procedure.
   - For Navigator, reinitialize the LF/RF window regulator motor. For additional information, refer to Window Motor Initialization in this section.
   - Cycle the window glass to make sure the gears engage.

Glass, Frames and Mechanisms — Exploded View, Rear Door

Printable View (174 KB)



Item	Part Number	Description
1	—	Rear door weathershield

3	W710330	Rear door top run channel bolts (2 required)
4	—	Window glass clamp bolts (PIA)
5	25712 RH/ 25713 LH	Rear door glass
6	25766 RH/ 25767 LH	Rear door top run
7	—	Rear door glass regulator motor bolts (3 required)

8	23394	Rear door glass regulator motor
9	W710330	Rear door glass regulator frame bolts (8 required)
10	27008	Rear door glass regulator assembly
11	25596	Outer glass weatherstrip
12	W504041-S437	Rear door vent glass frame screw
13	25828	Rear door vent glass assembly

1. For additional information, refer to the procedures in this section.

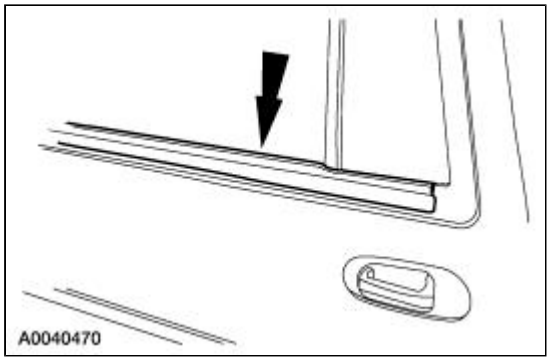
Window Glass — Fixed, Rear Door

Printable View (95 KB)

Removal and Installation

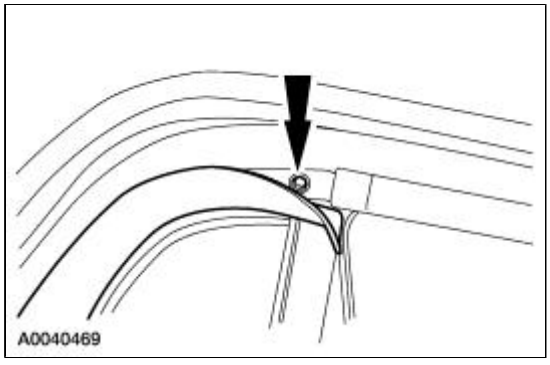
1. Remove the rear door window glass. For additional information, refer to Window Glass — Rear Door in this section.

2. Remove the rear door exterior glass moulding.

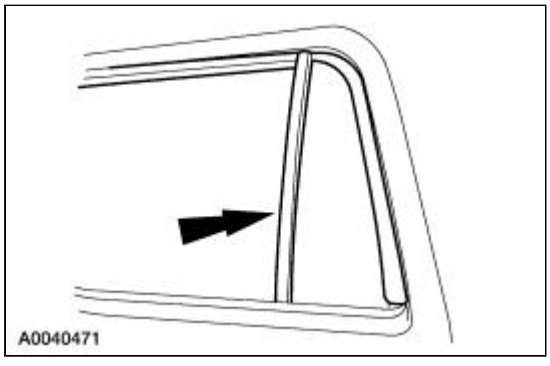


3. Remove the rear door glass top run. For additional information, refer to Door Glass Top Run — Rear in this section.

4. Remove the rear door stationary glass screw.



5. Remove the stationary rear door glass.



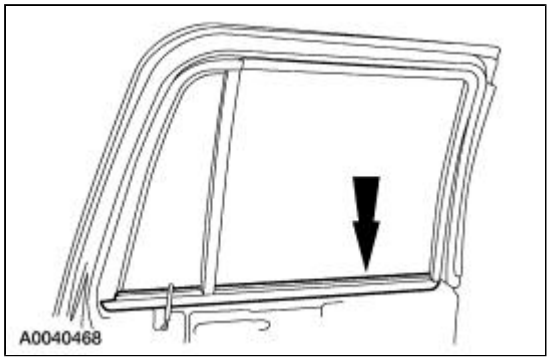
6. To install, reverse the removal procedure.

Door Glass Top Run — Rear

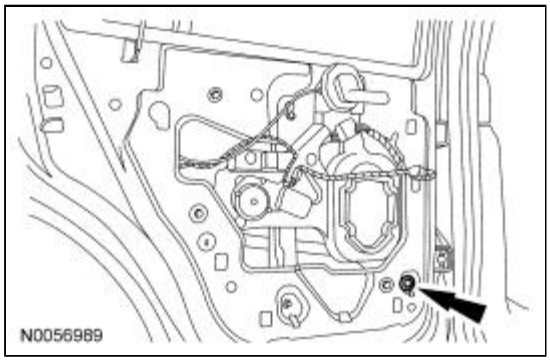
Printable View (114 KB)

Removal and Installation

1. Lower the rear door window glass.
2. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
3. Remove the inside glass weatherstrip.



4. Remove the rear door glass channel bolts.
   - To install, tighten to 11 Nm (8 lb-ft).



5. Remove the rear door glass top run.
6. To install, reverse the removal procedure.

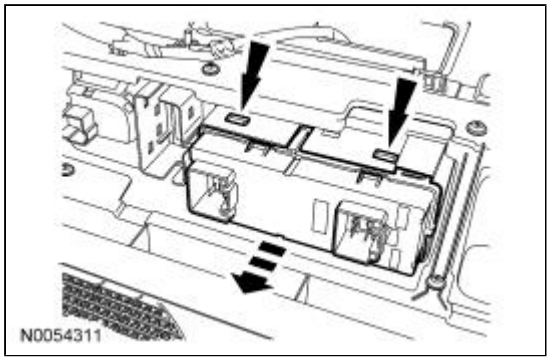
Window Glass — Rear Door

Printable View (186 KB)

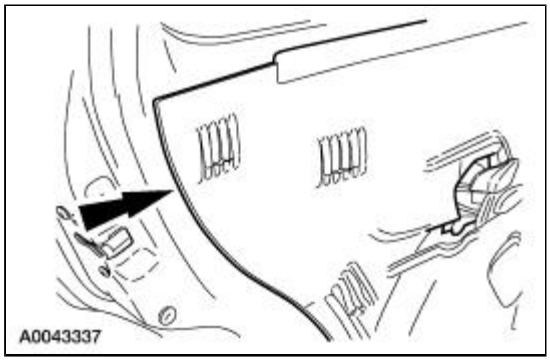
Removal and Installation

1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. **NOTE:** LF shown, LR and RR are similar.

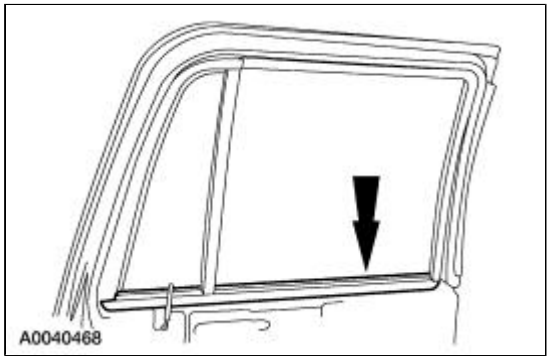
   Unlock the tabs and remove the window control switch from the door trim panel.



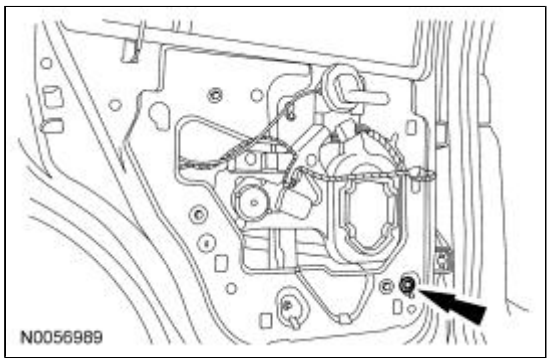
3. Position back the rear door weathershield.



4. Connect the window control switch.
5. Lower the window glass to access the window glass clamp bolts.
6. Remove the inside glass weatherstrip.



7. Remove the rear door glass channel bolt.
    - To install, tighten to 11 Nm (8 lb-ft).



8. Loosen the window glass clamp bolts and remove the rear door window glass.
    - To install, tighten to 11 Nm (8 lb-ft).

9. To install, reverse the removal procedure.

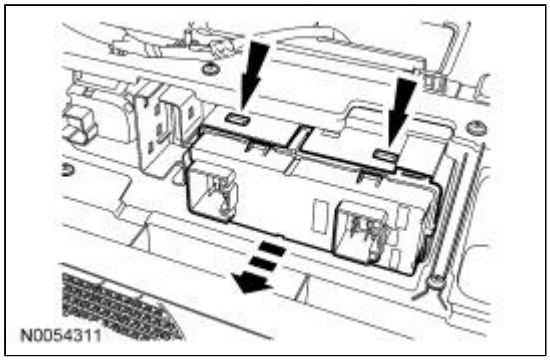
Window Regulator — Rear Door

Printable View (254 KB)

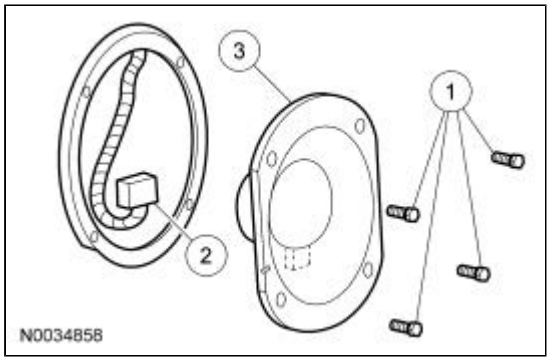
Removal and Installation

1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. **NOTE:** LF shown, LR and RR are similar.

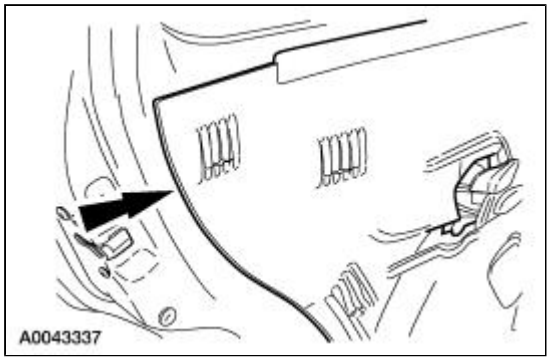
   Unlock the tabs and remove the window control switch from the door trim panel.



3. Remove the rear door speaker.
   1. Remove the screws.
   2. Disconnect the electrical connector.
   3. Remove the speaker.

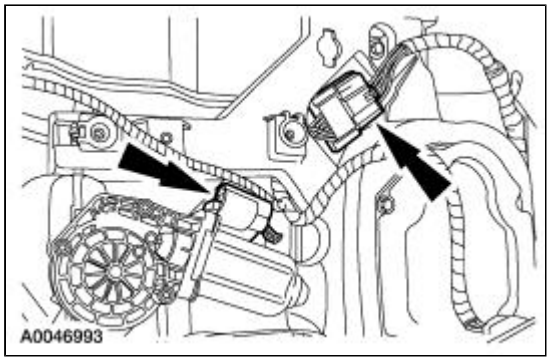


4. Remove the rear door weathershield.

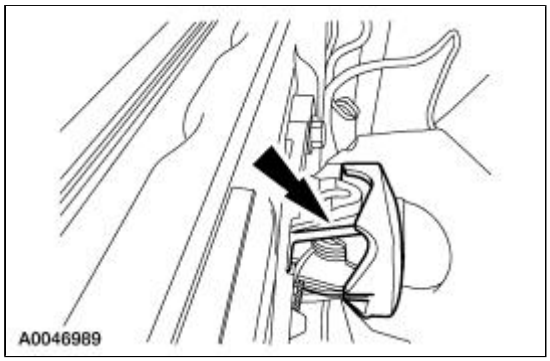


5. Connect the window control switch.
6. Lower the window glass to access the window glass clamp bolts.
7. Disconnect the window control switch.
8. Loosen the window glass clamp bolts and remove the rear door window glass.
    - To install, tighten to 11 Nm (8 lb-ft).
9. **NOTE:** Secure the rear window glass in the full UP position.

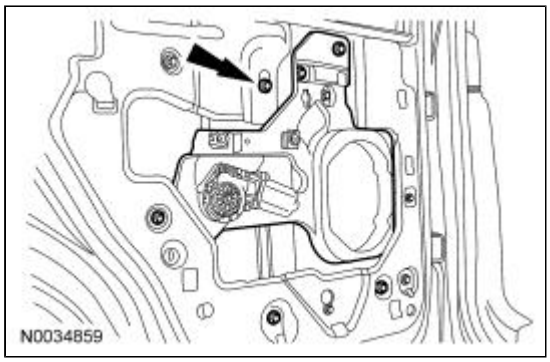
    Secure the rear window glass with tape to the front door frame.
10. Disconnect the rear door window regulator electrical connectors.



11. Position the interior door handle aside.
    - Lift upward on the interior door handle retaining bracket and pivot the interior door handle out of the bracket.



12. Remove the rear door window regulator assembly.
    - Remove the bolts.
        - To install, tighten to 11 Nm (8 lb-ft).



13. To install, reverse the removal procedure.

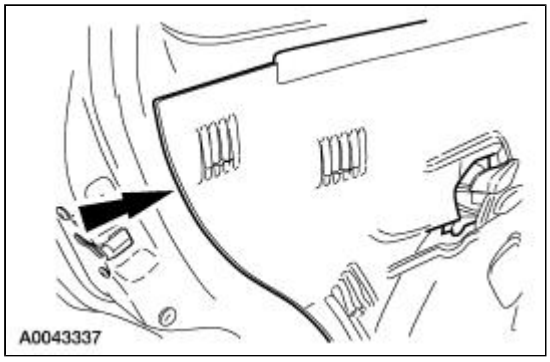
Window Regulator Motor — Rear Door

Printable View (140 KB)

Removal and Installation

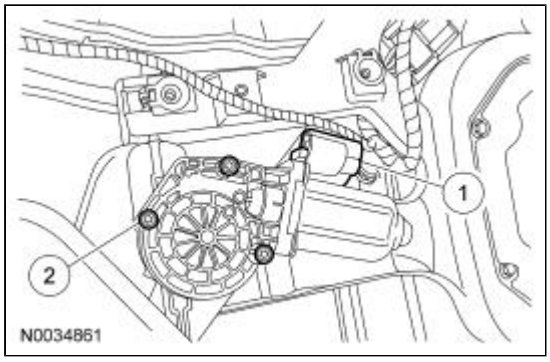
1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .

2. Position the rear door weathershield aside.



3. **NOTE:** Use a flat-blade screwdriver between the window regulator motor and the window regulator assembly to hold the window regulator assembly drum in place.

   Remove the rear door window regulator motor.
   1. Disconnect the electrical connector.
   2. Remove the bolts.
      - To install, tighten to 7 Nm (62 lb-in).



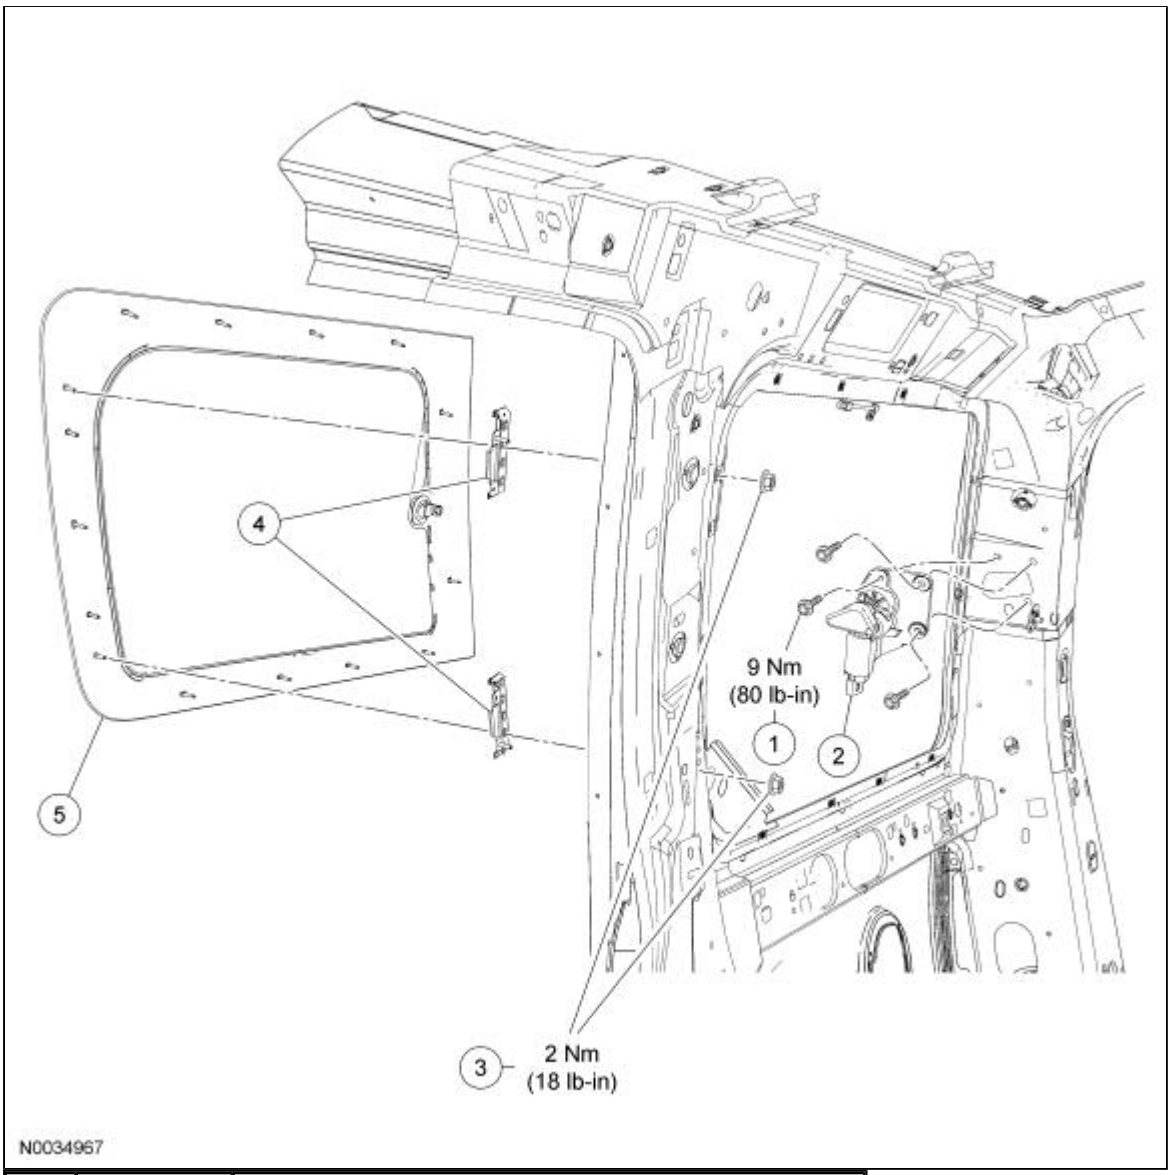
4. To install, reverse the removal procedure.
   - Cycle the door glass to make sure of gear engagement.

Window Glass — Rear Quarter

Printable View (345 KB)

Material

Item	Specification
Foam Core Butyl E69Z-19562-A	WSB-M3G143-B1



Item	Part Number	Description
1	—	Rear quarter window regulator motor bolts (3 required)
2	30306	Rear quarter window regulator assembly
3	N621901	Rear quarter window glass nuts (15 required)

4	—	Rear quarter window hinge assembly (serviced with quarter glass assembly)
5	29600	Rear quarter window glass assembly

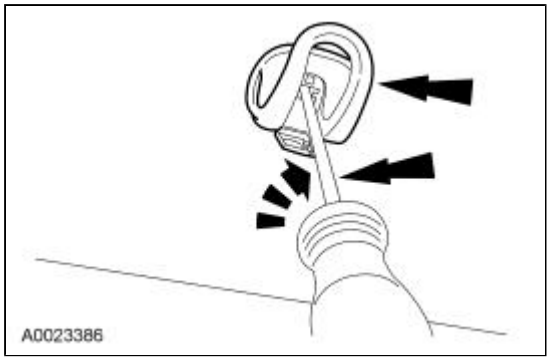
Removal

All vehicles

1. Remove the rear quarter trim panel. For additional information, refer to Section 501-05 .

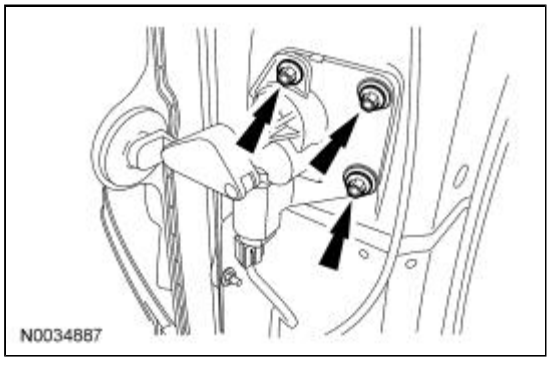
2. **CAUTION: To prevent damage to the coat hanger retainer, use a 3/16-inch flat-blade screwdriver for this step.**

   Remove the front and rear coat hooks and lower the headliner over the rear quarter window glass.
   - Open the access cover.
   - Insert a screwdriver into the coat hook slot and turn the screwdriver 90 degrees so that it engages in the plastic component slot. This will spread the steal attachment clip wings to allow the plastic component to disengage.



Vehicles with power vent window

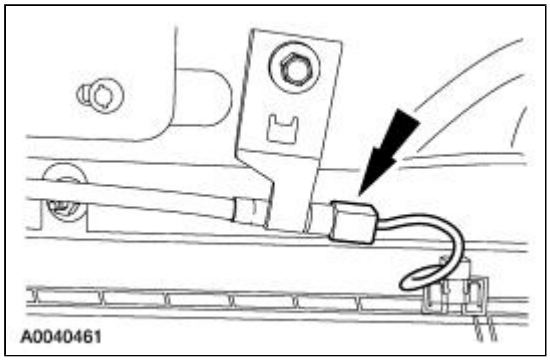
3. Remove the bolts and rear quarter window regulator motor.
   - Disconnect the electrical connector.



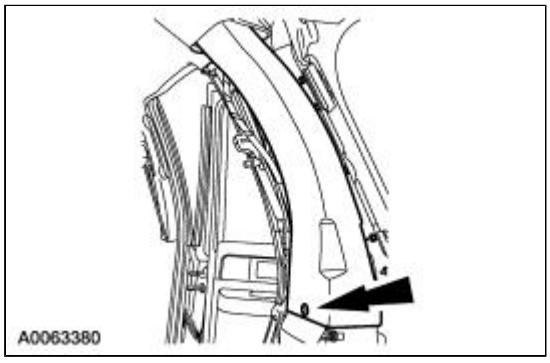
4. Disconnect the rear quarter window regulator.

All vehicles

5. Disconnect the audio antenna.

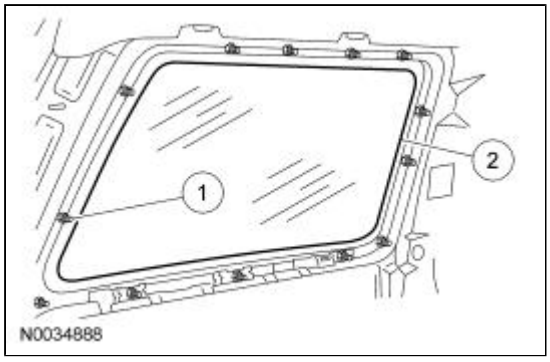


6. If equipped, remove the air duct.
    - Remove the pin-type retainer.

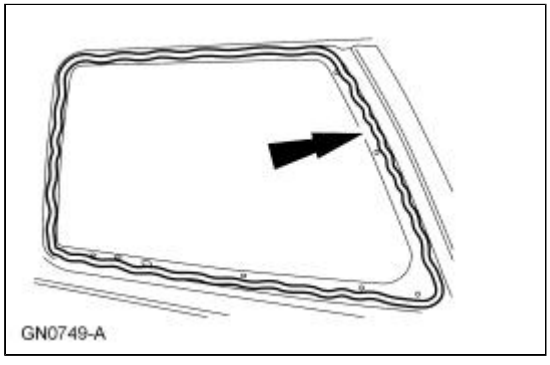


7. **CAUTION: Have an assistant hold the rear quarter window glass.**

    Remove the rear quarter window glass.
    1. Remove the nuts.
    2. Remove the rear quarter window glass.



8. Remove the excess foam core butyl from the window opening.

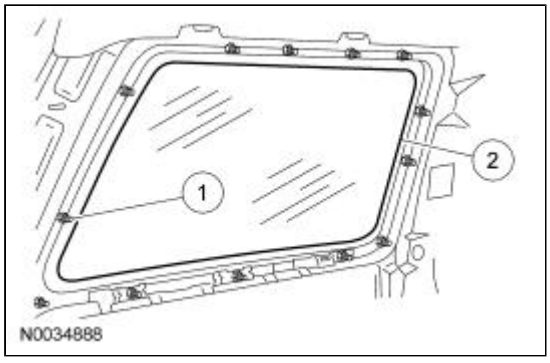


Installation

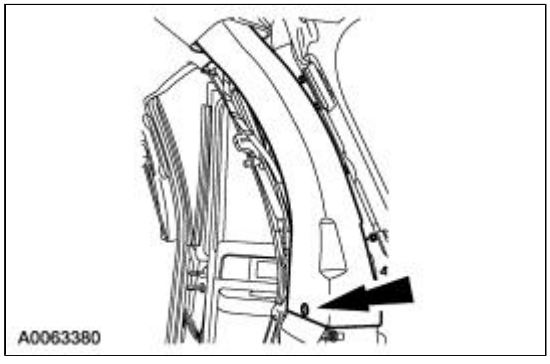
All vehicles

1. Apply 8 mm (0.32 in) Foam Core Butyl or equivalent meeting Ford specification WSB-M3G143-B1 to the rear quarter window glass frame.
    - Start at the bottom middle and work around the frame.

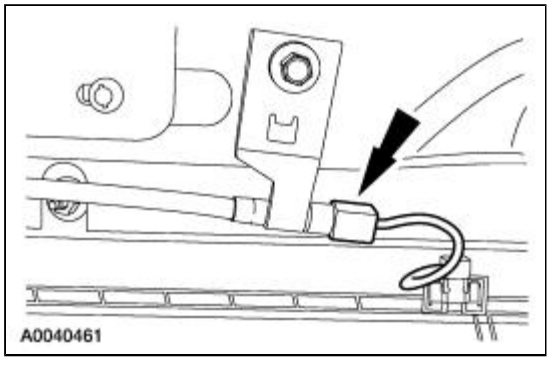
2. Install the rear quarter window glass.
    1. Position the rear quarter window glass.
    2. Install the rear quarter window glass nuts.
    - Tighten to 2 Nm (18 lb-in).



3. If equipped, install the air duct.
    - Install the pin-type retainer.

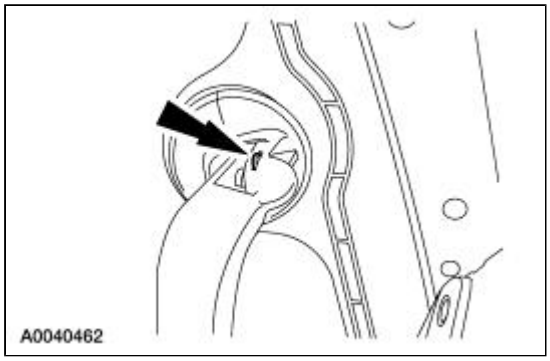


4. Connect the audio antenna.

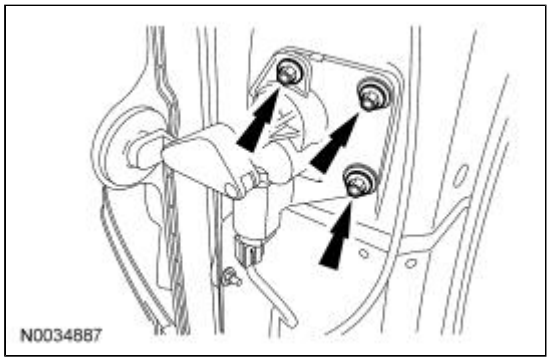


Vehicles with power vent windows

5. Install the rear quarter window regulator.



6. Install the bolts and rear quarter window regulator motor.
    - Tighten to 9 Nm (80 lb-in).
    - Connect the electrical connector.



All vehicles

7. Position the headliner and install the coat hooks.

8. Install the rear quarter trim panel. For additional information, refer to Section 501-05 .

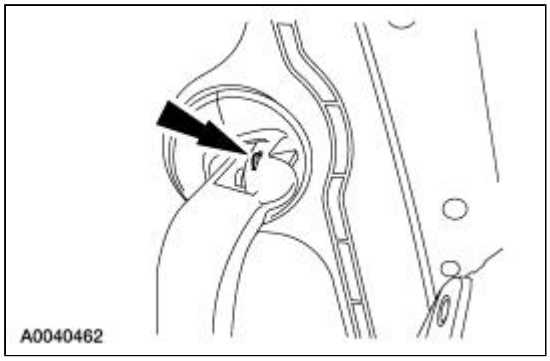
Window Regulator Motor — Rear Quarter

Printable View (109 KB)

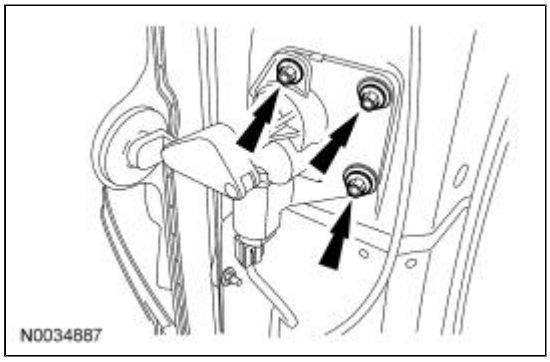
Removal

1. Remove the D-pillar trim panel. For additional information, refer to Section 501-05 .

2. Disconnect the rear quarter window regulator motor.
   - Remove the retaining clip.



3. Remove the bolts and rear quarter window regulator motor.
   - To install, tighten to 9 Nm (80 lb-in).
   - Disconnect the electrical connector.



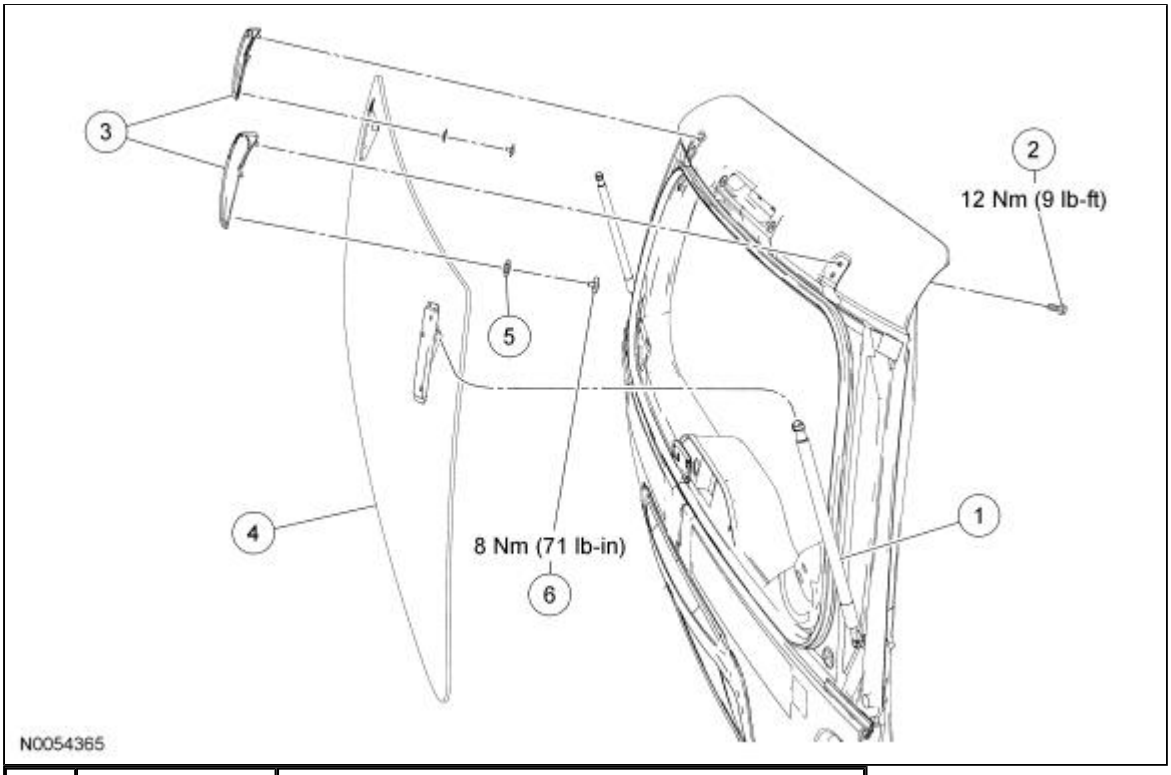
4. To install, reverse the removal procedure.

Window Glass — Liftgate

Printable View (222 KB)

Material

Item	Specification
Threadlock 262 TA-26	WSK-M2G351-A6

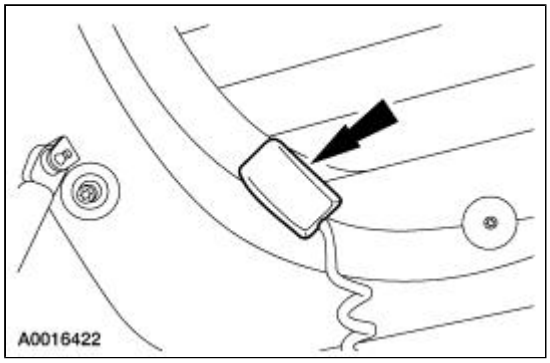


Item	Part Number	Description
1	42104	Liftgate glass assist cylinders (2 required)
2	W712536-S439	Liftgate glass hinge-to-body fastener (2 required)
3	420A68	Liftgate glass hinge assembly (2 required)
4	422A12	Liftgate glass assembly
5	40610	Nylon spacer
6	—	Liftgate glass-to-hinge bolt

Removal and Installation

Window glass assembly

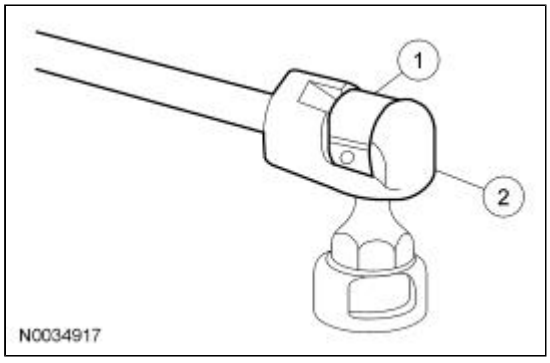
1. Remove the rear window wiper motor. For additional information, refer to Section 501-16 .
2. Disconnect the rear window defrost electrical connectors.



3. **CAUTION: The liftgate glass must be supported when removing and installing the liftgate assist cylinders.**

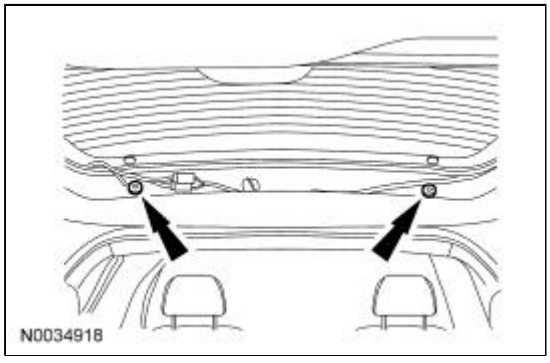
   CAUTION: Do not extend the socket clips more than 2.0 mm (0.08 in) or failure of the socket can occur.

   Disconnect the 2 liftgate glass assist cylinders.
   1. Insert a screwdriver blade under the socket clip and lift.
   2. Gently pull the socket off the ball stud.



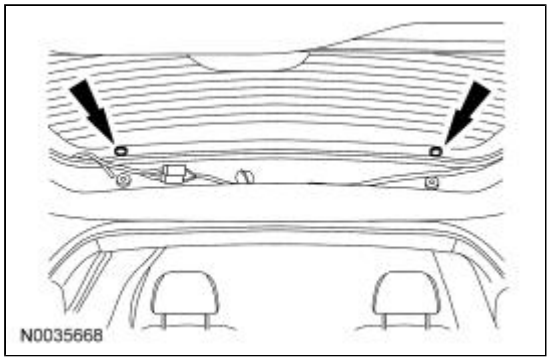
Window glass assembly or hinge assembly

4. Remove the liftgate glass hinge-to-body fasteners and remove the glass.
   - To install, tighten to 12 Nm (9 lb-ft).



Window hinge assembly

5. Remove the liftgate glass to hinge fasteners and remove the glass.
   - Apply Threadlock 262 to the liftgate glass to hinge fasteners during installation.
   - To install, tighten to 8 Nm (71 lb-in).



Window glass assembly or window hinge assembly

6. To install, reverse the removal procedure.

Printable View (65 KB)

Torque Specifications

Description	Nm	lb-ft	lb-in
Assist handle bolts	6	—	53
Bulkhead electrical connector bolts	3	—	27
Front floor console screws	7	—	62

Steering column reinforcement panel bolts	9	—	80

Instrument Panel

Printable View (63 KB)

The instrument panel consists of the following components:

- Instrument panel cluster finish panel
- Instrument panel defroster grille
- Analog clock (Navigator only)
- Instrument cluster
- Radio
- Climate control assembly
- Power points
- Instrument panel side finish panels
- Glove compartment
- Instrument panel center finish panel
- Instrument panel steering column cover
- Steering column reinforcement panel
- Switches: headlamp, dimmer, message center, power liftgate and hazard lights
- Audio input jack

Console — Front, Floor

Printable View (62 KB)

The front floor console may consist of the following components:

- A/C integral control assembly
- Auxiliary A/C controls
- Auxiliary power point
- Center console finish panel
- Console finish panel mat
- Shift lever
- Cup holders
- Audio input jack (Navigator only)
- Rear audio controls
- Satellite radio module and antenna

Console — Rear, Floor

Printable View (62 KB)

The rear console consists of the following components:

- Armrest
- Cup holders
- Storage bin

Console — Overhead

Printable View (62 KB)

There are 2 versions of the overhead console, with and without the roof opening panel.

The overhead console with the roof opening panel may contain the following:

- Climate controls (optional)
- Map lamps/switches
- Roof opening panel switch
- Rear quarter window switches (optional)

The overhead console without the roof opening panel may contain the following:

- Climate controls (optional)
- Glasses storage bin
- Map lamps/switches
- Rear quarter window switches (optional)
- Storage bin

1. For additional information, refer to the procedures in this section.

Instrument Panel

Printable View (1184 KB)

CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

All vehicles

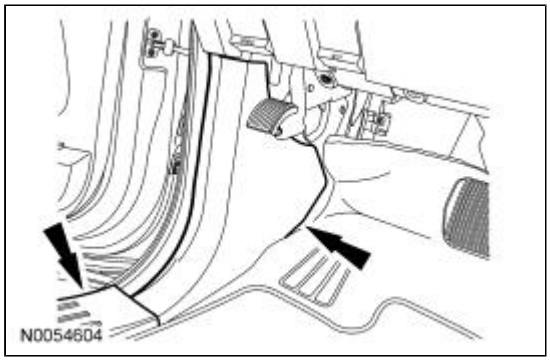
1. If equipped with adjustable pedals, move the pedals to the full forward position.

2. If equipped, remove the front floor console. For additional information, refer to Console — Front, Floor, Navigator or Console — Front, Floor, Expedition in this section.

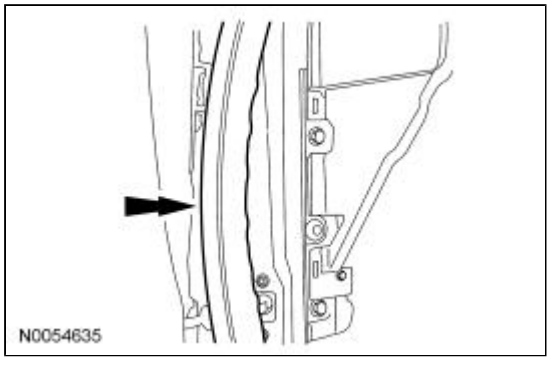
3. Depower the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

4. If equipped, remove the RH instrument panel insulator.
   - Disconnect the instrument panel insulator lamp.

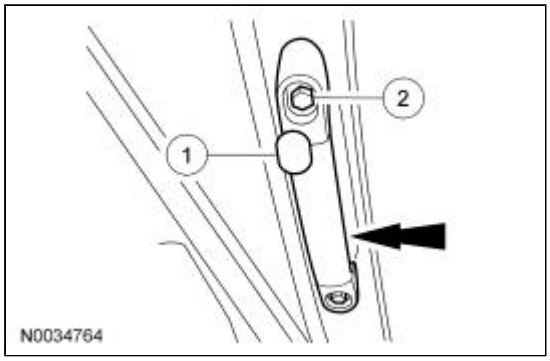
5. Remove the LH and RH cowl trim panels.
   - Remove the scuff plate.
   - Remove the cowl trim panel.



6. Position the LH and RH door weatherstrip seals aside.

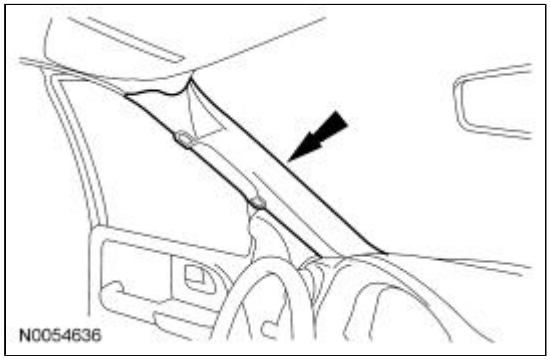


7. Remove the LH and RH assist handles.
   1. Remove the covers.
   2. Remove the bolts.
      - To install, tighten to 6 Nm (53 lb-in).



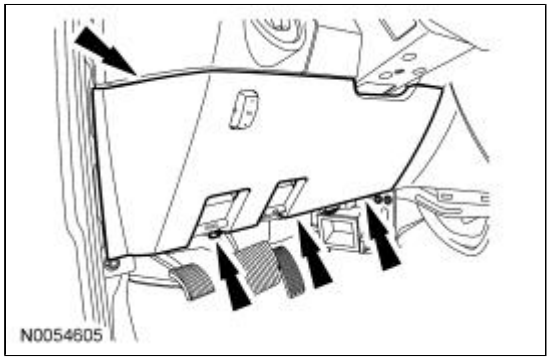
8. **NOTE:** Release the top attachments by pulling inboard first and then upward to release the lower hook.

   Remove the LH and RH A-pillar trim panels.

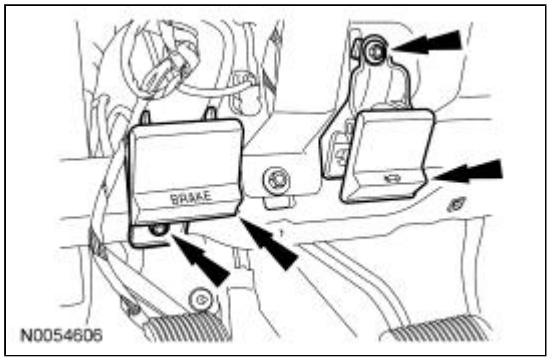


Navigator only

9. Remove the instrument panel steering column cover.
   - Remove the screws.
   - Release the cover from the instrument panel.
   - Disconnect the electrical connector, if equipped.

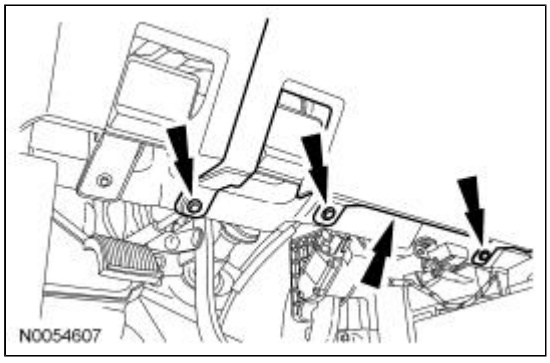


10. Position the hood release and parking brake release handles aside.
    - Remove the screws.
    - Position the release handles aside.
      - To install, tighten to 9 Nm (80 lb-in).



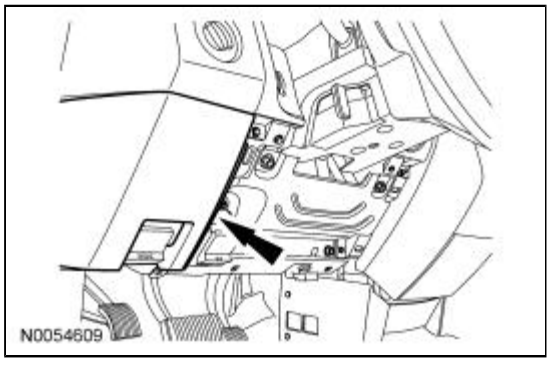
Expedition only

11. Remove the instrument panel steering column cover.
    - Remove the screws.
    - Release the cover from the instrument panel.

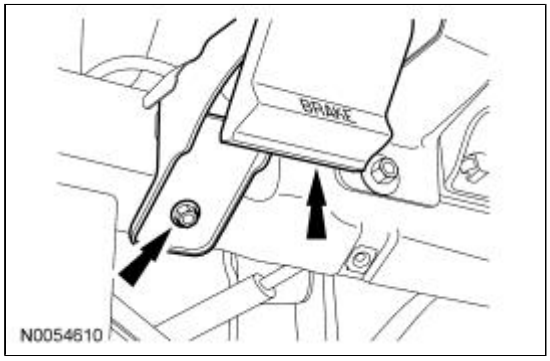


12. Remove the hood release handle bolt and position aside.
    - To install, tighten to 9 Nm (80 lb-in).

13. Remove the instrument panel lower cover.



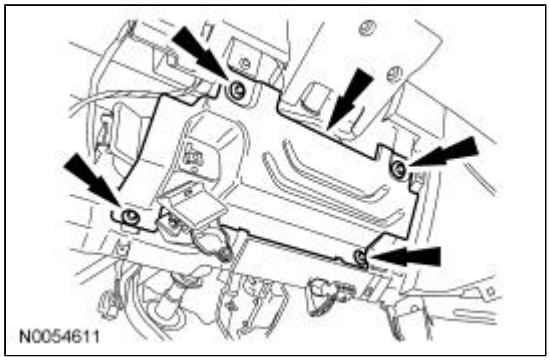
14. Remove the bolt from the parking brake handle and position aside.
    - To install, tighten to 9 Nm (80 lb-in).



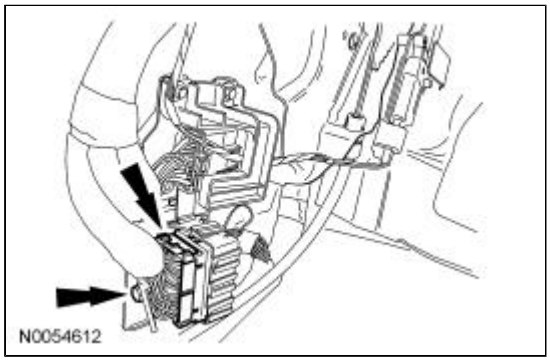
All vehicles

15. **NOTE:** Navigator shown, Expedition similar.

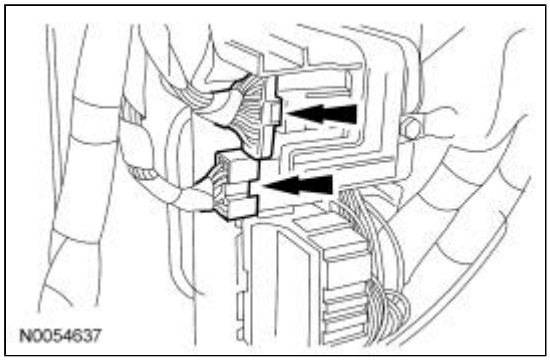
    Remove the bolts and the steering column reinforcement panel.
    - To install, tighten to 9 Nm (80 lb-in).



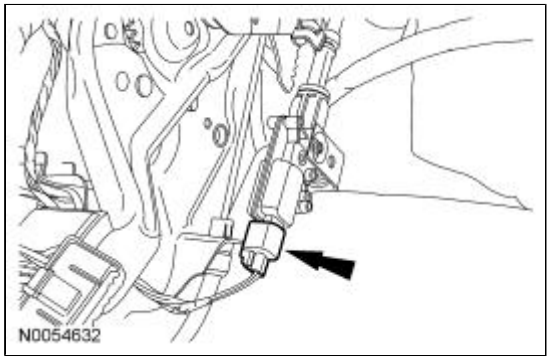
16. Loosen the bolt and disconnect the LH instrument panel bulkhead connector.
    - To install, tighten to 5 Nm (44 lb-in).



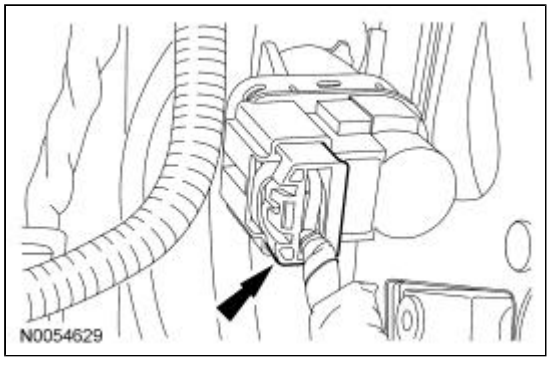
17. Disconnect the LH electrical connectors.



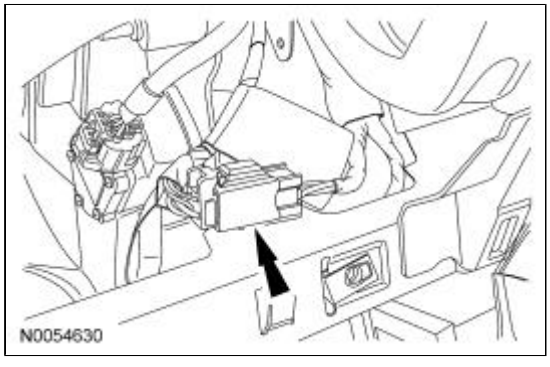
18. Disconnect the park brake indicator connector.



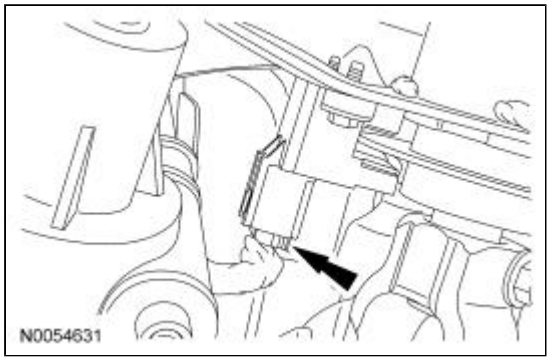
19. Disconnect the cruise control deactivator and the brake on/off switch electrical connector.



20. Disconnect the electrical connector located above the data link.

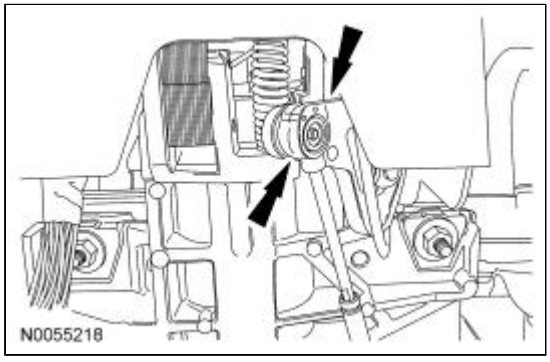


21. Disconnect the steering wheel position sensor electrical connector.

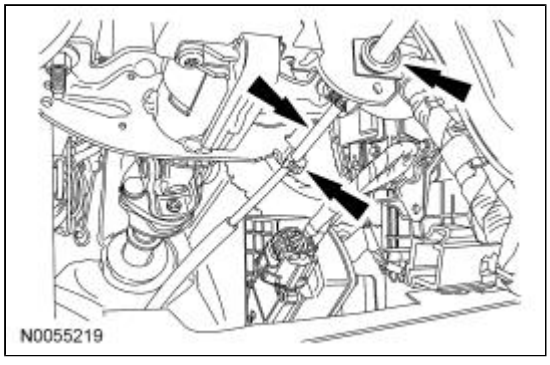


Expedition only

22. Disconnect the steering column shift cable from the shift lever.



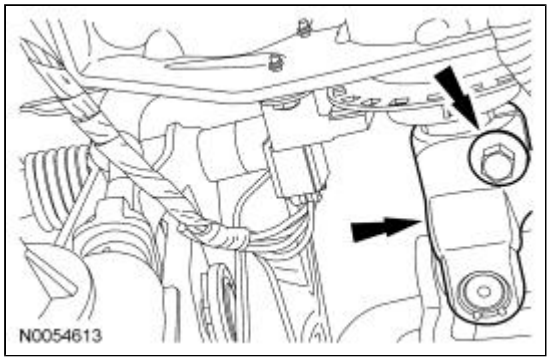
23. Remove the steering column shift cable and position aside.
    - Remove the shift cable from the bracket.
    - Remove the shift cable and retainer from the steering column.



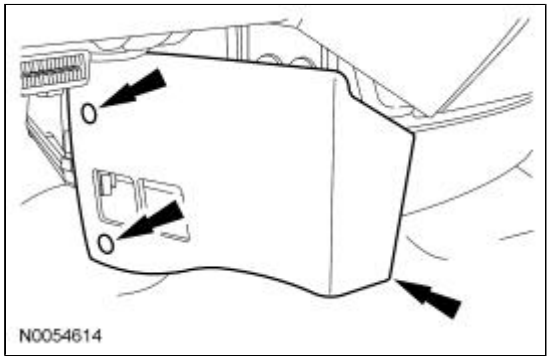
All vehicles

24. **CAUTION: Secure the steering wheel to prevent any rotation or damage to the clockspring.**

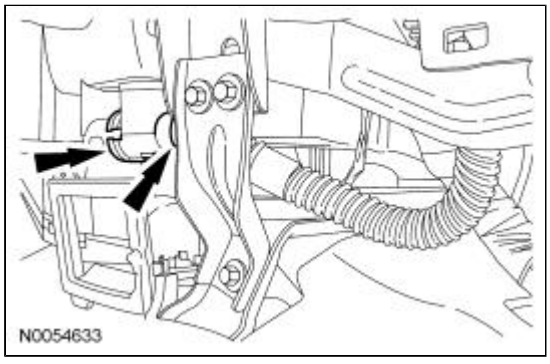
    Remove the pinch bolt and separate the intermediate shaft from the steering column.
    - To install, tighten to 30 Nm (22 lb-ft).



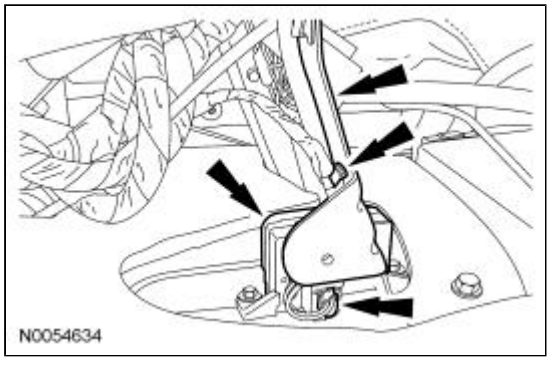
25. If equipped, remove the 3 pin-type retainers and the valance panel.



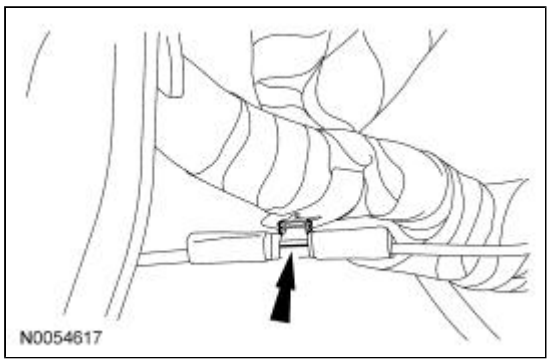
26. If equipped, disconnect the electronic automatic temperature control (EATC) hose from the evaporator case.



27. Disconnect the stability control sensor cluster electrical connector.
    - Disconnect the wiring harness from the console bracket.

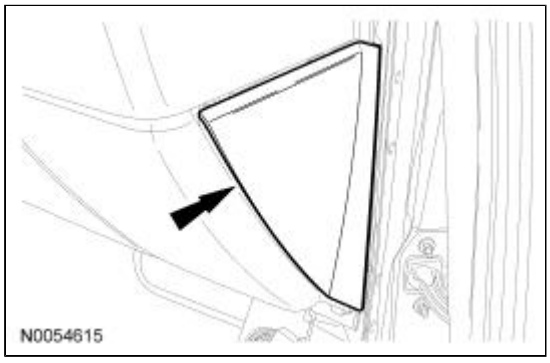


28. Remove the satellite radio antenna from the wiring harness, if equipped.

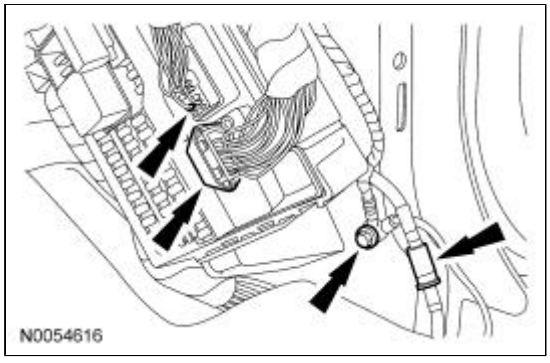


29. **NOTE:** Navigator shown, Expedition similar.

    Remove the RH instrument panel side finish panel.



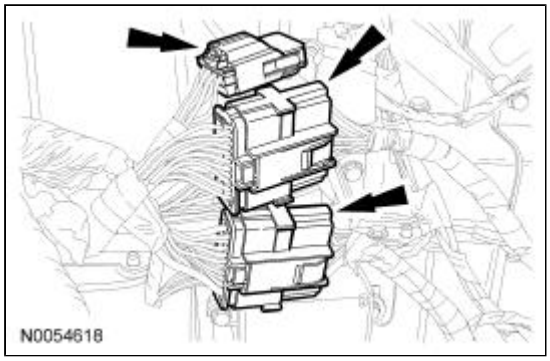
30. Disconnect the RH instrument panel electrical connectors.
    - Disconnect the electrical connectors.
    - Remove the RH ground bolt.
    - Disconnect the in-line antenna connector.



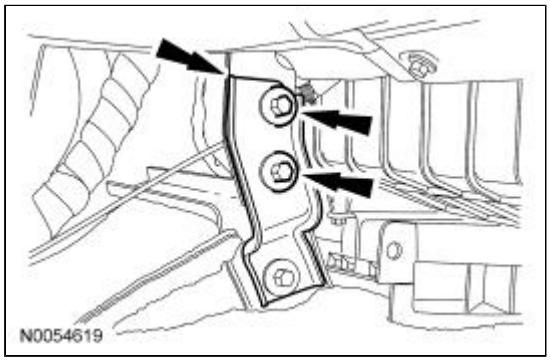
31. Lower the glove compartment.

32. **NOTE:** There are 6 electrical connectors, 3 are shown.

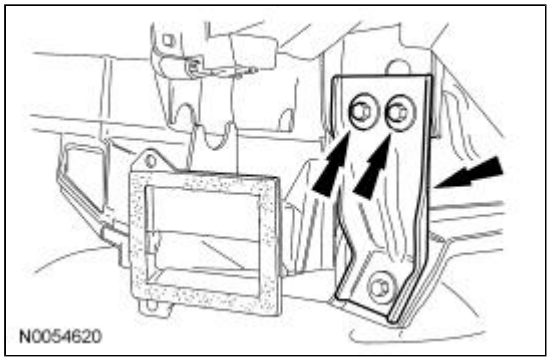
    Disconnect the electrical connectors.



33. Remove the 2 RH instrument panel floor brace bolts.
    - To install, tighten to 9 Nm (80 lb-in).

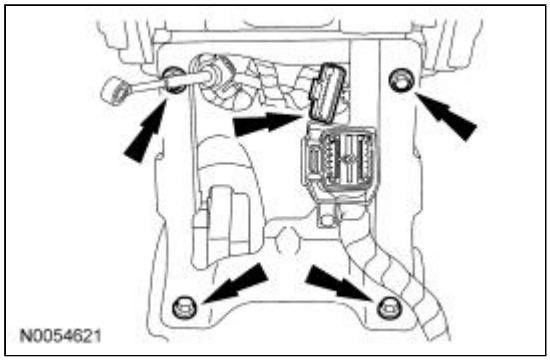


34. Remove the 2 LH instrument panel floor brace bolts.
    - To install, tighten to 9 Nm (80 lb-in).



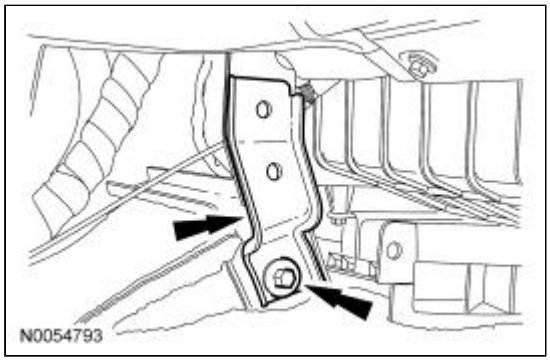
Navigator only

35. Remove the bolts and position the floor console bracket aside.
    - Disconnect the electrical connector from the bracket.
    - Remove the bracket-to-instrument panel bolts.
        - To install, tighten to 9 Nm (80 lb-in).
    - Remove the bracket-to-floor bolts.
        - To install, tighten to 40 Nm (30 lb-ft).



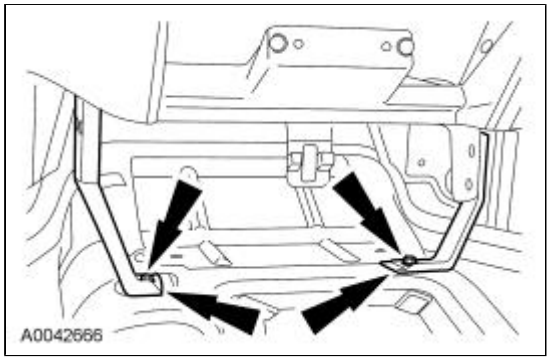
36. **NOTE:** RH brace shown, LH brace similar to Expedition.

    Position the carpet aside, remove the bolts and the instrument panel floor braces.
    - To install, tighten to 9 Nm (80 lb-in).



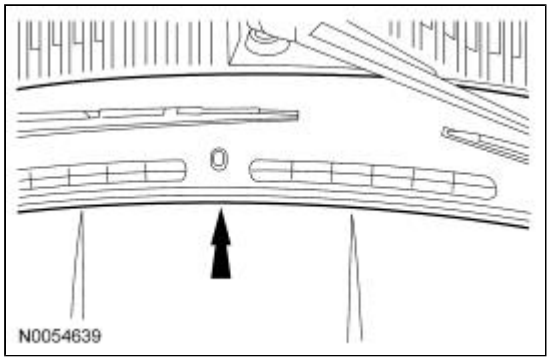
Expedition only

37. Position the carpet aside, remove the bolts and the instrument panel floor brace.
    - To install, tighten to 9 Nm (80 lb-in).

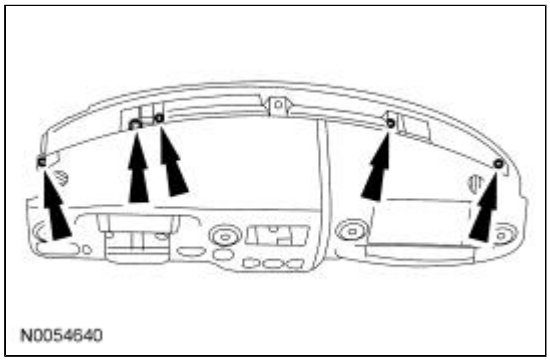


All vehicles

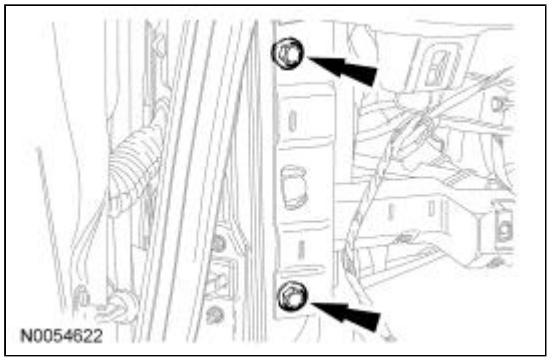
38. Remove the instrument panel defroster grille.



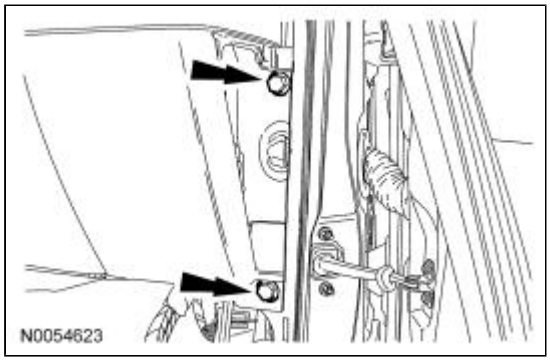
39. Remove the instrument panel cowl bolts.
    - To install, tighten to 30 Nm (22 lb-ft).



40. Remove the LH instrument panel bolts.
    - To install, tighten to 30 Nm (22 lb-ft).



41. Remove the RH instrument panel bolts.
    - To install, tighten to 30 Nm (22 lb-ft).



42. **NOTE:** This step requires an assistant.

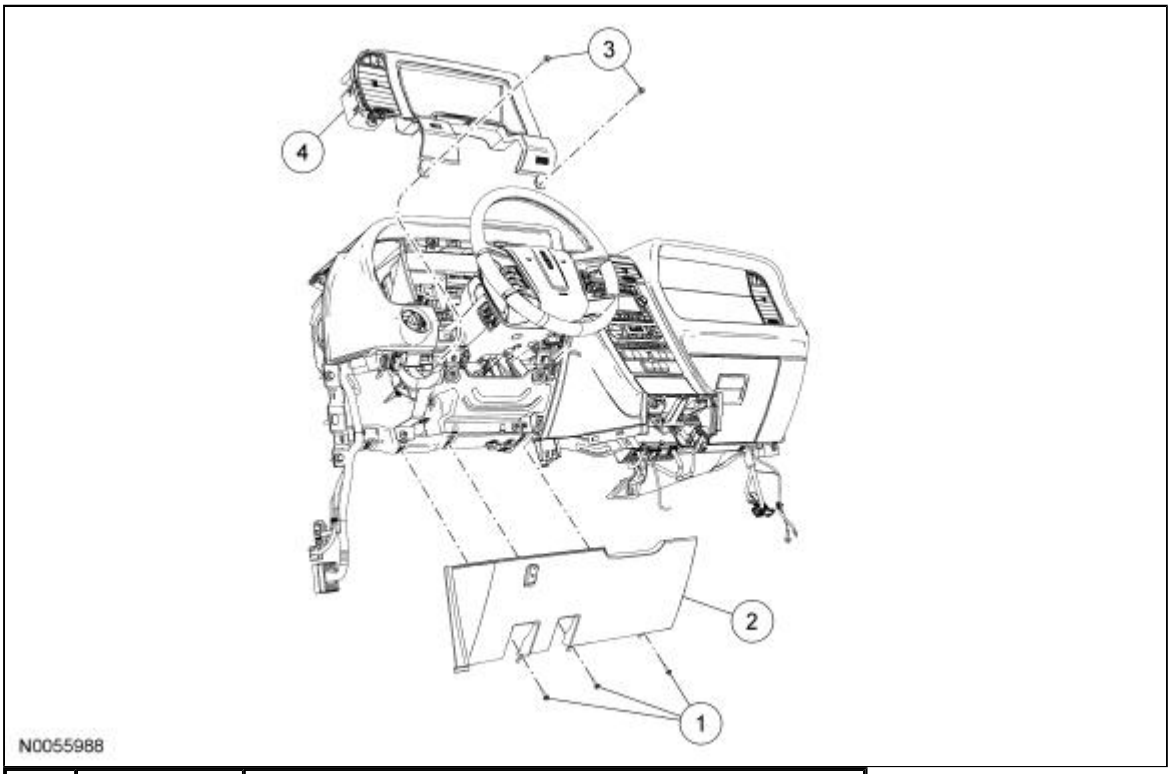
NOTE: Two bullet connectors align the instrument panel to the bulkhead.

Remove the instrument panel.

43. To install, reverse the removal procedure.

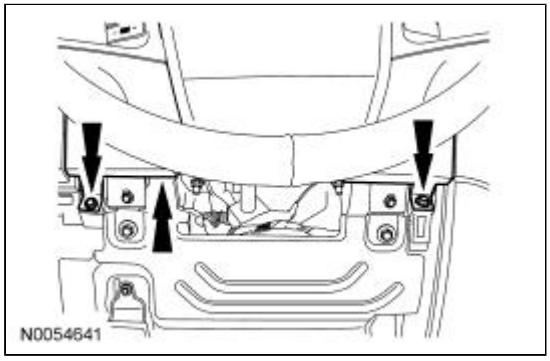
Instrument Cluster Finish Panel — Navigator

Printable View (223 KB)



Item	Part Number	Description
1	W707628	Instrument panel steering column cover screws (3 required)
2	04459	Instrument panel steering column cover
3	W707628	Instrument panel finish panel screws (2 required)
4	04320	Instrument panel finish panel

1. Remove the steering column multi-function switch, refer to Section 211-05 .
2. Remove the 2 instrument cluster finish panel screws.

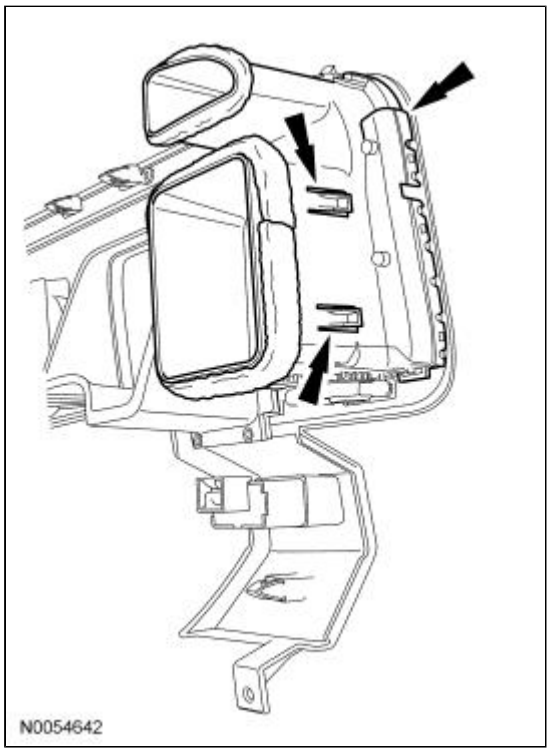


3. **NOTE:** There are 2 locking tabs on the outboard register that need to be depressed before the cluster finish panel is removed.

NOTE: Cluster finish panel removed for clarity.

Depress the 2 locking tabs and remove the cluster finish panel.

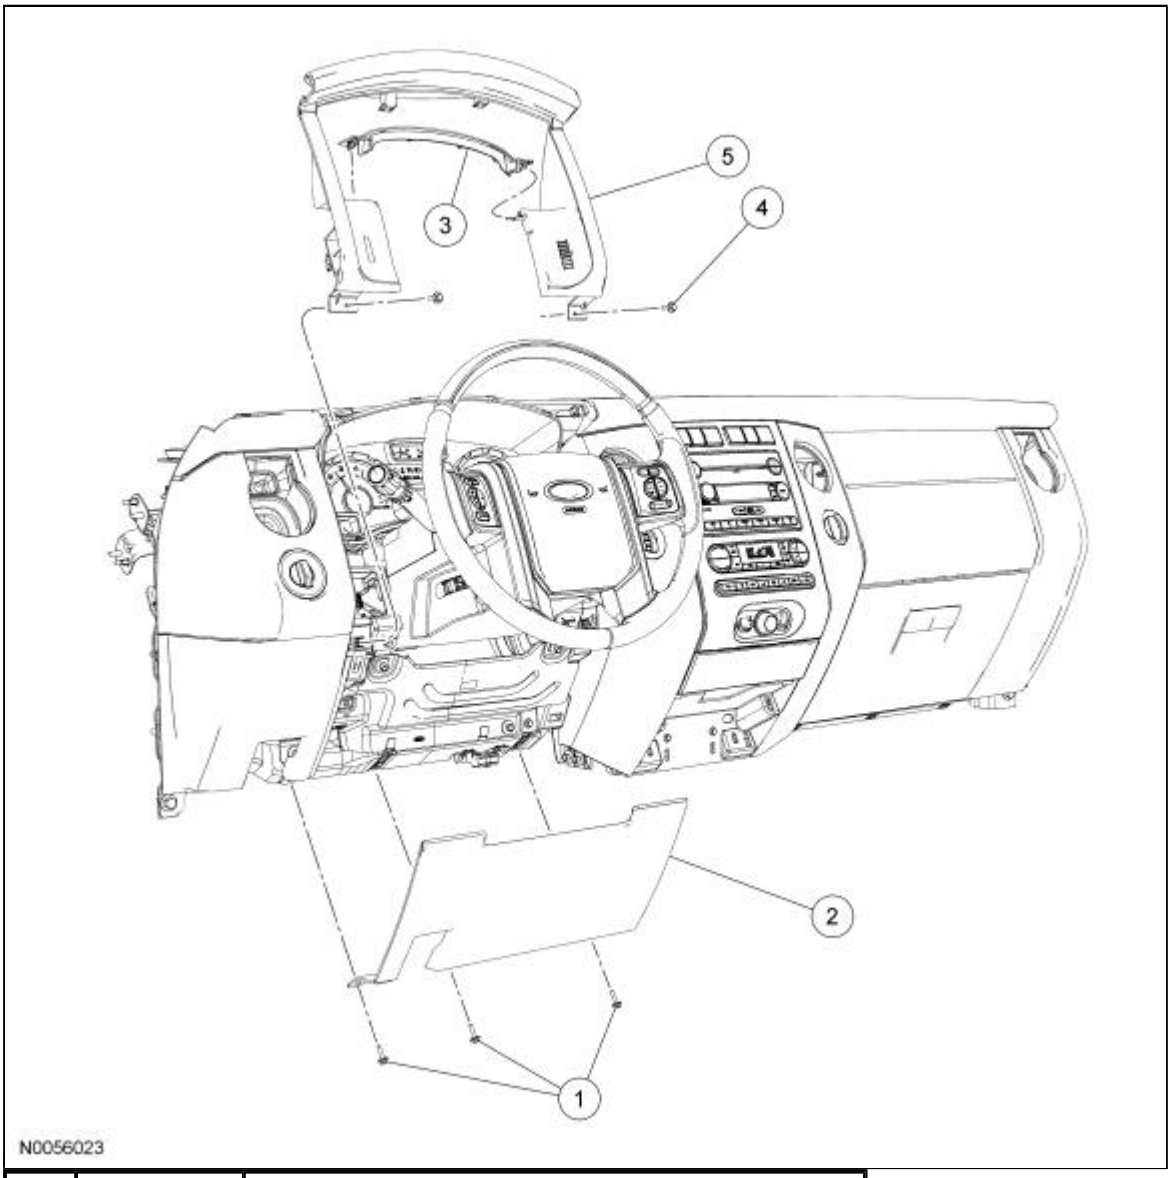
- Access the tabs from under the instrument panel.
- Disconnect the electrical connectors.



4. To install, reverse the removal procedure.

Instrument Cluster Finish Panel — Expedition

Printable View (226 KB)



Item	Part Number	Description

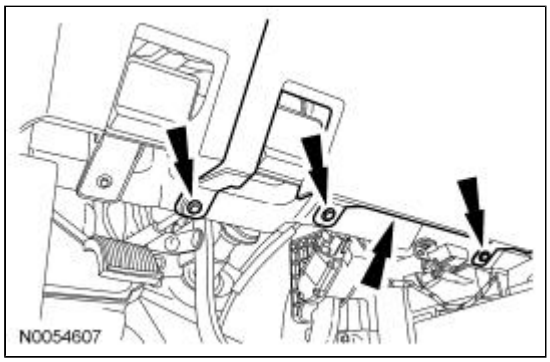
5	04320	Instrument panel finish panel

Column shift vehicles only

1. Place the column shift lever to the 1 position.

All vehicles

2. Remove the instrument panel steering column cover.
    - Remove the 3 instrument panel steering column cover screws.
    - Release the instrument panel steering column cover from the instrument panel.



3. Tilt the steering wheel to the full down position.

4. Remove the instrument cluster finish panel bridge.
    - Pull upward and then left on the LH side of the finish panel bridge to release the retainer and remove the finish panel bridge.

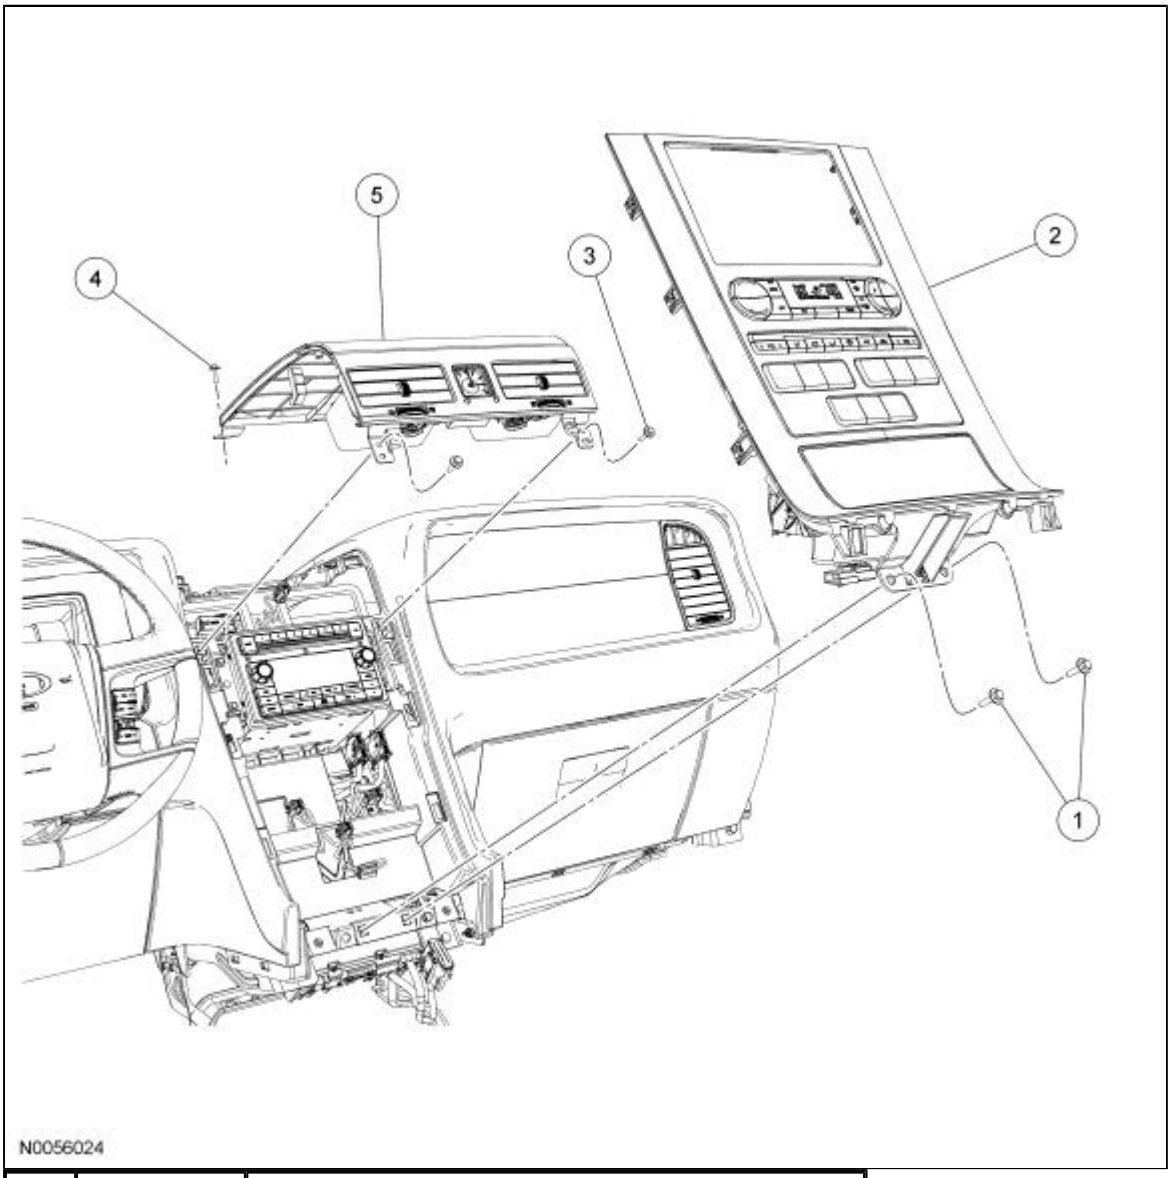
5. Remove the 2 instrument cluster finish panel screws.

6. Remove the instrument cluster finish panel.
    - Pull on the finish panel to release it from the retainers.
    - Disconnect the electrical connectors.

7. To install, reverse the removal procedure.

Instrument Cluster Center Finish Panel — Navigator

Printable View (266 KB)



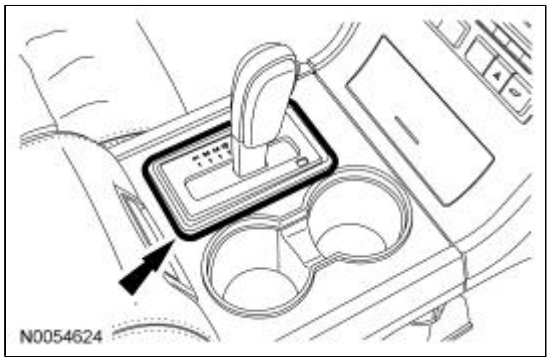
Item	Part Number	Description
1	W707628	Instrument cluster center finish panel screws (2 required)
2	04302	Lower instrument cluster center finish panel
3	W707628	Lower screws (2 required)
4	W704874	Upper screw (2 required)
5	—	Upper instrument cluster center finish panel

Removal and Installation

1. Apply the parking brake and move the shift lever to NEUTRAL.

2. Disconnect the battery. For additional information, refer to Section 414-01 .

3. Remove the shifter trim ring.

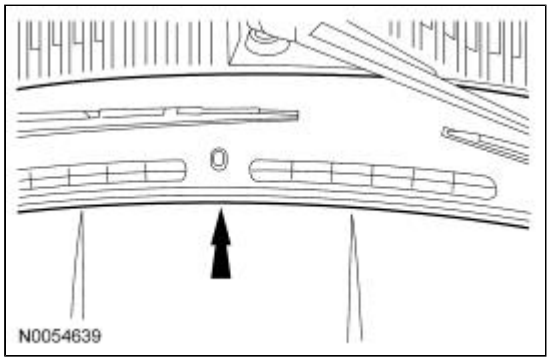


4. Remove the front floor console finish panel.

5. Remove the lower instrument cluster center finish panel.
    1. Remove the instrument cluster center finish panel screws.
    2. Pull out on the panel to disengage the clips.
    - Disconnect the electrical connectors.

6. Remove the 2 lower screws from the upper instrument cluster center finish panel.

7. Remove the instrument panel defroster grille.



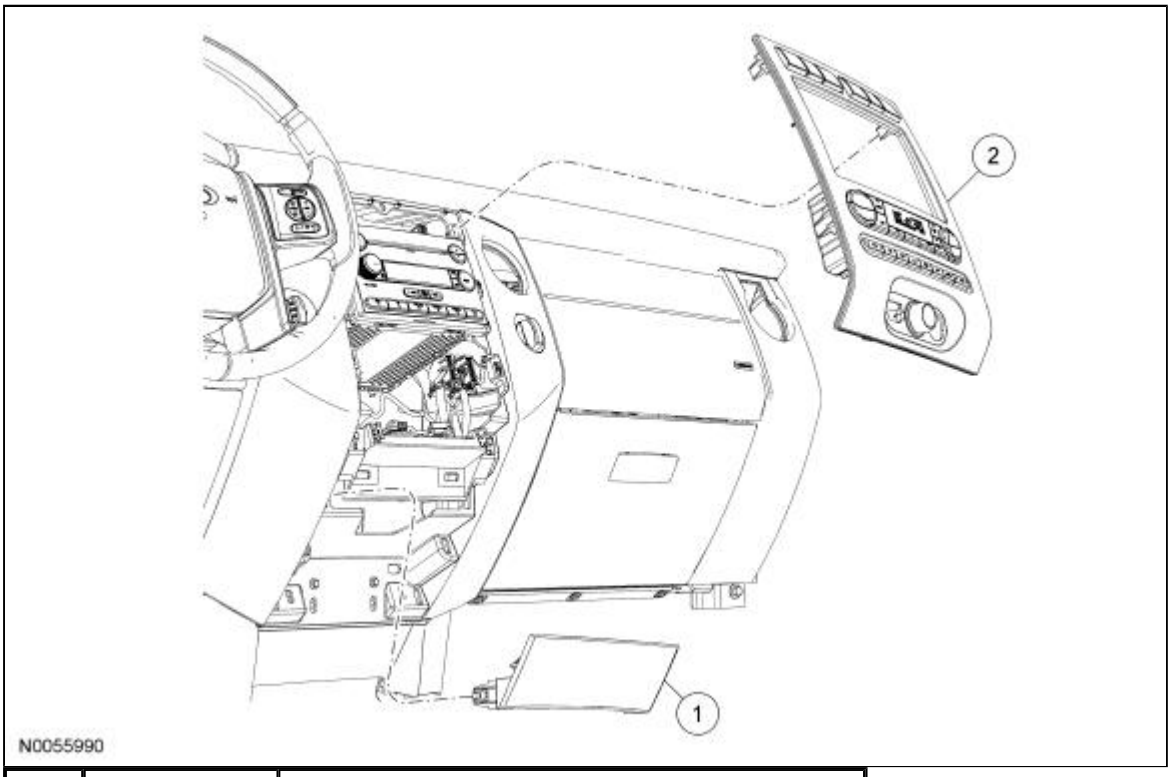
8. Remove the 2 upper screws from the upper instrument cluster center finish panel.

9. Remove the upper instrument cluster center finish panel.
    - Disconnect the electrical connectors.

10. To install, reverse the removal procedure.
    - Transfer parts as needed.

Instrument Cluster Center Finish Panel — Expedition

Printable View (152 KB)



Item	Part Number	Description
1	—	Lower instrument cluster center finish panel
2	04302	Upper instrument cluster center finish panel

1. Remove the lower instrument cluster center finish panel.

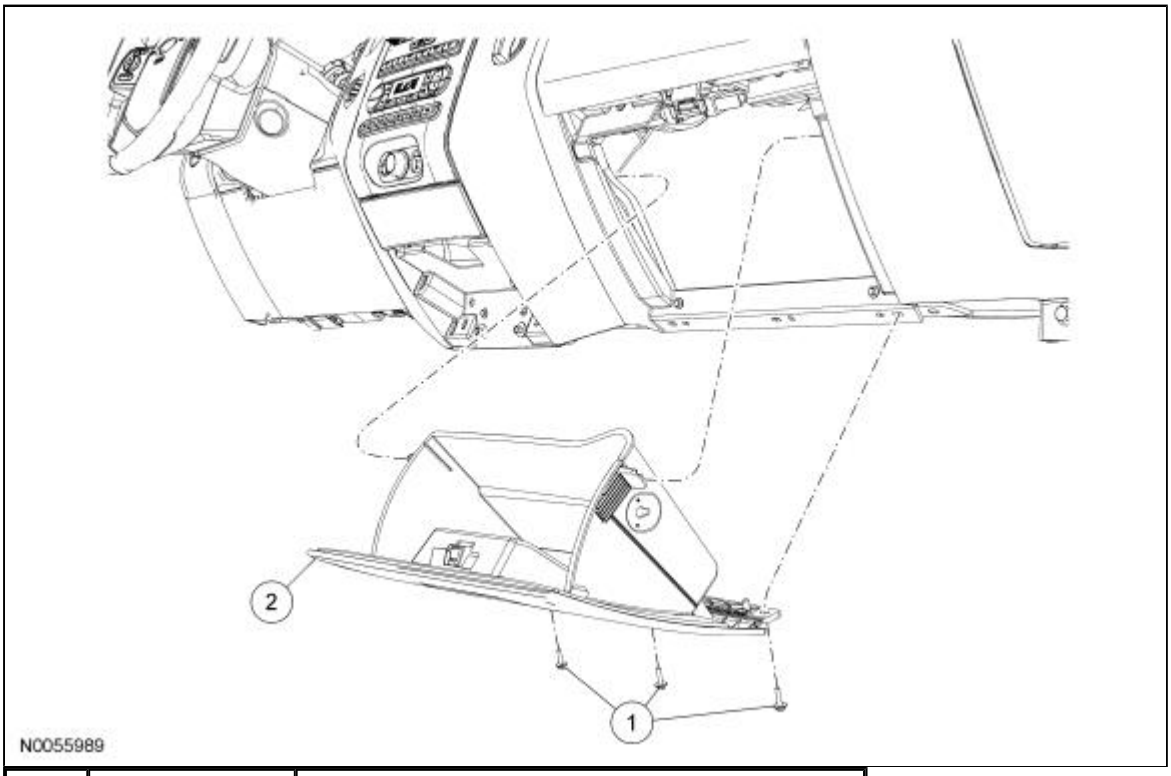
2. Remove the upper instrument cluster center finish panel.
   - Disconnect the electrical connectors.

3. To install, reverse the removal procedure.
   - Transfer parts as needed.

Glove Compartment

Printable View (196 KB)

NOTE: Expedition shown, Navigator similar.

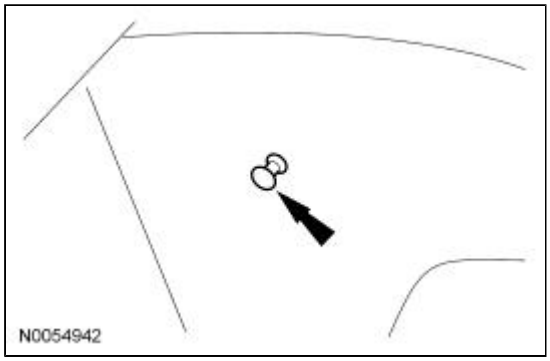


Item	Part Number	Description
1	W707628	Glove compartment screws (3 required)
2	06024	Glove compartment

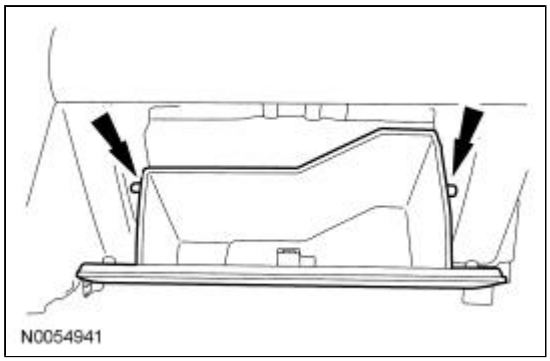
Removal and Installation

1. Open the glove compartment.
2. **CAUTION: Forcing the glove compartment past the stops will damage the dampener.**

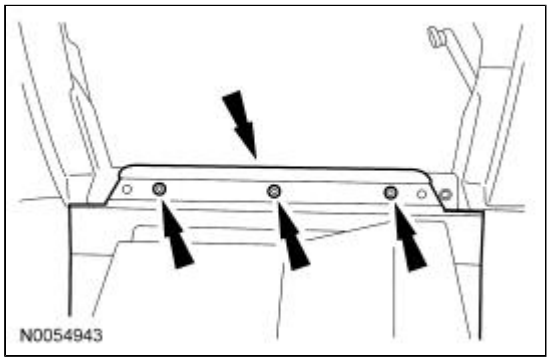
   If equipped, disconnect the dampener.



3. Release the stops.



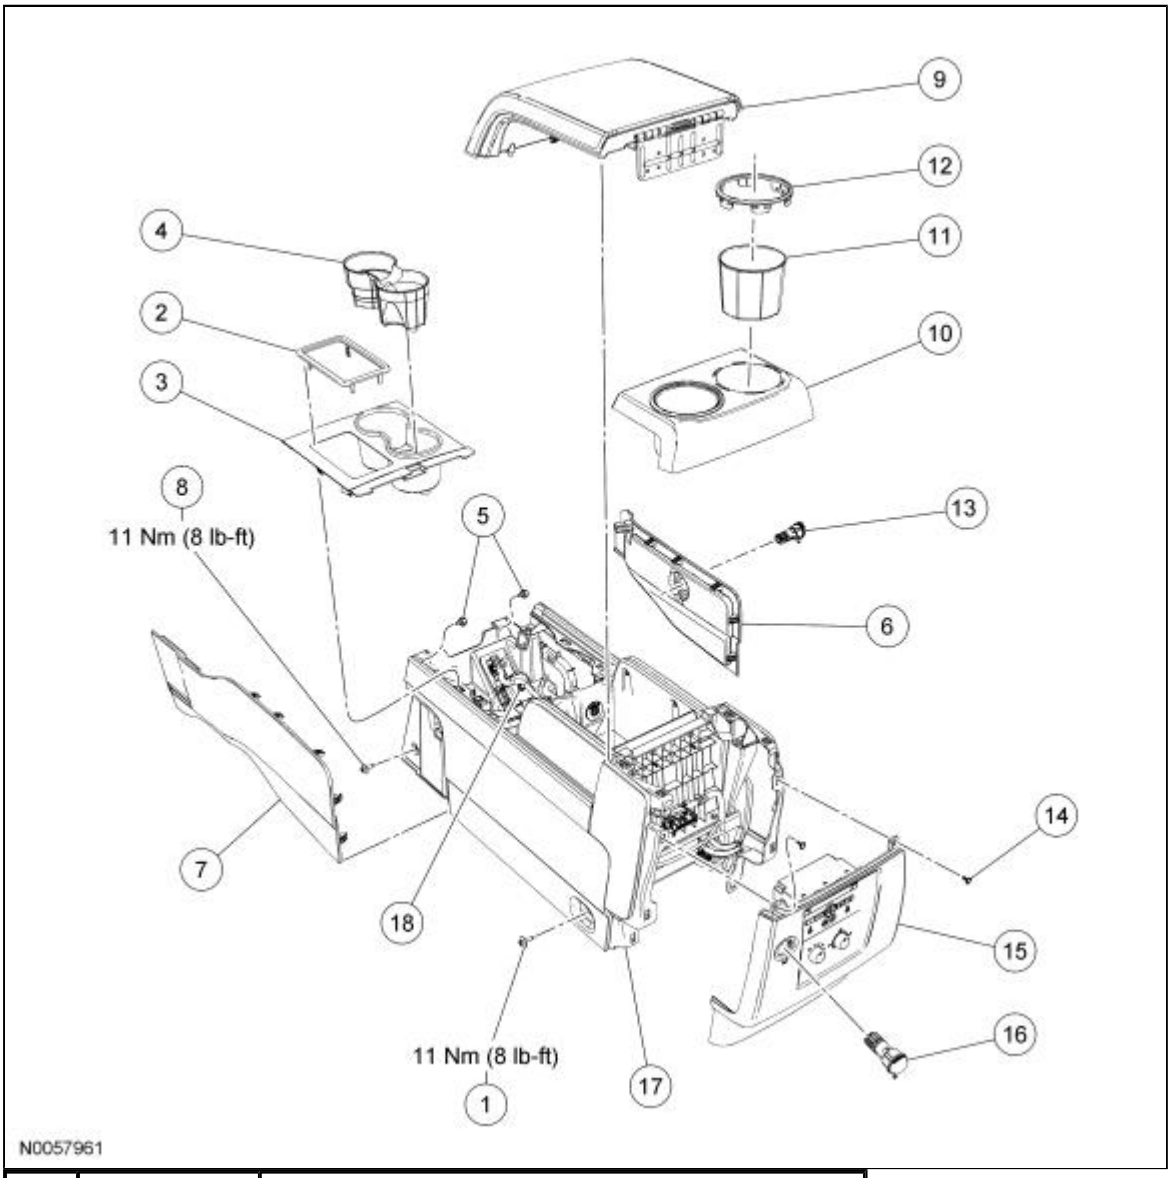
4. Remove the 3 glove compartment screws and the glove compartment.



5. To install, reverse the removal procedure.

Console — Front, Floor, Navigator

Printable View (418 KB)



Item	Part Number	Description

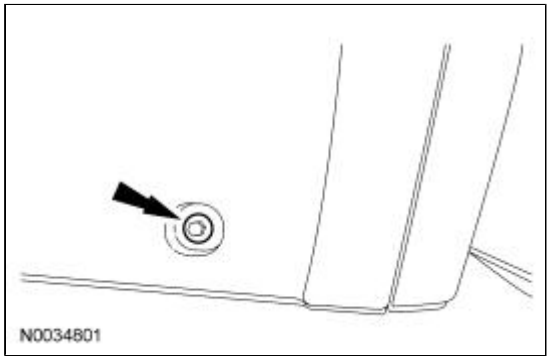
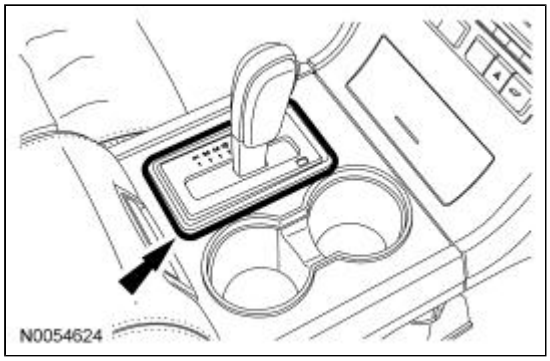
11	—	Rear cup holder insert
12	—	Rear cup holder trim ring
13	19N236	Front floor console front auxiliary power point
14	W710806	Front floor console rear panel screw (2 required)
15	045E24	Front floor console rear panel
16	19N236	Front floor console rear auxiliary power point
17	045A36	Front floor console
18	14B079	Bulkhead electrical connector

Removal and Installation

1. Place the shift lever in NEUTRAL and apply the parking brake.
2. Position the front seat forward.
3. Remove the 2 front floor console rear bolts.
   - To install, tighten to 11 Nm (8 lb-ft).



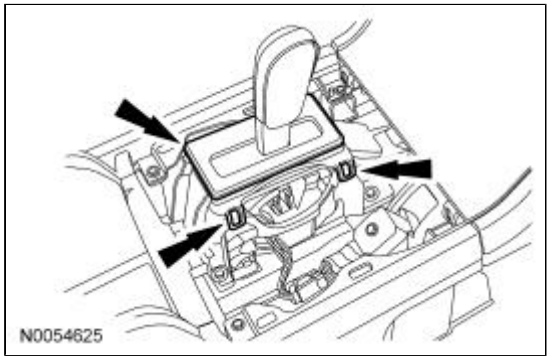
4. Position the front seats rearward.
5. Disconnect the battery. For additional information, refer to Section 414-01 .
6. Remove the shifter trim ring.



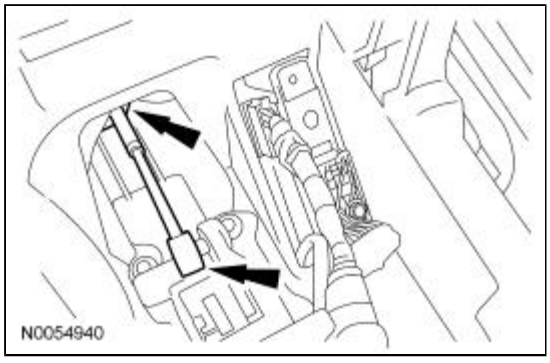
7. Remove the front floor console finish panel.
   - Pull upward on the rear of the finish panel to release the retainers.
8. **NOTE:** RH retainers shown, LH similar.

   Position the shifter lever indicator bezel aside.

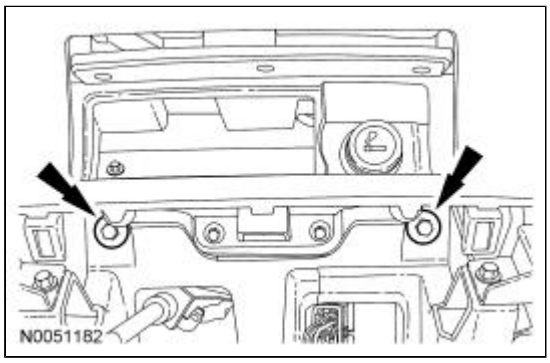
- Release the 4 retainers.



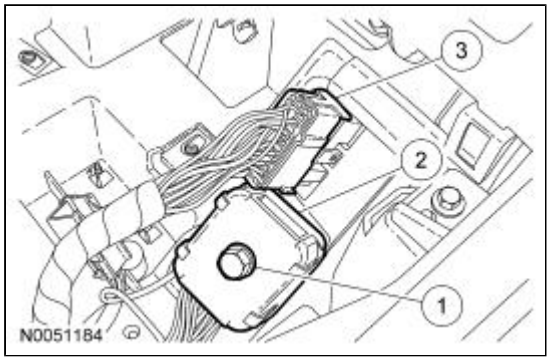
9. Disconnect the shift cable.



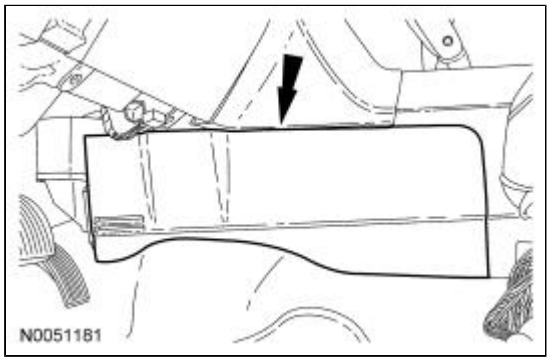
10. Remove the front floor console front screws.
    - To install, tighten to 7 Nm (62 lb-in).



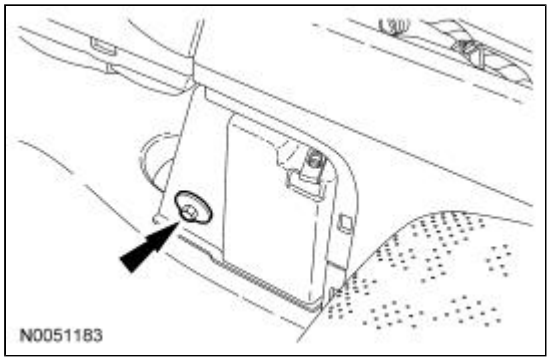
11. Disconnect the front floor console electrical connectors.
    1. Loosen the bulkhead electrical connector bolt.
        - To install, tighten to 3 Nm (27 lb-in).
    2. Disconnect the bulkhead electrical connector.
    3. Disconnect the electrical connector.



12. Remove the LH and RH front floor console side finish panels.
    - If equipped, disconnect the electrical connector.



13. Remove the LH and RH front floor console front bolts and the floor console.
    - To install, tighten to 11 Nm (8 lb-ft).



14. To install, reverse the removal procedure.

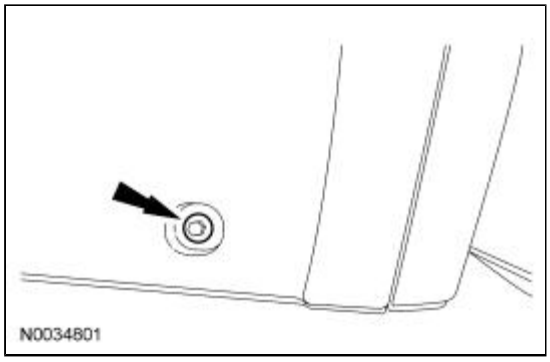
Removal and Installation

1. Place the gear shift lever in NEUTRAL and apply the parking brake.

2. Position the front seat forward.

3. Remove the 2 front floor console rear bolts.
   - To install, tighten to 11 Nm (8 lb-ft).

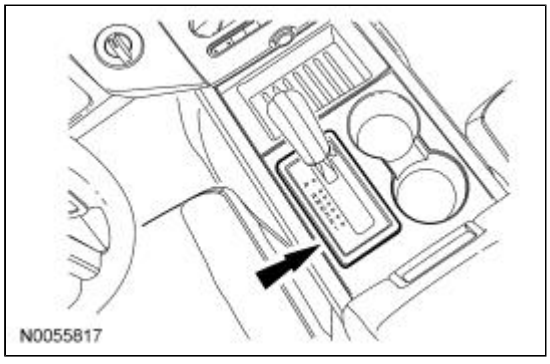


4. Position the front seats rearward.

5. Remove the 2 front floor console front bolts.
   - Remove the 2 bolt covers.
   - Remove the 2 bolts.
     - To install, tighten to 11 Nm (8 lb-ft).

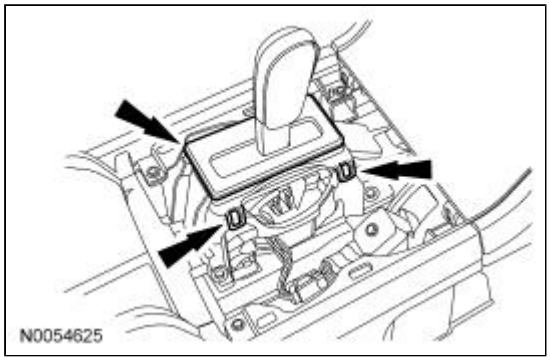
6. Disconnect the battery. For additional information, refer to Section 414-01 .

7. Remove the shifter trim ring.

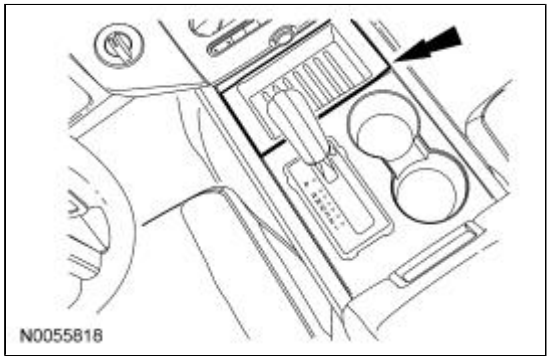


8. **NOTE:** Navigator shown, Expedition similar.

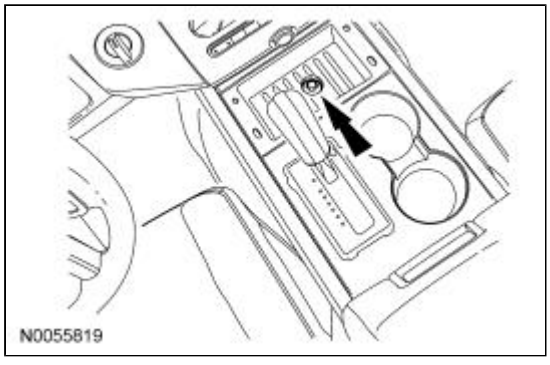
   Position the gear shift lever indicator bezel aside.
   - Release the 4 retainers and position aside.



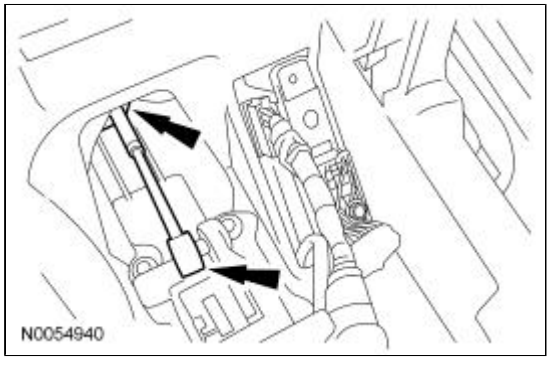
9. Remove the front floor console tray mat.



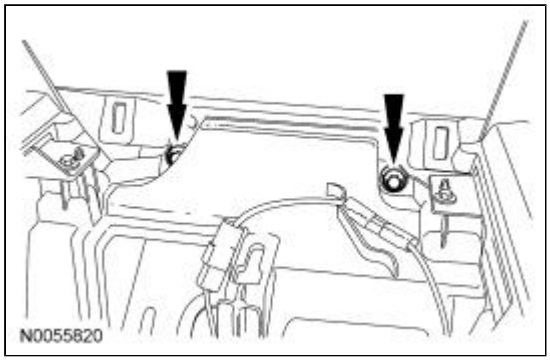
10. Remove the front floor console screw.



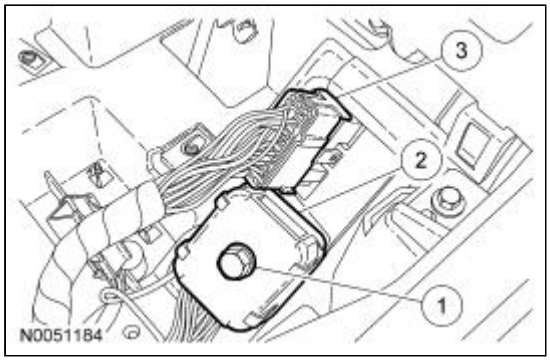
11. Disconnect the shifter cable.



12. Remove the floor console front screws.
    - To install, tighten to 7 Nm (62 lb-in).



13. Disconnect the front floor console electrical connectors.
    1. Loosen the bulkhead electrical connector bolt.
        - To install, tighten to 3 Nm (27 lb-in).
    2. Disconnect the bulkhead electrical connector.
    3. Disconnect the electrical connector.



14. Remove the front floor console.

15. To install, reverse the removal procedure.

Handles, Locks, Latches and Entry Systems

Printable View (109 KB)

The hood latch system contains a latch attached to the upper radiator support (header panel) and a hood latch striker attached to the hood. The latch is controlled by the hood latch release handle and cable.

The front and rear door entry system contains a latch that is attached to the inside of the door frame and is controlled by the exterior and interior door handles. The latch contains the door ajar switch and door lock actuator. The doors can be locked/unlocked by the remote keyless entry (RKE) transmitter, the keyless entry keypad, the door lock control switches or the door lock cylinder (LH front door).

The rear doors have a child safety lock feature, which is a manual override to prevent the door from being opened from the inside door handle. The child safety lock is integral to the rear door latch and is located on the inside of the rear door frame.

Liftgate

The liftgate system contains a latch located on the bottom of the inside frame of the liftgate, which is electronically controlled by the smart junction box (SJB) and (if equipped) the power liftgate module. When the SJB detects the liftgate release handle is pulled, the SJB actuates the liftgate latch. The liftgate release operates only when the doors have been unlocked electronically. The SJB will not release the liftgate if the vehicle speed is greater than 5 km/h (3 mph).

The liftgate window latch is mounted on the upper center portion of the liftgate frame and includes the ajar switch and the latch actuator. The liftgate window latch release is controlled by the SJB. When the SJB detects the release switch is pressed, a request from the RKE transmitter or the correct code from the keyless entry keypad, the SJB actuates the liftgate glass latch release. The liftgate window glass release operates only when the doors have been unlocked electronically.

Power Lock/Unlock

The power lock/unlock feature requests all of the vehicle doors locked or unlocked upon a customer request from either interior door lock switch in the vehicle. The power door locking system functions independently of ignition status or vehicle speed.

Auto-Locking

The auto-locking feature locks all doors when all doors, including the liftgate, are closed, the brake pedal was pressed with the ignition switch in the ON position, and a vehicle speed of 20 km/h (12 mph) or higher is achieved. This feature relocks the doors (if any doors are open) after the brake pedal is pressed, once all doors are read as closed, and the vehicle speed exceeds 20 km/h (12 mph). The auto-locking feature can be enabled/disabled through module configuration, the scan tool, the keyless entry keypad, the instrument panel message center (if equipped), or the ignition switch and the door lock control switch.

Smart Unlock

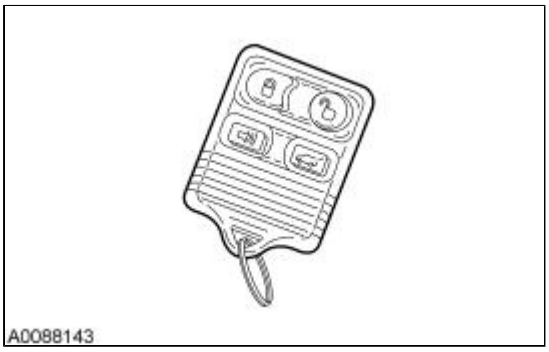
The smart unlock feature prevents the driver door from locking with the key in the ignition lock cylinder. When the SJB receives a LOCK command from a door lock control switch with the key in the ignition lock cylinder and the driver door open, the SJB commands the driver door to UNLOCK.

Remote Keyless Entry (RKE) Transmitter

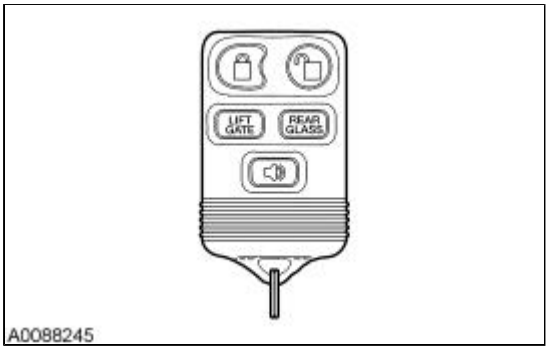
The door locks, release latches, and interior lighting are controlled by the SJB. For additional information

of the interior lighting system, refer to Section 417-02 .

Without Power Liftgate



With Power Liftgate



The RKE transmitter initiates the following electronic system functions:

- Unlocks the driver door (single press of the unlock button)
- Unlocks all doors (second press of the unlock button within 3 seconds)
- Locks all doors
- Releases the liftgate window glass
- Activates/deactivates the panic alarm
- Issues a command to open the power liftgate (if equipped)
- Issues a command to turn on the interior lamps (when unlocking) and off (when locking), provided the defeat switch on the dimmer switch is not active
- Sounds the horn and flashes the turn signals once when LOCK is pressed twice within 3 seconds, and the doors are closed
- Sounds the horn and flashes the turn signals twice when LOCK is pressed twice within 3 seconds, and any door is open

The RKE transmitter has a minimum operating range of 10 m (33 ft).

Up to 4 RKE transmitters can be programmed.

The RKE transmitters can be programmed using a scan tool or by using the remote keyless entry transmitter programming procedure. For additional information, refer to Remote Keyless Entry Transmitter Programming in this section.

Remote Keyless Entry (RKE) Transmitter Lock/Unlock Control — Unlock

The remote control feature provides lock/unlock functions independently of ignition status, vehicle speed, or transmission position. The remote control feature provides a 2-step process for unlocking the doors. Upon receipt of the first request for unlocking the doors, the remote control feature requests the

SJB to unlock the driver door only. If another unlock request is received within 3 seconds of the first, the remote control feature requests that all doors be unlocked.

Remote Keyless Entry (RKE) Transmitter Lock/Unlock Control — Lock

The remote control feature requests that all the doors be locked when the LOCK button is pressed. On any press of the lock button with all doors closed, the remote control feature requests 1 flash of the parking lamps. If any door is ajar, no flash occurs, indicating it locked all the doors but 1 or more doors are ajar. As soon as the last door is closed, 1 flash of the parking lamps occurs. If 2 presses of the lock button are received within 3 seconds, the horn chirps once, and the parking lamps flash twice to indicate that all the doors are closed and locked. If any door is ajar when the second lock request is received within 3 seconds of the first, the remote control feature requests the horn chirp twice without flashing the parking lamps to indicate it locked all the doors, but 1 or more doors are ajar. When the key is in the RUN or START position, no parking lamp flashes or horn chirp confirmations occur.

Panic Alarm

The panic alarm feature controls activation of the panic alarm, providing audible and visual alarms that are evident from the exterior of the vehicle. The panic alarm feature requests that the parking lamps and horn are flashed until deactivation. The flashing of the outputs occurs at the same time. Activation of the panic alarm is accomplished by pressing the PANIC button on a RKE transmitter whenever the key is in the OFF or ACC position. At all other times this feature is disabled. Deactivation of an active PANIC alarm is accomplished by:

- a second press of the RKE transmitter PANIC button.
- the ignition switch transitions out of the OFF or ACC position.
- a period of 2 minutes and 45 seconds has elapsed since the initial activation.

Keyless Entry Keypad

The keyless entry keypad, located on the exterior of the driver door, provides a method for the customer to access the vehicle without a key or RKE transmitter. The keyless entry keypad feature:

- Locks all doors
- Unlocks only the driver door
- Unlocks all doors
- Programs/erases the customer keypad code
- Enables/disables auto-locking
- Enables/disables auto-unlocking
- Releases the liftgate glass

The keyless entry keypad feature operates independently of ignition status, vehicle speed, or transmission position. When a keypad button is pressed, the keypad buttons illuminate to provide better visibility. If 7/8 and 9/0 are pressed or 5 seconds have elapsed since the last button press, the illumination is turned off.

Each vehicle equipped with a keyless entry keypad is programmed with a 5-digit entry code. This code is provided to the customer on a wallet card in the Owner's Literature package. In addition, this code is available through a scan tool. When entering codes, each digit must be entered within 5 seconds of the previous button press.

Anti-Scan Feature

To provide added security, the keyless entry keypad is disabled for 1 minute after pressing the button 35 times without a valid entry code being entered. The keypad flashes during this 1-minute mode with all functionality disabled except for 7/8 and 9/0 still being allowed to lock the vehicle.

Anti-Scan is turned off after any of the following events:

- One minute of keyless entry keypad inactivity has elapsed
- The RKE transmitter UNLOCK button is pressed
- The key is turned to the ON position

Unlocking the Doors with the Keyless Entry Keypad System

To unlock the driver door, enter either the factory set code or the personal code (each digit must be pressed within 5 seconds of the prior digit). This illuminates the interior lamps.

To unlock all doors, enter either the factory set code or the personal code (driver door unlocks) and press the 3/4 button within 5 seconds.

To unlatch the liftgate glass, enter either the factory set code or the personal code (each digit must be pressed within 5 seconds of the prior digit) and press the 5/6 button within 5 seconds.

Locking the Doors with the Keyless Entry Keypad System

It is not necessary to enter the factory set or personal code prior to locking all doors. To lock all doors, press the 7/8 and 9/0 buttons at the same time.

Perimeter Lighting Feature

Vehicles equipped with perimeter lighting can have this feature activated or deactivated.

NOTE: On vehicles with autolamps, the perimeter lighting feature does not activate in daylight conditions.

The following items illuminate when the unlock button on the remote transmitter is pressed:

- Fog lamps (Navigator)
- Headlamps (Expedition)
- Parking, rear and license plate lamps

The lamps turn off:

- if the ignition switch is turned to the RUN position.
- when the lock control on the remote transmitter is pressed
- if the vehicle is locked using the keyless entry keypad
- after 25 seconds have elapsed since the perimeter lighting was activated

Deactivating/Activating Perimeter Lighting Feature

NOTE: The perimeter lighting feature may also be deactivated/activated using a scan tool.

NOTE: Make sure the ignition switch is in the OFF position and all doors are closed before beginning this procedure.

1. Turn the ignition switch from the OFF to the RUN position.

2. Press the unlock button on the door lock control switch 3 times.

3. Turn the ignition switch from the RUN to the OFF position.

4. Press the unlock button on the door lock control switch 3 times.

5. Turn the ignition switch to the RUN position. The horn chirps one time to indicate that

programming mode is entered.

6. **NOTE:** The horn chirps once if the perimeter lighting is disabled or a chirp followed by a honk if the perimeter lighting is enabled.

   Press the unlock button twice within 5 seconds.

7. **NOTE:** The horn chirps once to confirm the procedure is complete.

   Turn the ignition switch from the RUN to the OFF position.

Locks, Latches and Entry Systems

Printable View (415 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

Power Locks

The smart junction box (SJB) monitors the door lock control switches. When the SJB receives an unlock/lock command from either door lock control switch, the SJB energizes a relay (internal to the SJB) to supply the correct power and grounds for the door lock actuators.

Liftgate and Liftgate Glass Release

NOTE: The liftgate latch release is not connected mechanically to the liftgate release handle. The liftgate latch release operates electronically. Pulling on the handle with extra force will not aid in releasing the latch.

The liftgate release handle operates the liftgate latch electronically. When the handle is pulled, a switch is closed, indicating to the SJB to release the liftgate latch.

The SJB monitors the liftgate release switch and the liftgate glass release switch. The doors must be unlocked electronically in order for the SJB to release the liftgate latch or the liftgate glass latch. When this condition is met and the SJB receives a request from the liftgate release handle or the liftgate glass release switch, the SJB provides power to the corresponding latch release motor.

Keyless Entry Keypad

The SJB monitors the keyless entry keypad input. When the correct codes are entered into the SJB, the SJB carries out functions associated with code entered. Based on input from the keypad, the SJB:

- Locks all doors
- Unlocks the driver door
- Unlocks all doors
- Enters programming mode
- Enables/disables the autolock feature
- Enables/disables the auto-unlock feature
- Releases the liftgate glass latch

Remote Keyless Entry (RKE)

The SJB receives input from programmed RKE transmitters. Based on input from the RKE transmitter, the SJB:

- Locks all doors
- Unlocks the driver door
- Unlocks all doors
- Releases the liftgate glass latch
- Activates/deactivates the panic alarm
- If equipped, issues a command to the power liftgate module to open the power liftgate
- Turns the interior lamps on (when unlocking) and off (when locking), provided the defeat switch on the dimmer switch is not active
- Sounds the horn once when LOCK is pressed twice within 3 seconds, and the doors are closed
- Sounds the horn twice when LOCK is pressed twice within 3 seconds, and any door is open

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Door/liftgate handles
• Latches
	• Smart junction box (SJB) fuse(s):
	  ▪ 5 (10A) (keypad)
	  ▪ 17 (20A) (door lock actuators)
	• Door lock actuators
	• Door lock control switches
	• Circuitry
	• Remote keyless entry (RKE) transmitter
	• Keyless entry keypad
	• SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

If the scan tool does not communicate with the VCM:

- Check the VCM connection to the vehicle.
- Check the scan tool connection to the VCM.
- Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB and the power liftgate module.

9. If the DTCs retrieved are related to the concern, go to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1624	Lamp Keypad Output Open Circuit	Go To Pinpoint Test H .
B2276	Less Than 2 Transmitters Programmed	Go To Pinpoint Test I .
B2425	Remote Keyless Entry Out of Synchronization	Go To Pinpoint Test J .
B2666	Liftgate Release Switch Circuit Failure	Go To Pinpoint Test F .
B2667	Liftglass Release Switch Circuit Failure	Go To Pinpoint Test E .
B273A	Liftgate Release Output Circuit Shorted to Ground	Go To Pinpoint Test F .
B273B	Liftgate Release Output Circuit Open or Shorted to Battery Voltage	Go To Pinpoint Test F .
B2A25	Trim Panel Lock Switch Failure	Go To Pinpoint Test C .
B2A26	Keypad Switch Circuit Failure	Go To Pinpoint Test G .
All other DTCs	—	REFER to Section 419-10 .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Circuitry • SJB	• REFER to Section

		418-00 .
• All door locks are inoperative	• Fuse • Circuitry • SJB	• Go To Pinpoint Test A .
• A single/more than one door lock is inoperative	• Circuitry • Door lock actuator • SJB	• Go To Pinpoint Test B .
• The door locks operate only one way	• Circuitry • SJB	• Go To Pinpoint Test C .
• All door locks are inoperative from one switch	• Circuitry • Door lock control switch	• Go To Pinpoint Test D .
• The liftgate glass latch release is inoperative/does not operate correctly	• Fuse • Circuitry • Liftgate glass release switch • Liftgate glass release motor (integral to the liftgate glass latch) • SJB	• Go To Pinpoint Test E .
• The liftgate latch release is inoperative/does not operate correctly	• Circuitry • Liftgate release switch (integral to the liftgate release handle) • Liftgate release motor (integral to the liftgate latch) • Power liftgate module • SJB	• Go To Pinpoint Test F .
• The doors do not lock/unlock using the keyless entry keypad	• Circuitry • Keyless entry keypad • SJB	• Go To Pinpoint Test G .
• The keyless entry keypad illumination is inoperative/does not operate correctly	• Circuitry • Keyless entry keypad • SJB	• Go To Pinpoint Test H .
• The doors do not lock/unlock using the remote keyless entry (RKE) transmitter	• RKE transmitter battery • RKE transmitter • RKE transmitter programming • SJB	• Go To Pinpoint Test I .
• The remote keyless entry (RKE) transmitter is out of synchronization	• RKE transmitter • RKE transmitter button pressed a substantial amount of times while outside the range of the vehicle • SJB	• Go To Pinpoint Test J .
• The panic feature is inoperative/does not operate correctly	• Horn system • Parking lamps system • RKE transmitter • SJB	• Go To Pinpoint Test K .
• The remote keyless entry (RKE) transmitter has poor range performance	• Environmental interference • RKE transmitter battery • RKE transmitter • SJB	• Go To Pinpoint Test L .

Pinpoint Tests

Pinpoint Test A: All Door Locks Are Inoperative

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

Normal Operation

The smart junction box (SJB) fuse 17 (20A) provides voltage for the power lock/unlock system. Ground for the power lock/unlock system is provided to the SJB through circuit GD138 (BK/WH). The SJB contains internal relays that are energized depending on input received.

When the SJB receives a lock request from the door lock control switch, the SJB provides power to the door lock actuators through circuit CPL11 (GY/BN). Ground for the LH front door actuator is provided through circuit CPL51 (BU/GN) and ground for the remaining door lock actuators is provided through circuit CPL52 (VT/GY). When the SJB receives an unlock request, power and ground are reversed on the previously listed circuits.

Possible Causes

- Fuse
- Circuit GD138 (BK/WH) open
- Circuit CPL11 (GY/BN) open
- SJB

PINPOINT TEST A: ALL DOOR LOCKS ARE INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
A1 VERIFY THE OPERATION OF BOTH DOOR LOCK CONTROL SWITCHES	
• Press the lock and unlock button of both door lock control switches while observing the door lock operation. • **Are the door locks inoperative from both switches?**	**Yes** GO to A2 . **No** Go To Pinpoint Test D .
A2 VERIFY ALL DOOR LOCKS ARE INOPERATIVE	
• Press the lock and unlock buttons from the door lock control switch while observing the door locks. • **Are all the door locks inoperative from both switch positions (lock and unlock)?**	**Yes** VERIFY the SJB fuse 17 (20A) is OK. If OK, GO to A3 . **No** GO to Symptom Chart .
A3 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Key in OFF position. • Disconnect: SJB C2280e. • Measure the resistance between the SJB C2280e-7, circuit GD138 (BK/WH), harness side and ground.	**Yes** GO to A4 . **No** REPAIR the circuit. TEST the system for normal operation.

 N0058774 • **Is the resistance less than 5 ohms?**	
A4 CHECK CIRCUIT CPL11 (GY/BN) FOR AN OPEN	**Yes** GO to A5 . **No** REPAIR the circuit. TEST the system for normal operation.
• Disconnect: LH Front Door Lock Actuator C525. • Measure the resistance between the SJB C2280e-6, circuit CPL11 (GY/BN), harness side and the LH front door lock actuator C525-1, circuit CPL11 (GY/BN), harness side.  N0060170 • **Is the resistance less than 5 ohms?**	
A5 CHECK FOR CORRECT SJB OPERATION	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
• Disconnect all the SJB connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	

Pinpoint Test B: A Single/More Than One Door Lock Is Inoperative

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

Normal Operation

When the smart junction box (SJB) receives a lock request from the door lock control switch, the SJB provides power to the door lock actuators through circuit CPL11 (GY/BN). Ground for the LH front door actuator is provided through circuit CPL51 (BU/GN) and ground for the remaining door lock actuators is provided through circuit CPL52 (VT/GY). When the SJB receives an unlock request, power and ground are reversed on the previously listed circuits.

Possible Causes

- Circuit CPL11 (GY/BN) open

- Circuit CPL51 (BU/GN) open
- Circuit CPL52 (VT/GY) open
- Door lock actuator
- SJB

PINPOINT TEST B: A SINGLE/MORE THAN ONE DOOR LOCK IS INOPERATIVE

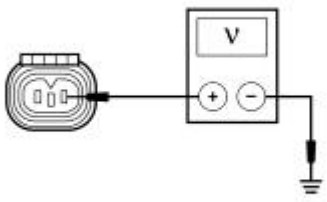
CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use correct probe adapter(s) may damage the connector.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>B1 CHECK CIRCUIT CPL11 (GY/BN) FOR AN OPEN</td><td rowspan="2">Yes
GO to B2 .

No
REPAIR the circuit. TEST the system for normal operation.</td></tr>
<tr><td>

Key in OFF position.
Disconnect: Inoperative Door Lock Actuator.
NOTE: The SJB only supplies voltage to the actuator momentarily. It is important to monitor the meter while pressing the door lock control switch.
While pressing the door lock control switch in the LOCK position, measure the voltage between the inoperative door lock actuator, harness side and ground as follows:

<table>
<tr><th>Inoperative Door Lock Actuator</th><th>Connector-Pin</th><th>Circuit</th></tr>
<tr><td>LH front</td><td>C525-1</td><td>CPL11 (GY/BN)</td></tr>
<tr><td>RH front</td><td>C603-1</td><td>CPL11 (GY/BN)</td></tr>
<tr><td>LH rear</td><td>C704-1</td><td>CPL11 (GY/BN)</td></tr>
<tr><td>RH rear</td><td>C804-1</td><td>CPL11 (GY/BN)</td></tr>
</table>



N0058776

Is the voltage greater than 10 volts when the lock switch is pressed?

</td></tr>
<tr><td>B2 CHECK CIRCUIT CPL52 (VT/GY) OR CIRCUIT CPL51 (BU/GN) FOR VOLTAGE</td><td rowspan="2">Yes
INSTALL a new door lock actuator. REFER to Door Lock Actuator in this section. TEST the system</td></tr>
<tr><td>

NOTE: The SJB only supplies voltage to the actuator momentarily. It is important to monitor the meter while pressing the door lock control switch.
